"I am desired, on the part of my committee and myself, to thank your Lordship most warmly and all those who have co-operated with you and are subscribing so nobly to relieve the distress in India. We have now received estimates most carefully prepared by branch committees who have cut them down to the lowest figure. The total comes to 166 lakhs of rupees, but we estimate even this will not suffice. The receipts up to date are 106 lakhs, so every additional donation will be very thankfully received. The North-West Provinces and Oudh are worst off. In both areas there is intensity of famine, as parts of them have suffered from bad harvests for two or three seasons. Their latest returns show 1,250,000 persons employed on Government works at famine wages and 330,000 gratuitously relieved by subsistence dole. Sir John Edge and Mr. Deas are presidents. Two strong committees are sitting at Lucknow and Allahabad, and a great number of local committees have been formed under them throughout the distressed districts, and a large body of voluntary associations and poorhouse committees formerly existing—some founded last autumn—have been affiliated. Following illustrate system of relief. Large sum has been spent on making purchases of clothes for poor creatures on relief works, many of whom came almost naked. Allahabad (city) has been divided into six wards, which are controlled by committees of leading native gentlemen, who prepare careful lists of those needing relief and balance accounts of almoners. Every precaution is taken to husband money and not scatter it broadcast. In the Allahabad district there are large numbers of Brahmin landholders who would perish rather than take their families to relief works to associate with persons of lower castes. Timely relief received has enabled committee to provide for their women and children, and leave at liberty men to earn subsistence by working, however distasteful that be to them. Distress has been nowhere more acutely felt than in the city of Lucknow, comprising descendants of impoverished Mahomedan families, whose women make a living by embroidery and sewing, and the demand for whose handiwork ceased since the beginning of the famine. This city is mapped into 36 circles, and probably 30,000 rupees will be required for six or seven months to come solely for these classes. An average of one and a half rupee per head or under 2*s.* per month was at end of February being given to 12,300 persons, but the number must increase every month. Sir John Edge's committee, after consulting with Sir Anthony Macdonnell, think at least 40 lakhs will have to be spent in May to start once more in life ryots who have lost all, so as to enable them to plough and sow as soon as the monsoon arrives and to exist until the crop ripens. Embroiderers and weavers are being supplied with materials which local committees buy, paying them for the work. In parts of Central Provinces, especially where the soil is sterile, the people are as badly off as in North-West Provinces, and over 300,000 persons are on works, 67,000 on gratuitous relief. Vast majority of these are described by the provincial committee as in the lowest depth of poverty and privation, and the addition of small comforts in the shape of food or clothing to cover naked bodies of both sexes is most welcome relief. All concerned have been too busily engaged saving life to write many reports, but now organisation is complete I hope to send your Lordship brief weekly accounts describing operations, both in affected British Provinces and native States. The Government of India have kindly lent my committee the services of Hon. Mr. James, Commissioner in Sind, as vice-chairman. He will leave next week to confer with provincial committees and report how relief operations progress, not only in the typical districts like North-West and Central Provinces, but in the parts of Behar, Bengal, Madras, and Bombay, wherever there is famine. Fifty lakhs received from Mansion Hosue relief and other parts of the world have been already distributed by provincial committees; the rest will be given as

required. Would you kindly transmit copies of this to Lord Provosts of Edinburgh and Glasgow, the Lord Mayor of Liverpool, and Lord Derby, whose committees have been just as kind and liberal.

"SIR FRANCIS MACLEAN.

"To the Right Honourable the Lord Mayor,
Mansion House."

EXTRACT from the "TIMES" of 8th April 1897.

The Lord Mayor yesterday received the following telegram from Sir Francis Maclean, Chief Justice of India and chairman of the Central Relief Committee at Calcutta:—

"Provisional committees anxiously asking Central Committee what funds they may rely upon receiving. Total sum raised up to date, including funds specially given to particular provinces, is crore seven, lakhs 18,402. Can you tell me how much collected at Mansion House and Lancashire not yet remitted? In Bengal distress expected to last till November. Consequently local committees are husbanding their resources. Expenditure mainly on relief of respectable poor and purdar-nishin women. Indigent agriculturists mostly working on State relief works. In Bombay relief required till September, but special assistance in giving small agriculturists a fresh start will not be required until June, July, and August. Assistance has been given to distressed in native States. We are deeply grateful to our countrymen for their splendid response to our appeal.

"SIR FRANCIS MACLEAN."

From SECRETARY OF STATE to VICEROY.

March 31, 1897.

Famine. Please telegraph next Saturday total amount of subscriptions received up to date by Central Committee from (1) Lord Mayor's Fund, (2) other subscriptions United Kingdom, (3) British Colonies, (4) India, (5) Russia. Parliamentary question,* Monday 5th April. Maclean's telegram to Lord Mayor does not agree with yours of 11th March as to sum required for Famine Fund. Can you explain discrepancy?

From VICEROY.

April 3, 1897.

Your telegram of 31st March. Total subscriptions Indian Famine Fund as follows:—Mansion House, Rs. 57,89,600; remainder of United Kingdom, Rs. 29,34,400; British Colonies, Rs. 6,00,700, of which Canada, Rs. 4,00,000; India, Rs. 12,75,700; Russia, *nil*; other parts of the world, Rs. 75,700; grand total, Rs. 1,06,76,100. Maclean's estimate of 166 lakhs exceeds our estimate of 11th March, which was prepared in consultation with Central Committee, owing to increased and revised estimates by Branch Committees, and to provision for Native States.

CENTRAL PROVINCES.

No. C.—138, dated Camp Chhindwara, the 20th January 1897.

From H. H. PRIEST, Esq., I.C.S., CHIEF SECRETARY TO THE CHIEF COMMISSIONER, Central Provinces, to the SECRETARY TO THE GOVERNMENT OF INDIA, DEPARTMENT OF REVENUE AND AGRICULTURE.

In the Provincial Cash Requirement Estimate for 1897–8 (forwarded to the Comptroller with this office letter No. 4298, dated the 9th November 1896) a sum of 5½ lakhs of rupees was shown as the estimated provincial expenditure on Land Improvement Loans (1 lakh) and Agricultural Loans (4½ lakhs).

---

* *See* page 8 of previous "Further Papers" [C.—8302 of 1897].

2. In forwarding this estimate it was stated that, owing to the impending general scarcity, an accurate forecast was impossible and that the above estimate of requirements was to be regarded as approximate only.

Since these estimates were prepared in November last, the extent and probable duration of the scarcity in these Provinces have become much more accurately known than was possible at that time, and the Chief Commissioner believes that the allotment of considerably larger sums than those previously asked for will be necessary if the Provinces are to be safely tided over the present critical period of distress, and if confidence and prosperity are to be restored.

3. Mr. Lyall understands from your letter No. 111—27-23 F., dated the 4th instant, that there may be some difficulty in providing funds for ordinary Land Improvement Loans, as distinct from advances for the relief of distress. He trusts, however, that a moderate amount may still be allowed for expenditure on this purpose during the financial year 1897–98. There are many parts of the Province where there is not at present any acute distress, but where high prices and the strain caused by the contraction of ordinary openings for labour resulting from those prices have rendered it particularly desirable that some such employment should be afforded to the labouring classes as is commonly supplied by works executed from Land Improvement Loans. Such work, in these tracts, will not be strictly famine relief, because the persons employed may be expected to be quite capable of, and willing to render piece-work or even work on contract; but the relief afforded to them will be very great, and will probably obviate the necessity of regular relief measures being undertaken. On the other hand, in such tracts, there is no doubt that landowners will be willing to take loans on ordinary terms, and will need no such remission of interest or of a part of the principal as is provided for in the loans sanctioned for famine relief. The Chief Commissioner anticipates that in such tracts it may be found possible to dispense altogether with the ordinary procedure of relief under the Famine Code, with its expensive establishments and ineffective employment of labour, if such loans are given to landowners desirous of obtaining them. If, however, they are withheld, he thinks it probable that it will be necessary to employ the regular relief machinery for at least a portion of the year, at much greater cost than would be involved in the grant of the loans. Before, however, submitting a revised estimate, he desires me to inquire whether the Government of India intend by their orders of the 4th instant to definitely forbid the grant of ordinary Land Improvement Loans on the usual terms in any part of the Central Provinces during the coming financial year. He understands that in the North-Western Provinces and Oudh such loans have been promised for that period, and he would respectfully submit that they are no less necessary here.

4. As regards loans under the Agriculturists' Loans Act, 1884, for the purchase of seed and plough cattle, such loans have, of recent years, played an increasing part in the agricultural economy of these Provinces. Large advances of this kind have been made, under the special sanction of the Government of India, in the districts of the Jubbulpore Division; and in other districts also the timely distribution of advances for seed has enabled much land that would otherwise have remained unsown to be put under a crop. Had it not been for the allotment available this year for agricultural loans, much of the benefit which has resulted from the November rainfall would have been lost, and much of the fine crops of wheat in the plateau districts of Seoni and Chhindwara through which Mr. Lyall has just passed would not be in existence. As already stated, the amount asked for at the beginning of November on this account was 4½ lakhs; but the Chief Commissioner is now assured that in many parts of the country, particularly in the great rice districts of Nagpur and Chhatisgarh divisions, there will be an active demand for seed loans on the prompt granting of which, well in advance of the time of sowing, the return of agricultural prosperity will mainly depend. He trusts, therefore, that he may expect a liberal allotment on this account.

5. The Chief Commissioner has no doubt that the charitable fund inaugurated at the Calcutta meeting of the 13th instant, will contribute largely towards the necessary outlay on seed to cultivators who have been impoverished by famine; but it is as yet uncertain how much of that fund will be available for this Province; and as the duty of meeting a demand for seed grain in special cases has hitherto been accepted by Government, he hopes that he will receive contributions to the Provincial Loan Account which will enable him to satisfy the requirements of cultivators who may be suitable recipients of such loans, and yet not sufficiently impoverished to need the gratuitous assistance which the charitable fund aims at providing.

As at present advised, he would put the amount which might be usefully disposed of under the Agriculturists' Loans Act, 1884, during 1897-98 as at least 10 lakhs instead of the 4½ lakhs originally estimated.

No. 493 F., dated Calcutta, the 9th February 1897.

From T. W. HOLDERNESS, Esq., C.S., DEPUTY SECRETARY TO THE GOVERNMENT OF INDIA, to the CHIEF COMMISSIONER OF THE CENTRAL PROVINCES, DEPARTMENT OF REVENUE AND AGRICULTURE.

I am directed to acknowledge the receipt of Mr. Priest's letter No. C. 138, dated 20th January 1897, in which it is represented that much larger sums under the heads of Land Improvement Loans and Agricultural Loans than those* shown in the Cash Requirement Estimate of the Provinces for 1897-98 will be required in the coming year if the Provinces are to be tided over the present critical period of distress and if confidence and prosperity are to be restored. It is stated that at least 10 lacs will be required under the Agriculturists' Loans Act. A revised estimate of the amount required under the Land Improvement Loans Act is not submitted, but you inquire whether the Government of India intend by their orders of the 4th January to definitely forbid the grant of ordinary Land Improvement Loans on the usual terms in any part of the Central Provinces during the coming financial year.

2. The Government of India recognise the importance of advances for seed in a time of distress and will endeavour to make a liberal allotment for the purpose to the Central Provinces in the budget estimates for 1897-98. It may not, however, be possible to provide the full amount asked for by you, having regard to the requirements of other provinces and to the general financial situation. Relatively to the Land Revenue of the Provinces the amount is large, and the Government of India would be glad to receive more particulars of the information upon which the estimate is based.

3. With regard to Land Improvement Loans it is unlikely that any large sum for this purpose can be provided for the Provinces under the usual head in the estimates for 1897-98. It is not required for purposes of land improvement as distinguished from famine relief, and the Government of India think that all that you wish to do to provide employment in districts in which distress is not acute, and thereby to obviate the necessity of undertaking regular relief works, can be done by the grant of advances in accordance with the principles explained in the papers accompanying the Government of India's letter No. 111, dated 4th January 1897. It was not intended that the grant of such advances should be restricted to districts in which the existence of general and severe distress had been formerly recognised and the complete machinery of famine-relief had been set in operation. They may be given in any district in which you consider that relief is required and in which they will obviate the necessity for other relief measures. Nor is it imperative on you to remit a portion of the principal of the advance in every case. Cases may occur in which the labour which the grantee employs is thoroughly efficient, and in which therefore the work will not cost more to execute than in ordinary times. It should, however, be a condition of all advances that the persons to whom they are given employ as labourers those who really require work and not merely the most skilful workmen of the village; and it should be a further condition that the advance, or the recoverable portion, should be repaid within a shorter space of time than is allowed by the ordinary rules under the Land Improvement Loans Act. On account of these two conditions it is reasonable that the advances should be made free of interest, and that in the majority of cases a portion of the principal should be remitted.

No. 494 F.—73-2.

Copy of correspondence forwarded to the Finance Department for information.

---

* Land Improvement Loans, 1 lac. Agricultural Loans, 4½ lacs.

Telegram dated the 8th February 1897.

From CHIEF COMMISSIONER, Central Provinces, Nagpur, to REVENUE SECRETARY, Calcutta.

Chief Commissioner finds a general consensus that large advances for seed grain are necessary to provide for sowing of full area in June next in rice districts of Chhattisgarh and Balaghat. It is represented that only local seed will be suitable for sowing, and that, if arrangements are not immediately made, small produce of last harvest will be entirely consumed. Malguzars' stocks are exhausted owing to successive bad harvests and local banias too few and unimportant to be relied on. Chief Commissioner agrees that some action of kind suggested is essential. No funds whatever now available in Provincial Loans Account, and Chief Commissioner therefore asks Government of India to sanction immediate grant of three lakhs for agriculturists' loans in current year. Orders solicited by telegraph.

Telegram No. 672A., dated the 10th February 1897.

From FINANCE SECRETARY, Calcutta, to CHIEF COMMISSIONER, Central Provinces, Nagpur.

Your telegram to Revenue, 8th February. Additional grant three lakhs rupees for agricultural loans is sanctioned.

No. 673A.

Ordered that copy be forwarded to the Revenue and Agricultural Department, to the Comptroller and Auditor General, and to the Comptroller, Central Provinces, for information.

No. 907, dated Nagpur, the 13th February 1897.

From H. H. PRIEST, Esq., I.C.S., CHIEF SECRETARY TO THE CHIEF COMMISSIONER, Central Provinces, to the SECRETARY TO THE GOVERNMENT OF INDIA, DEPARTMENT OF REVENUE AND AGRICULTURE.

1. I am directed to address the Government of India on the subject of the further funds required to meet expenditure on famine relief in these Provinces up to the 31st March next.

2. In paragraph 12 of my letter No. 4988, dated 16th December 1896, it was pointed out that the sum of 15 lakhs of rupees which, it was then thought, might suffice to meet this expenditure could not be regarded as more than a "rough preliminary "estimate of probable requirements," and in paragraphs 9 and 14 of the same letter stress was laid on the difficulty, indeed the impossibility of framing satisfactory forecasts of famine expenditure in a province which had had no previous experience either of general scarcity or of the outlay which a widespread scheme of Famine Relief involves. Events have more than justified Mr. Lyall's doubts as to the possibility of estimating requirements in the absence of actual experience, and it has been evident to him and his advisers for some time past that the sum of 15 lakhs granted in December last would be quite insufficient to support the rapidly increasing numbers seeking Government relief. The Chief Commissioner was, however, unwilling to apply for a further grant until he should be able to state, with some approach to exactness, the probable total expenditure on famine relief up to the end of the current year. This he has only recently been enabled to do.

3. Broadly speaking, an allotment of 15 lakhs for four months, December to April (the amount sanctioned by the Government of India in January last), provides for the relief of an average number of, at most, 125,000 persons per diem. At the time when my former letter was written, the average numbers of persons in receipt of Government relief had not reached half this figure, and the Chief Commissioner anticipated that, while there would no doubt be considerable increase as soon as the scanty autumn crops

had been consumed, the complete organisation of large works under the Public Works Department and the stricter insistence on a full task would deter some of those who were not actually distressed, but who were glad to earn a daily wage in return for very light work, from further recourse to Government relief works. These anticipations were, however, not realised. From the latter part of December numbers, especially in the Jubbulpore Division, where the ranks of those seeking relief were swelled by crowds of needy immigrants from the adjacent Native States, rose very rapidly, and on the 26th December the provincial total stood at 136,000, a figure considerably in excess of the average number originally estimated for. Nor did the increase stop here. By the 9th of January the provincial total reached 200,000; by the 23rd it stood at 246,000; while on the 30th, the latest date for which complete returns are available, the aggregate number relieved was 282,000. Harvest labour, and the supply of food which the mohwa crop will afford, will doubtless cause some diminution in these numbers; but in view of the fact that the bulk of those who are now in distress come from parts of the province chiefly dependent on the outturn of the autumn crops, that the *rabi* area throughout the province has been greatly restricted and will not give the usual amount of harvest labour, and that the recent unsettled weather and rain may greatly injure the prospects of the mohwa crop, the Chief Commissioner does not think it would be safe to estimate for any considerable falling off in numbers before the end of the present financial year.

4. As regards the additional grant which will be necessary, I am to say that the actual expenditure up to the end of January on account of Famine Relief operations under the control of the Public Works Department and Civil Officers, respectively, is stated to be as follows:—

	Rs.
Public Works Department - - - -	6,11,000
Civil Officers - - - - -	4,25,000
Total -	10,36,000

leaving a balance, at the beginning of February, of Rs. 4,64,000 out of the grant of 15 lakhs sanctioned in December last. At the end of January there were some 280,000 persons in receipt of Government relief, and after allowing for such diminution as may be caused by harvest labour, by the check on immigration consequent on a more adequate organisation of Famine Relief in the States of the Baghelkhand and Bundelkhand Agencies, and finally by the opening of the forests, we could not, Mr. Lyall thinks, safely estimate for a lower daily average than 240,000. Taking one rupee as sufficient to relieve eight persons with the necessary margin for the heavy incidental charges on establishments, tools, and plant, hutting, &c., and contingencies, this gives an expenditure, to the end of March, of Rs. 18,00,000. Deducting from this the Rs. 4,64,000 which are still in hand, the amount necessary to cover expenditure during the remainder of the current year is Rs. 13,36,000, or say 13½ lakhs.

5. The Chief Commissioner would accordingly ask the Government of India to sanction this additional grant (*viz.* 13½ lakhs of rupees) for the purposes of Famine Relief up to the end of the current financial year.

Telegram No. 845A., dated the 19th February 1897.

From FINANCE SECRETARY, Calcutta, to CHIEF COMMISSIONER, Central Provinces, Nagpur.

Your letter to Revenue, No. 907 of the 13th February. Further grant thirteen-and-a-half lakhs rupees sanctioned for famine expenditure this year.

No. 846A.

Ordered that copy be forwarded to the Revenue and Agricultural Department.

Ordered also that copy be forwarded to the Comptroller and Auditor General and to the Comptroller, Central Provinces, in continuation of No. 210A., dated the 15th January 1897.

No. 848, dated Nagpur, the 11th February 1897.

From H. H. PRIEST, Esq., I.C.S., Chief Secretary to the Chief Commissioner, Central Provinces, to the SECRETARY TO THE GOVERNMENT OF INDIA.

In continuation of my letter No. 100c, dated the 15th January 1897, I am directed to submit, for the information of the Government of India, consolidated monthly Famine Statements A. and B. for the distressed districts of the Nagpur, Nerbudda, and Chhattisgarh Divisions. In the case of the Nagpur and Chhattisgarh Divisions, a copy of the Deputy Commissioner's remarks to accompany Statement A. is submitted in each case, while for the districts of the Nerbudda Division, a summary, by the Commissioner, of the district Reports is appended. Maps of each district, coloured to show the affected areas, are also forwarded.

2. The delay in submitting these Reports, which the Chief Commissioner greatly regrets, is due to the district officers concerned having had no previous experience of famine work. Full instructions for the preparation of these Reports (copy of which I am to attach) were issued in January, and it is believed that they will be submitted punctually and in accurate and complete form in future.

3. I am to add that a detailed report on the famine situation in these Provinces is being separately submitted for the information of the Government of India.

Monthly Famine Statement A. for the Four Weeks ending Saturday Evening, the 26th December 1896.

MEMORANDUM to accompany MONTHLY FAMINE STATEMENT A. for the month of December 1896.

NAGPUR.

Private Relief.—There has been no regularly organised private relief. Some of the wealthy and leading native gentlemen residing in the Nagpur City, as well as those residing in the other large towns in the district, are in the habit of relieving distress at their doors daily, either in coin, grain, or cooked food. Besides this, they have subscribed towards a general famine fund, which goes to maintain the poor-houses opened at Nagpur and Kamptee.

Poor-house Relief.—Poor-houses were opened out at Kamptee and Nagpur in October and November respectively, at which, on an average, 448 men, 512 women, and 828 children were relieved daily during the month of December. The total sum spent on this description of relief since the poor-houses were established amounts to Rs. 5,000, the funds being provided by private subscriptions. Nothing was spent on this account from the famine grant.

Village Relief.—The circumstances of the district are such that it has not yet been found necessary to introduce the system of village-to-village relief.

General Character of Relief Works.—During the month under report relief works were started at Borgaon, Bagadganj, Nagpur City, Madhoba, Dighori, and Umrer. The city works consisted of earthworks in connexion with the improvement of the southern boulevard road and the filling in of hollows in circles 22 and 24. The other works consisted of stone-breaking for metalled roads.

All these works provided occupation for about 4,300 people daily and entailed an expenditure of about Rs. 11,000, including cost of tools, hutting, &c.

Besides the above, the Empress Mills Company has and continues to afford occupation to a large number of people in Nagpur, in connexion with the work of levelling the high ground to the north of the Jama tank.

The adjustment of the rates of wages at the different work camps was made in accordance with the rules laid down in Chapter VII. of the Famine Code.

Physical Condition of the People.—On the whole, the physical condition of the people employed on relief works and in the district generally may be regarded as fair. The district is at present free from any epidemic disease.

Deaths from Starvation.—During the month 32 deaths are reported by the police to have been due to, or accelerated by, privation. All these cases occurred on the main roads from Seoni to Nagpur, Bhandara to Nagpur, and Amraoti to Nagpur. The deceased were mostly foreigners travelling by these roads.

Food-stocks.—Sufficient.

Importation of Grain.—Fifty-seven thousand nine hundred and one maunds of food-grains were imported into the city of Nagpur during the month of December. Reliable statistics in respect to the other towns in the district are not available.

General Condition and Prospects of Affected Area.—The most distressed portions of the district are the Dongarthal and Bheogarh parganas, to the north in the Ramtek tahsil, the Khondhali tract, in the Katol tahsil, and the vicinity of Bazargaon, in the Nagpur tahsil. In none of these, however, can distress be described as severe or acute. For the Khondhali and Bazargaon tracts, where it is hoped that the people will have no difficulty in obtaining field work during the next two or three months, free access to the Government forests for edible produce, dry wood, &c., &c., is all that is required at present, and this is being arranged for in communication with the Conservator of Forests, Southern Circle.

Relief work will also very shortly be started for the people in the north of the district, on the Khapa-Patansaongi road. The necessity for this in that direction is the result of there being less *rabi* cultivation in the north than in other parts of the district.

In regard to the Umrer tahsil, where at one time it was apprehended that distress would be worse than in other parts of the district, the rain which fell about the 21st November has done so much good that prospects are quite changed and materially improved. Liberal distribution of takavi is all that is required here at present, for which due arrangements are being made personally by the Deputy Commissioner, assisted by an Extra-Assistant Commissioner.

Were it not for the lamentably large number of weavers out of work in large towns like Nagpur and Kamptee and places like Umrer and Khapa, there would be little necessity for relief works at present in any part of the district.

The prospects of the *rabi* crops have slightly improved by the rain which fell towards the close of December and the beginning of January.

Changes in Rates of Wages.—There has been a very slight falling off in the rate of wages, due to the prevailing high prices.

Other Matters, e.g., *State of Crime.*—No dacoities nor robberies have been registered, and there is no organised professional crime. The increase under burglaries is 48 and that under thefts, ordinary, 66. The increases are due to the prevailing scarcity; eight out of 11 circles show an increase under burglaries and eight under thefts. The increase is confined for the most part to petty cases. No very heavy burglaries or thefts have been registered over 50 in value; only one theft was reported, whereas last year there were three such cases. In spite of the scarcity it is surprising to find how free the district has been of any heinous crime.

The largest increase has occurred in the Nagpur City. The figures for December last year and December this year for the city are compared below :—

	1895.	1896.
Burglaries - - - - -	6	25
Thefts, ordinary - - - - -	7	20

Taking the district as a whole, the increase of crime is not very large.

BHANDARA.

Private Relief.—Miscellaneous charity by private persons has been discouraged, as most persons of position are subscribers to one or other of the poor-houses established in the district. A few cases of pardanashin women requiring relief in their own homes have been brought to notice, and have been relieved from poor-house funds.

Poor-house Relief.—There are now four poor-houses in the district; the cost of dieting the inmates is met entirely from private subscription. Clothing, medicines, and other necessaries are the only things hitherto supplied at Government expense. The poor-houses are in charge of hospital assistants. The number of inmates does not show any considerable increase; it was 273 on the 5th December 1896, and only rose to 386 by the end of the month. Out of these, the Gondia poor-house is responsible for 209. A large proportion of the inmates there are residents of Balaghat. Their physical condition is decidedly worse than that of the residents of this district.

Village Relief.—The question of the necessity of village relief has been discussed in recent correspondence. No extensive measures appear necessary at present. Arrangements have been made to ensure that all persons in need of relief are sent to the nearest poor-house or relief work, as the case may be. For the relief of children who are neglected by their parents, kitchens under police supervision are being started as an experimental measure.

General Character of Relief Works.—Earthwork, excavation of murrum, and stone-breaking is in progress on all works at Tumsar for the metalling of the Rampaili Road, and at Phulchour and Arjuni for the construction of a new class I. road to connect these places. Work was executed under the orders of the Public Works Department.

Physical Condition of the People.—During the month I inspected all the works and also toured through a considerable portion of the district. The physical condition of the labourers on the works is by no means bad, except in isolated cases. Most of these prove on inquiry to be residents of Balaghat who had wandered to Nagpur or the Berars in search of work months ago and were returning unsuccessful when they found this way to the relief works in this district. In the whole area returned as non-affected the condition of the people is fairly normal, although isolated cases of distress may occur.

Deaths from Starvation.—Twenty-one deaths have been reported from the Gondia poor-house during November; they occurred almost entirely at the beginning of the month, when the poor-house was newly started, among wanderers in the last state of emaciation. A few cases have probably occurred in other parts of the district, but

as they were not then separately reported, they have probably been included among deaths from other causes.

Food-stocks.—Generally speaking, food-stocks are sufficient throughout the district.

Importation of Grain.—Three thousand three hundred and fifty-seven maunds of rice and 1,244 maunds of wheat are reported to have been imported into Bhandara and Pouni during the month; much of it from Raipur and Chanda. On the other hand, 1,985 maunds of rice and 1,370 of wheat are said to have been exported mostly from Tumsar. No information is at present available regarding Tirrora, Gondia, and other centres of trade; considerable importations of the common kinds of rice take place every year, the better kinds of rice which are grown in Bhandara being exported in exchange.

General Condition and Prospects of the Affected Area.—Real famine can hardly be said to exist anywhere. There is acute distress over about 500 square miles of the district, and more or less scarcity over 1,200 square miles or so, but the remaining 2,200 square miles are in a fairly normal condition.

The November rain has materially improved the prospects of the *rabi* crop in the affected area, but the recent cloudy weather is reported to have caused some damage.

Rate of Wages.—Wages have been paid according to the Famine Code on a basis of 10 seers per rupee, the current price of rice. The price of rice has now fallen to 11 seers at head-quarters, but still remains at 10 seers on the works.

Balaghat.

Private Relief.—Pardanashin women requiring relief in their own homes have been relieved from poor-house funds. The zamindar of Kulpa is supporting all the destitute Mahomedan women and children resident at Baila.

Poor-house Relief.—There were three poor-houses during the month at Balaghat, Katangi, and Baihar. The cost of dieting was met entirely from private subscriptions at all the poor-houses; clothing, medicines, and other necessaries being supplied at Government expense at Balaghat and Baihar. At Katangi there was no expenditure from Government funds. The Balaghat poor-house is in charge of the head clerk, district office, the Baihar poor-house in that of the tahsildar, and that at Katangi in that of the hospital assistant. The monthly subscriptions at Balaghat amount to Rs. 400 and at Katangi Rs. 110. The exact amount of the Baihar subscription is not known, but I presume they aggregate Rs. 50. The expenditure for December was as follows:—

	Rs.	a.	p.
Balaghat from private funds - - -	322	4	0
„ „ Government funds - - -	200	0	0
Baihar from private funds - - -	46	9	0
„ „ Government funds - - -	70	0	0
Katangi from private funds - - -	110	7	6

The number of inmates rose from 488 to 558.

Village Relief.—The physical condition of the inmates is very low. No village centres were established during the month. It is impracticable to establish any in the Baihar tahsil, but in the Balaghat tahsil three have been established since at Hatta, Kirnapur, and Baila, and one will shortly be established at Lalbarra. Advances have been sent to all police stations and outposts and to each revenue inspector for the purpose of forwarding starving wanderers to the nearest poor-house or famine relief work. Section 34 of the Famine Code has been made applicable.

General Character of Relief Works.—Earthwork and excavation of murrum was in progress on all works. The works in progress during the month were the first and third sections of the Balaghat-Baihar road, the Lalbarra-Rampaili and Lanji-Amgaon roads, the tanks at Baihar and Bansuli, and repairs to the Nazul roads at Balaghat. Work on the first three roads was executed under the orders of the Public Works Department and on the last three under the orders of the district authority.

Physical Condition of the People.—The physical condition of the labourers on the works was fair. In the non-affected area their condition is normal. It is very bad in the Baihar tahsil.

Deaths from Starvation.—One hundred and twenty deaths have been reported by the police. The civil surgeon opines a much higher death-rate, but I do not believe this. There are a large number of persons whose physical condition has become low owing to

insufficient food, and they contract fever and other diseases which they might have escaped had they been nourished, and easily succumb to them. A large number of the deaths reported under this head are of this kind.

Food-stock.—Sufficient for the present; reserve stocks are, however, very scanty and will soon be exhausted.

Importation of Grain.—No statistics are available, but common kinds of rice are being brought in from the Sambalpur District.

General Condition and Prospects of the Affected Area.—The condition of the people is causing anxiety. The *kharif* crops have failed entirely, the outturn of the most important crop (rice) being only 3 annas on the average. The area under *rabi* has declined considerably. The November rain has benefited *rabi* crops, but the subsequent cloudy weather has done some damage to those in flower. A four-anna outturn is expected; Rs. 80,000 have been loaned out up to date under the Land Improvement Act, and about 4,000 people are supported by the tank works in progress.

Rate of Wages.—These have been paid according to the Famine Code on a basis of 10 seers per rupee. The price of rice has risen to 8 seers per rupee in the Baihar tahsil, and wages will be raised accordingly.

Nerbudda Division.

Private Relief.—Private relief took the form of funds raised in the chief towns of Hoshangabad, Narsinghpur, Gadurwara, Burhanpur, Betul, Chhota Chhindwara, and also at Pachmarhi, from public subscriptions and applied to the feeding of infirm persons and children (residents of the towns) under the supervision of private committees. No details have been furnished as to the amounts expended from these funds during December or the number of persons relieved, except in the case of Chhota Chhindwara (in the Narsinghpur District) where the outlay was Rs. 112 and the number fed (on the last day of the month) 192.

Government poor-houses were opened at Hoshangabad, Sohagpur, Narsinghpur Gadurwara, Badnur, and Chhindwara. The number of inmates on the 26th December 1896 was 1,630.*

There were private poor-houses at Betul and at Amarwara in the Chhindwara District, the latter being a missionary institution.

Village Relief.—Village relief was in process of organisation; the village registers were partly written up in the Narsinghpur, Hoshangabad, and Betul Districts.

Relief Works.—There were the following relief works open—all of them roads:—

District.	Work.	Date of Opening.	Number of Workers on 26th December 1896.
Hoshangabad	(1) Piparia-Saudia Road	27th November 1896	
	(2) Piparia-Sobhapur Road	„ „ „	
	(3) Piparia-Matkuli „	3rd December „	20,471
	(4) Bagra Babai „	„ „ „	
	(5) Itarsi-Dhar „	7th „ „	
Narsinghpur	(1) Gadurwara-Sanikhera Road	30th November „	
	(2) Narsinghpur-Sankal „	2nd December „	
	(3) Narsinghpur-Lakhnadon Road	„ „ „	6,016
	(4) Saugor-Kareli Road	„ „ „	
	(5) Birmhan-Tendukhera Road	„ „ „	
Chhindwara	(1) Chhindwara-Matkuli „	16th „ „	1,261
	(2) Chhindwara-Narsinghpur Road	„ „ „	
Betul	(1) Badnur-Dhar Road	7th „ „	884
Nimar	(1) Burhanpur-Lalbagh Road	8th „ „	325
			28,957

	Poor-house Relief.
*Narsinghpur	524
Gadurwara	458
Hoshangabad	317
Sohagpur	159
Chhindwara	98
Badnur	74
	1,630

In all 14 road-works employing 28,957 persons. Besides these, there were two test works, also roads in the Betul District,* and one in the Harsud tahsil of the Nimar District.

There were no village works carried out either directly by Government or with the aid of Government loans.

Physical Condition of the People.—On relief works the general condition of the workers was distinctly good. On the other hand, the persons admitted to poor-houses, consisting mostly of professional beggars or starving wanderers, were as a rule in an emaciated state. On one work, the Itarsi, Dhar road (at Bagdeo) the workers were considerably below the average in physical condition, the explanation given being that the Kesla tract through which the road runs had suffered worse than other parts of the district from the failure of kharif crops.

Deaths from Starvation.—The district reports give the following figures:—

Hoshangabad	No returns.
Narsinghpur	1,859
Betul	11
Nimar	22
Chhindwara	No returns.
	1,892

The Narsinghpur figures are, it is probable, based on a mistaken understanding of what deaths are to be shown as due to starvation. Careful inquiry is being made regarding them.

These returns are thus not wholly reliable; when the cause of death is not clear the disposition is to attribute it to starvation. But there can be no doubt that many wanderers from remote districts, provinces, and foreign states have died from want and exhaustion. Strict orders were issued to the Police to succour and forward to poor-houses and relief centres at relief works travellers who are in an exhausted state and have no means of supporting themselves.

Food-stocks.—Food-stocks are reported to be sufficient, except that in the Betul District the supply of jowari is short and is being supplemented by imports, chiefly from Berar.

Importation of Grain.—Besides the importations from Berar into Betul there were considerable imports of grain into the Nimar District. This district, however, annually imports grain.

General Condition and Prospects.—Rabi prospects are not promising, except in the Chhindwara District. It is unnecessary to give here the probable outturn of wheat and gram, as later estimates are by now available.

Changes in Rate of Wages.—Prices fell slightly in Hoshangabad and rose in Betul. In Hoshangabad the wage rate was calculated on 10½ seers to the rupee (instead of 10 seers as at the beginning of the month) and in Betul on 9 seers (instead of 11). But in the case of Betul this was only a temporary rise, the rate being reduced to 10 seers early in January.

Other Matters.—There was an increase in crime (mostly petty thefts) caused by the pressure of want, but not to a very large extent.

Raipur.

1. *Private Relief.*—Arrangements have been made for starting local works by mulguzars, many of whom have been given taccavi advances for the purpose. These are being organised. Particulars as to the number of persons on such relief works, &c., are not available now; they will be given in the next month's report.

2. *Poor-house Relief.*—Five poor-houses, viz., at Raipur, Arang, Simga, Baloda, and Dhamda, have been started by private charity. As it is desirable that private charity should been encouraged and developed in the earlier stages of distress, these poor-houses have not yet been taken over by Government. They will be subsidized by Government grants or entirely supported by Government as necessity arises.

3. *Village Relief.*—The registers prescribed under section 34 of the Famine Code have been prepared for most of the Revenue Inspectors' circles, and others are in

* Chicholi-Nimpani Road - 454
Shahpur-Ranipur - 499
953

progress. Local officers deputed on famine works, including police, have been provided with funds for affording gratuitous relief to those who may be found in real need of it. Time for such expenditure on a large scale has not yet arrived. The matter is receiving careful consideration.

4. *General Character of Relief Works.*—The relief works started till now are—

(1.) Simga-Kawardha road.
(2.) Jilda-Sirpur road.
(3.) Dhamda-Deorbija road.

These are being carried out by Public Works Department, the relief workers being chiefly employed in earthwork. Sanction has been obtained for starting a fourth road from Drug to Gunderdehi, and the Chief Engineer has been requested to take necessary action.

5. *Physical Condition of People.*—Mr. P. C. Lall, assistant engineer in immediate charge of the relief works, reports that most of the people who come to the works are in "bad condition"; on a later inspection by the Chief Engineer, that officer considered the appearance of the workers to be quite normal.

6. *Deaths, if any, from Starvation.*—No deaths from starvation or from its effects among the gangs at work on the relief works. Vague reports of such deaths in the interior are now and then received from Revenue Inspectors and others, but such reports require confirmation, and Tahsildars have been directed to inquire into their accuracy.

7. *Food-stocks.*—Food-stocks sufficient, but prices being comparatively high, pressure is being felt by the poorer classes.

8. *Importation of Grain.*—In ordinary times, large quantities of grain are *exported* from this district, but on account of the agricultural depression, there has been little of export of late, and scarcely any appreciable quantity imported. The necessity for importing food-stock, to supplement the food resources of the district, has not yet arisen.

9. *General Condition and Prospects of Affected Area.*—Till the rabi crops are harvested the condition of the affected area, where the rice crop has more or less failed, must be a matter of anxiety, but the measures already taken and the vigilant watch which is being kept are calculated to ameliorate it. The rainfall of the 22nd and 23rd November last has improved the prospects of the rabi crops to a great extent and partly allayed the serious anxiety previously felt. The rabi crops which had been sown, but had not germinated, have come up, and a considerable area formerly left unsown has been sown since with gram, batra, and masoor. The prospects of these crops are as yet hopeful, but the area sown is much below the normal.

10. *Changes in Rate of Wages.*—As prices of food-grain, though high, are steady, it has not been found necessary to change the rates of wages.

11. *Other Matters, Railway, &c.*—The Bengal-Nagpur Railway Company has not yet been able to commence the construction of the proposed feeder line from Raipur to Dhamtari. Crime of the nature of petty thefts is on the increase.

Bilaspur.

There were four poor-houses maintained from private charity open at the close of the period, viz.:—

(*a.*) At Bilaspur, maintained partly by private subscriptions and partly by the Municipal Committee with a grant-in-aid of Rs. 200 from the Rs. 500 sanctioned by Chief Commissioner in his No. 501 C., dated 3rd November 1896. One hundred and seventy-seven persons were relieved on the 26th December.

(*b.*) At Mungeli, maintained entirely from private subscriptions. This institution, first opened in October, was closed for some days in December, pending the erection of proper buildings; 160 persons were relieved on 26th December.

(*c.*) At Pandaria, from estate funds. The number of inmates on the 26th December has not yet been given, but has been asked for.

(*d.*) At Bhatpara, from private subscriptions. Number relieved on 26th December was 55.

The amount raised by private charity is not precisely known. It will be given next month. Poor-houses were in charge of—

(*a.*) Mr. Ghose, Extra Assistant Commissioner.
(*b.*) Tahsildar, Mungeli.

(*c.*) Manager of the estate.
(*d.*) A local Committee, with assistance of the Head Constable.

2. There were no Government poor-houses.

3. There are no relief centres, and no persons were relieved in their homes.

4. No relief works were open by Government. The Pandaria Estate had a relief work open on which 184 persons were at work on the 26th December.

5.—(*a.*) The physical condition of persons in the poor-houses was generally poor, none but those in poor condition being as a rule admitted. Many, however, were professional beggars, lepers, blind persons, cripples, and such like.

(*b.*) I saw the Pandaria work on the 26th December and was struck by the good condition of all at work on it.

(*c.*) Emaciated persons, especially among the children, are to be found in most large villages in north and west of Mungeli, including Pandaria, but they are not numerous.

6. The reports from the police are not received regularly. Such deaths, however, have been reported, chiefly from the north and west of Mungeli. Figures will be supplied shortly.

7. Food-stocks appear sufficient.

8. Station-masters have been asked to supply figures showing importation of grain. Returns were received for weeks ending 5th, 12th, and 19th December, giving total import 672 maunds, while exports for same period amounted to 39,174 maunds. No return was received for the week ending 26th December. Supposing imports and exports to have continued at the same rate, the total would amount to 896 maunds, and exports to 52,232 for the four weeks. Roughly, two-thirds of the exports are to stations outside the Central Provinces and one-third to stations within the Central Provinces.

9. The entire district has been shown as affected, because, while the parts badly affected are comparatively small (north and west of Mungeli, including Pandaria, extreme north and extreme south of Bilaspur), villages or groups of villages occur in other parts which are depressed and may require special measures as regards the kist. For purposes of relief it is believed that they will be sufficiently provided for by village works carried on from Takkavi advances.

10. Wages at Pandaria are paid on a food rate of 10 seers per rupee.

11. The state of crime is illustrated by the following table :—

	Last Month.	Previous Month.	Corresponding Month last Year.
Thefts	134	154	67
Cattle thefts (*a*)	35	25	12
Housebreaking	66	53	44

(*a*) Includes mischief to cattle. The figures are for December and are "Offences reported."

No. 975, dated 17th February 1897.

From H. H. PRIEST, Esq., I.C.S., Chief Secretary to the Chief Commissioner, Central Provinces, to THE SECRETARY TO THE GOVERNMENT OF INDIA, Department of Revenue and Agriculture.

I am directed to submit, for the information of the Government of India, consolidated Monthy Famine Statements A. and B., as prescribed by section 16, IV.-VII. of the Central Provinces Famine Code, for the month of January for all districts of the Central Provinces which are affected by scarcity, except Hoshangabad and Narsinghpur, the reports for which will be submitted as soon as they are received. A memorandum by the Commissioners of the Divisions summarising the main facts of the situation in the affected districts is also forwarded for each division, as well as copies of letters from the Commissioners, Nagpur and Nerbudda Divisions, forwarding these memoranda. Maps coloured to show the affected areas accompany the statements in the case of all districts, except Damoh and Balaghat. There has been no change in the affected area in these districts since the last monthly report was submitted.

2. As the Chief Commissioner has recently (*vide* No. 849, dated the 12th instant) submitted to the Government of India a comprehensive report on the famine situation in these Provinces, he considers it unnecessary to add anything to the remarks made by his Commissioners.

Monthly Famine Statement A. for the Five Weeks ending Saturday Evening, the 30th January 1897.

SUMMARY of the REMARKS in the DISTRICT REPORTS to accompany MONTHLY FAMINE STATEMENTS A. and B. (JUBBULPORE DIVISION) for January 1897.

1. *Private Relief.*—In the city of Jubbulpore the committee of inquiry appointed at the public meeting referred to in my summary for December, submitted its report, which showed that there were about 200 persons of the repectable classes who needed relief, though ashamed to make their want known. The committee was authorised to collect the subscriptions previously promised and distribute them. A sum of Rs. 575 was collected, and about Rs. 200 was distributed in this form of relief. Some members of the Theosophical Society in Jubbulpore have formed a separate committee of their own, and have raised subscriptions (amount unknown), which are devoted to feeding beggars, and to the rendering of relief to poor families by selling them grain below the market rates. In the Saugor district about Rs. 2,800 have been raised from subscriptions, and will be spent in accordance with the general scheme of private relief to be adopted throughout India, on the lines laid down at the public meeting at which his Excellency the Viceroy presided at Calcutta. These lines will be followed in all other districts in due course, on the formation of the Provincial Committee for the Central Provinces and of the local committees for the distressed areas. In Mandla a charitable fund, called the "Lyall Reception Fund," was raised, on the occasion of the Chief Commissioner's recent visit to that district, and the amount subscribed is Rs. 3,200. About Rs. 800 of this has been spent in providing blankets for the inmates of the poor-houses. In Seoni a sum of Rs. 3,200 has been subscribed during the past few months, of which Rs. 1,200 has been spent on a poor-house. This institution is now maintained by Government, and the balance of the subscriptions will be devoted to the recognised objects of private charity. For the rest, the information under this head is necessarily indefinite, as no precise statement can be made as to the extent to which doles are distributed to beggars by the charitably disposed at their own doors, a form of indiscriminate relief which specially appeals to the native mind.

2. *Poor-house Relief.*—The following is a comparative statement of the number of poor-houses in the division, and of their inmates, at the end of December and the end of January respectively :—

District.	No. of Poor-houses.		No. of Inmates.	
	26th December.	30th January.	26th December.	30th January.
Jubbulpore	4	5	3,309	*4,341
Saugor	4	5	1,898	3,182
Damoh	4	4	753	1,516
Mandla	2	2	169	290
Seoni	2	2	264	546
Total	16	18	6,393	9,875

* Exclusive of about 350 persons in the mission poor-houses at Jubbulpore at Murwara.

A new poorhouse was opened at Umaria, Khalwar (the colliery), in Jubbulpore, and at Shahgarh, in Saugor. A large proportion of the inmates of the poorhouses in the Jubbulpore and Damoh districts come from the native states of Baghelkhand and Bundelkhand.

3. *Village Relief.*—(*a.*) *Relief Centres.*—The following is a statement of the number of relief centres open at the close of January, with details of the relief afforded :—

District.	Number of Centres.	Number of Persons.	
		Relieved gratuitously.	Employed on Work at the Centres.
Jubbulpore	15	3,286	30,353
Saugor	8	897	137
Damoh	4	Not stated.	—
Mandla	17	117	2,966
Seoni	7	251	2,222
Total	51	4,551	35,678

In Jubbulpore new centres were opened at Sleemanabad and Panagarh on the Jubbulpore-Mirzapur road, along which so many wanderers pass; in Mandla, at two places in a remote part of the Dindori Tahsil (in accordance with the Deputy Commissioner's original plan of operations); and in Seoni, at Chappara, on the Great Northern road, which is much frequented by travellers.

In Jubbulpore there has been a rush on the relief centres of applicants for work, especially in the northern portion of the district adjoining the Native States, which have contributed in no little degree to the rush. This has necessitated a revision and enlargement of the programme of the Public Works Department works in this district, the professed object of the relief centre being to provide light labour for those only from whom a regular task cannot be expected, all the able-bodied being drafted to a regular relief work. In Damoh, relief centres have been combined with local works carried on under the Deputy Commissioner's orders, chiefly in parts of the district which are distant from the Public Works Department relief works. A large number of relief centres is suited to the mountainous and jungly character of the Mandla district with its large aboriginal population.

(*b.*) *Relief of the People in their Homes.*—The greatest progress has been made under this head in the Saugor district, where the number so relieved at the close of the month was 6,656. In Jubbulpore the latest number returned is 1,468, but the Deputy Commissioner explains that this figure falls short of the reality as the accounts of the sums distributed have not yet been rendered, although distribution is being made in all Revenue Inspectors' circles. The total number of registered poor in the Jubbulpore district is 7,811, the population being 748,146. In Damoh the registers of poor which had been prepared were found to be defective and had to be revised, entailing delay in introducing house to house relief. In his report for the week ending 23rd January, the Deputy Commissioner writes:—

"The faulty compilation of the first list seems to have been largely due to a rumour " which seems to have gained general credence that the Government was preparing these " lists in order to transport all the persons whose names should be entered." He now writes that the necessary advances have been made to all the Revenue Inspectors, and that the scheme will be brought into full force during the current month. Both in Mandla and Seoni, the scheme has only quite recently been brought into operation, and figures showing the number relieved are not at present available. The working of the system is much the same in all districts. Advances are made to the Revenue Inspectors who distribute the necessary sums to the Patwaris (each for his own circle) for payment to the recipients by the Mukaddam. The Mukaddam has a list of the registered recipients of his village, and the obligation of seeing that they are actually relieved and fed rests with him. He has also to report the death of any of those on the list, to which no additions can be made except they are reported to and approved by the Revenue Inspector. The Revenue Inspectors are supervised by Tahsildars or other superior officers deputed to famine duty.

4. *General Character of Relief Works*—(*a.*) *Public Works Department Relief Works.*—The chief relief works are conducted by the Public Works Department and are all road works, either road construction or more usually the collection and breaking of metal for existing roads. The numbers on such works at the end of December and January respectively in each district are shown below:—

District.	26th December.	30th January.	——
Jubbulpore - - - - -	10,050	(1)* 31,466	(1) 5,739
Saugor - - - - -	18,352	(2) 26,508	(2) 2,286
Damoh - - - - -	1,530	(3) 7,791	(3) 427
Mandla - - - - -	3,324	(4) 13,017	(4) 793
Seoni - - - - -	4,667	(5) 3,686	(5) 382
Total - -	37,923	82,468	9,627

* Includes dependants.

In the Jubbulpore district, new work was opened during January on the Umaria-Khamtara road and on the Mirzapur road near Sleemanabad. In Saugor the number of "charges" remain unaltered. In Damoh two new "charges" were started on the

Jubbulpore-Damoh road, one near Damoh and the other near Jabera. In Mandla work was freshly opened on the Mandla-Dindori road. In Seoni two works were in progress both months.

(*b.*) *Local Works under the District Officer.*—The following were the numbers employed at the close of the month in each district. The figures are taken from a compiled statement prepared in my office from the weekly famine reports :—

Jubbulpore - - - - -	28,683
Saugor - - - - -	425
Damoh - - - - -	11,559
Mandla - - - - -	1,004
Seoni - - - - -	838
Total - -	42,509

Most of those in Jubbulpore are employed on tank work started by the Deputy Commissioner in the Murwara Tahsil in order to relieve the pressure at the relief centres. The figures for this district also include 7,600 persons employed in the Jubbulpore municipality. Under the head "Relief centres," I have already referred to the local works in Damoh, they are all tanks. The question of moving able-bodied persons from these works to the Public Works Department relief works has been the subject of correspondence between the Deputy Commissioner and myself. I hope to visit the Damoh district shortly, and shall then be in a better position to advise the Deputy Commissioner in the matter.

(*c.*) *Famine Loan Works.*—An allotment has been made to this division of Rs. 1,20,000, which has been distributed to the several districts, but no works under this head have been yet begun.

5. *Physical Condition of the People.*—Extreme emaciation appears to be generally confined to the inmates of the poor-houses, and to those relieved gratuitously at the relief centres. I have already stated that many of the inmates of the poor-houses belong to Native States. The Deputy Commissioner of Saugor says in this connexion :—

"My own observation also goes to show that the bulk of the emaciated persons to be found in the poor-houses are residents of places outside the district, chiefly Native States."

Most of those on light work at relief centres are in weak and reduced condition. The condition of the great majority of these on the regular relief works is "fair" to "good" or remarkably good. Of the people generally in the distressed tracts the Deputy Commissioner of Jubbulpore writes :—

"Such of the population as remains in the villages is generally, I think, with the exception of those on village relief, in fairly good condition. But there are few villages where signs of distress are not apparent. Few ornaments are seen, decent clothes are the exception, and the children are generally underfed.

The Deputy Commissioner of Saugor says :—

"The relief works have now absorbed nearly all the persons resident in distressed tracts who were in need of relief, and the instances of emaciation even in the distressed tracts are now rare."

The Deputy Commissioner of Damoh says :—

"I have noticed many cases of emaciation while camping in the north-east of the district, and think some more local relief works are required."

The Deputy Commissioner of Mandla says :—

"The condition of the people in the distressed tracts is not very bad, and cases of emaciation are not very frequently come across."

The Deputy Commissioner of Seoni says :—

"In the distressed tracts in Barghat, Ugli, and Korai the condition of the people is very fair. Mr. Higgins (on famine duty) reports the same of Gunsore. Emaciation is, in my experience, the exception rather than the rule."

6. *Mortality, Deaths from Starvation, &c.*—The mortality figures for the month of December are reported as follows:—

District.	No. of Deaths.	Death Rate per Mille per Annum.	
		Exclusive of Towns.	Inclusive of Towns.
Jubbulpore	3,743	47·64	60·00
Saugor	3,315	57·74	67·15
Damoh	1,903	—	70·12
Mandla	1,353	—	47·88
Seoni	—	—	56·0

There was no epidemic of cholera or small-pox in any district compared with November, the death rate has fallen in the three first-named districts and risen in the two last.

The detailed statement of deaths reported to be due to starvation, which* I called on Deputy Commissioners to submit with their monthly Famine Report has not been received from any district. Deputy Commissioners will be requested to submit it as soon as possible.

The following is a statement of the deaths reported to be directly or indirectly due to the famine:—

District.	Due to Starvation.	Accelerated by Privation.	Total.
Jubbulpore	Not distinguished.	—	2,052
Saugor	Nil.	Not stated.	Incomplete.
Damoh	11	156	167
Mandla	102	—	102
Seoni	Not distinguished.	Not distinguished.	121

The following is the distribution of the 2,052 deaths reported by the police in Jubbulpore as directly or indirectly due to the famine:—

Residents of the Station House Circle	383
Wanderers	321
Died in poor-houses	1,147
Died on relief works	201
Total	2,052

The number is greatly in excess of the number reported in this district for December, and the Deputy Commissioner attributes the increase partly to the fact that the registration of deaths is more complete now that there are centres of relief to which the destitute come—often in condition beyond remedy—and partly to the increased immigration of starving persons from the Native States. Most of the mortality in the Murwara poor-house, he says, was among foreigners, and much of it in the Jubbulpore poor-house also. I may mention that out of 127 deaths which occurred in the Murwara poor-house in one exceptionally fatal week, 90 were of persons who came from Native States, 20 persons from the North-Western Provinces, one of a wanderer from the Damoh district, and 16 of persons belonging to the Jubbulpore district.

The Saugor district shows a clean sheet, the number of deaths in the poor-houses are not reported. These deaths may (at least in the majority of cases) be said to be indirectly due to famine, and the Deputy Commissioner will be directed to report them in future.

The Deputy Commissioners of Damoh and Mandla think the figures for their districts unreliable, the former being apparently of opinion that more than 11 deaths were due to starvation, while the latter doubts if more than 10 deaths would be found on proper inquiry to be due to actual starvation, or more than 30 to have been accelerated by privation.

* This Office No. C. 35, dated 22nd January 1897, Circulated with Revenue Secretariat Circular Letter, No. 626 of 4th February 1897.

Of the 121 deaths in Seoni, six were cases of persons dying while being conveyed to a place of relief, and the remainder were found dead in empty houses or on the public roads, most of them evidently being wanderers.

7. *Food Stocks.*—Food stocks are low, especially so (it is believed) in the Mandla district, but they will be replenished by the approaching *rabi* harvest, except perhaps at a later stage of the famine in Mandla, there is no reason to suppose that private enterprise will not be equal to the occasion.

The following is a statement of the retail prices of the chief staples at the head-quarters of each district at the end of the months of December and January respectively :—

District.	Wheat.		Gram.		Common Rice.		Remarks.
	December.	January.	December.	January.	December.	January.	
Jubbulpore - -	9¼	9	11	11	10½	9½	
Saugor - -	7	8	9¾	10	6	6½	
Damoh - - -	8	8	11	10	8	8	
Mandla - -	9½	9	10½	10	9	8	
Seoni - - -	10½	10	*12	11¼	10¼	9½	* Price of jowar.

In Saugor prices have fallen slightly ; in Mandla and Damoh there has been a slight rise.

8. *Importation of Grain.*—The imports of grain into the towns of Jubbulpore, Sehora, and Murwara during the month are reported to be 128,390 maunds. The weekly reports show that rice is the chief import ; there is some export to the bordering Native States and to Damoh, but imports largely exceed exports. In Saugor, on the other hand, exports (to Agra, Jhansi, &c.) exceed the imports. Imports into Mandla are said to have been only 302 maunds, chiefly from Jubbulpore.

9. *General Condition and Prospects of Affected Areas.*—In Jubbulpore it is estimated that about two-thirds of the normal *rabi* area has been sown, of which seven-eighths germinated. The standing crop is in good condition and has been benefited by the recent rain. In some localities serious, though not extensive, damage has been caused by hail. In Saugor the Deputy Commissioner reports that in the Khurai Tahsil and in much of the Banda Tahsil the *rabi* harvest must be practically a complete failure, and no material improvement can be looked for until after the rains. A moderately good *rabi* havest is expected in parts of the Saugor and Rehli Tahsils. The Deputy Commissioner of Damoh has omitted to make any remarks under this head. In Mandla and Seoni *rabi* prospects are good. In the latter district local damage has been caused by hail.

10. *Changes in Rates of Wages.*—The Deputy Commissioner of Jubbulpore states that he has changed the rate of wages on the relief works on the Kundum road, but does not state what change has been made. At the close of the month the Deputy Commissioner of Mandla had changed the rate of wages, fixing 8 seers per rupee as the basis of its calculation. Elsewhere there is no change to record. Deputy Commissioners have been asked to state clearly in future reports the price or prices of grain on which wages are calculated.

11. *Railway Work.*—Work on the Saugor-Katni Railway extension continues and the number employed has increased as shown below :—

District.	26th December.	30th January.
Jubbulpore - - - -	6,470	8,784
Saugor - - - - -	6,771	11,975
Damoh - - - - - -	7,487	9,080
Total - - - - -	20,728	29,839

Cholera broke out in the Saugor district in a few villages and is still lingering on, but so far both attacks and deaths have been few.

12. *General Remarks for the Division.*—(*a.*) *Situation of the Division in regard to Famine.*—It was anticipated that the widespread distress due to the failure of the autumn harvest would increase in intensity during the winter months. The following divisional figures compiled from the weekly District Famine Reports show that the famine which had plainly declared itself in December, declared itself more plainly in January :—

	Numbers relieved.	
	26th December.	30th January.
Public Works Department relief works - - - -	38,638	72,841
Relief works under civil officers, including local works at relief centres, &c.	32,208	78,187
A.—Total relief works - - -	70,846	151,028
Gratuitous relief in poor-houses - - - - -	6,111	9,875
All other kinds of gratuitous relief, including dependants on Public Works Department works, &c.	5,015	22,495
B.—Total gratuitous relief - - -	11,126	32,370
Grand total of A. and B. - - -	81,972	183,398

The totals of A. and B. for 30th January differ slightly from those given in columns 10 and 11 of Divisional Statement A. The difference occurs in the Saugor district, and is not important.

(*b.*) *Measures taken to organise and complete Measures of Relief.*—The Saugor and Damoh districts were visited by me (in company with the Chief Commissioner) in December, and plans of relief were brought up to date. In January I accompanied the Chief Commissioner to Mandla and Seoni, and examined and revised the plans of relief for those districts in detail in personal consultation with the Deputy Commissioners, reporting the arrangements and proposals made for the Chief Commissioner's approval or orders. The Deputy Commissioner of Jubbulpore (Mr. Fox-Strangways) has not been much at head-quarters, having been most active in moving about the district, but when we met at head-quarters, we have of course been in frequent personal communication, and since the close of the month we have submitted proposals for the revision and enlargement of the programme of Public Works Department relief works in this district. In other districts the original programme (which admits of expansion by the formation of "new charges" as the demand for employment increases) has not so far required any material revision.

The strengthening of establishments has been one of the chief administrative measures taken during the month of January. Four junior police officers were placed at my disposal, for famine duty; one of them has been posted to Jubbulpore, a second to Damoh, a third to Mandla, and a fourth to Seoni. Three officers of the Forest Department have also been placed on famine duty in this division (since the close of January). The services of two officers of the Indian Medical Service have also been obtained; one of them has been posted to Jubbulpore, and the other to Saugor; they will inspect and supervise all the medical and sanitary arrangements on the relief works and at the poor-houses, &c. There has also been a strengthening of the Tahsil establishments in Mandla and Seoni by the appointment of additional Tahsildars or Naib Tahsildars for famine duty.

The above are the chief points requiring special notice under this head.

(*c.*) *Prospects of the Division in regard to the Scarcity.*—The numbers applying for relief will probably go on increasing until the *rabi* havesting is in full swing, when they may be expected to fall off. The plentifulness or otherwise of the mohwa crops will also affect the situation in certain tracts. Numbers will rise again when the employment furnished by the harvest operations ceases. The gathering of this harvest will probably result in some fall of prices, though prices are not expected to fall much, and will depend as much on the harvest yield in other parts of India as in the Central Provinces. I do not think that any material alleviation of the distress can be expected until the early rain crops are gathered.

COPY of a LETTER, No. 1341, dated the 10th February 1897, from A. H. L. FRASER, Esq., I.C.S., C.S.I., COMMISSIONER, Nagpur Division, to the CHIEF SECRETARY TO THE CHIEF COMMISSIONER, Central Provinces.

I have the honour to forward the monthly Famine Returns for January prepared as prescribed in paragraph 5 of your circular letter No. 313, dated the 19th ultimo. I have given in the memorandum attached to the compiled returns any information that occurred to me, and I have now little to add.

2. Prospects in Nagpur, Wardha, and Chanda are very much what they were. I do not anticipate any trouble in these districts except a little from the effect of high prices on the labouring classes. This will necessitate the continuance of relief works in the Nagpur District. But I hope that private works and the throwing open of the forests will suffice in Wardha and in Chanda. The Ambagarh Chauki-Raj Nandgaon road is necessary in the north-east corner of Chanda for a somewhat distressed tract consisting of part of the Nandgaon State and the Ambagarh Chauki zamindari.

3. In Bhandara and Balaghat also prospects have little altered, except that distress must intensify for the present as time wears on. Much progress has been made in local relief through land improvement advances. And since the close of the month allotments for loans from famine funds have been made. Arrangements are now ready for village relief should that be found necessary. I do not anticipate the necessity in Bhandara, but I do in Balaghat.

4. I think that there must be some little increase of trouble in Bhandara and more in Balaghat as time goes on. But I trust that, if we have a fair monsoon, we may look for the practical cessation of our distress about July. Until then I fear that nothing will occur to diminish it except very temporarily; for the *rabi* harvest will not much affect the distressed areas.

MEMORANDUM.

Private Relief.—During the month of January there were five private institutions for famine relief, viz., Nagpur 2, Balaghat 2, and Wardha 1. The last-mentioned was closed on the 14th of the month. Private subscriptions amounted to Rs. 1,552, of which Rs. 860 were expended. In Nagpur, Bhandara, and Balaghat the amounts raised by private charity have hitherto been spent on poor-houses, as this was the desire of the subscribers. Several private gentlemen, such as the zamindars of Baila and Hatta (in Balaghat) and Amgaon (in Bhandara) have been supporting poor families as well as feeding destitute wanderers.

Poor-house Relief.—There were 9 poor-houses, viz., 2 in Nagpur, 4 in Bhandara, and 3 in Balaghat. Though both the poor-houses in Nagpur and 2 in Bhandara and 2 in Balaghat are maintained from private subscriptions, yet they are regarded as Government poor-houses inasmuch as they are being worked on the lines of the Famine Code. The other three are private poor-houses. No fresh poor-houses were opened during the month. The number of inmates of the poor-houses on the last day of January was 2,341 (viz., Nagpur 540, Bhandara 652, Balaghat 1,149) as compared with 2,264 (viz., Nagpur 920, Bhandara 386, Balaghat 958) on the corresponding date of the previous month. The falling off in the numbers in Nagpur is due to immigrant paupers from other districts having been sent back to their homes, and the increase in Bhandara to the transfer of paupers (residents of this district) from Wardha and Nagpur.

Village Relief.—It has not been found necessary to establish relief centres in Nagpur. Nor is there anything of this kind in Bhandara except the kitchens established for children at police station houses and outposts. Three relief centres were opened during the month in Balaghat, and the number relieved there was 70 at the close of the month. No works have yet been started at these centres. But there are private tank works in their immediate neighbourhood. The number of persons relieved in their homes was 15 in the Balaghat Tahsil and 164 in Bhandara. In Bhandara there is no necessity felt for this kind of relief; but in Balaghat it seems to be becoming necessary. Further arrangements are, therefore, being made in this district for the relief of destitute people in their own homes.

General Character of Relief Works.—Nagpur.—There are four relief work camps and the work consisted of stone-breaking for metalled roads. The number employed on

these works was 1,268 at the close of January as compared with 2,228 at the close of December. The decrease is attributed to a temporary demand for field labour. A good deal of money has been allotted for land improvements, but not from famine funds in this district. No new works, Public Works Department or otherwise, were opened during the month.

Bhandara has five relief work camps under the Public Works Department in progress. The number employed on them was 8,933 at the end of January against 7,109 at the end of the previous month. In addition to this, 1,462 persons were relieved gratuitously on the works on 30th January as against 524 at the end of December. One of the five camps really belongs to Balaghat, viz., the Amgaon-Lanji Road camp. Only two miles of the road are in the Bhandara District. A considerable sum has been advanced for land improvements in this district; and since the beginning of February an allotment from famine funds for private works has been made.

Chanda.—The only relief work here consists of the construction of the Ambagarh Chowki-Raj Nandgaon Road. This is for the relief of distress in the north-east corner of the district. The sum allotted is Rs. 15,000, half being contributed by Government and half by the estate; 2,700 persons are employed on this road, of whom about one-half are from Raj Nandgaon. An allotment for land improvements has been made, which may obviate the necessity for any further Government relief.

Wardha.—One test work which was opened on the Wardha-Pannar Road on the 13th November 1896 was closed on the 16th January, as there was no further necessity for its continuance.

Balaghat.—The works in progress during the month were—

1. Lalburra-Rampaili Road.
2. Balaghat-Behir Road, sections I. and III.
3. Bakhori Kona Tank.

Work No. 1 was re-opened during the month and the number of labourers on it was 1,884. These have mostly been drafted off from the 1st section of work No. 2, on which only 35·7 persons have been left to finish whatever little has now remained to be done. On the 3rd section of the Balaghat-Behir Road, the number was 1,477 against 854 in the previous month. Work No. 3 is a Government tank in a ryotwari village. It was started during the last week of the month, the number employed thereon being 471. This is said to be rapidly increasing, and arrangements are being made to take more tanks in hand. Sums aggregating Rs. 40,000 were advanced during the month to malguzars for land improvements; and an enormous number of people are thus locally employed. Works have been arranged for in 350 villages.

Physical Condition of the People.—Nagpur.—A few cases of emaciation were observed, but these were invariably of travellers from other districts or provinces. The condition of people on relief works is generally good, and cases of emaciation among them are very rare.

Bhandara.—The condition of the people on the works and in the distressed tracts generally is fairly good; cases of emaciation are rare. In the poor-houses the condition of the people is much worse, a large proportion of inmates being infirm from age or disease.

Chanda.—The condition of workers is generally good. Only wanderers from distant places beyond the district are in a bad state.

Wardha.—Condition good.

Balaghat.—Condition fair. The people on gratuitous relief are not infrequently weak and emaciated. But the general condition of the people in the distressed areas is fairly good. And the workers on the relief works are in good condition.

Nagpur.—Deaths from Starvation.—The total number of deaths due to or accelerated by privation is 30. Of these, three occurred in poor-houses and the rest on the main roads. There is no cholera or small-pox in the district.

Bhandara.—Thirty-one deaths are attributed to starvation against 25 in December. These were practically confined to unknown wanderers who have been found dead on the road. The total number of deaths was 2,578, of which 134 were due to cholera. Deducting this latter figure the death-rate is 3·29 per mille per mensem.

Chanda.—There were three deaths from starvation. One of these was an old woman who died a couple days after she came on the works. The other two were of men from the Raj Nandgaon State.

Wardha.—No deaths from starvation.

Balaghat.—The total number of deaths from all causes during January was 1,293 against 1,998 during December. This gives a death rate of 3·37 against 5·21 per mille. The total number of deaths from starvation was 167, of which 107 occurred in poor-houses. Most of these cases were among persons who were admitted in an extremely poor condition for any treatment. The returns are not quite trustworthy; and inquiry has been ordered. Probably many of these deaths were accelerated by starvation, but not caused by it.

Food Stocks.—In Nagpur, Bhandara, Chanda, and Wardha food-stocks are generally sufficient. In Balaghat there is reason to believe that the food-stock is exceptionally small. And the prospects in regard to both food and seed grain occasion anxiety. Prices are gradually rising and the food-stock is decreasing. This is especially true in the landlocked Tahsil of Behir.

Importation of Grain.—The figures for Nagpur and Bhandara are as follows :—

	Imports in Maunds.			Exports in Maunds.		
	Rice.	Wheat.	Juari.	Rice.	Wheat.	Juari.
Nagpur - - - -	62,887	11,231	9,088	2,276	262	231
Bhandara - - - - -	5,778	1,017	—	792	1,111	—

The figures for Bhandara relate only to the municipal portion of the district. The exports from Nagpur were principally made to Calcutta, Cawnpur, and Khandesh. There has been practically no importation of grain into the other districts of the division.

General Condition and Prospects of Affected Area.—There is practically no change in the condition of the affected area in Nagpur and Bhandara. Severe distress is confined to the Balaghat district and to an area comprising about 500 square miles in the Bhandara Zamindaris, where no rabi crops exist. The worst part is the Behir Tahsil of Balaghat, a thinly-peopled tract. In Wardha the general condition is good, and no area is affected at present.

Changes in Rates of Wages.—Nagpur.—There has been no material change.

Bhandara.—Wages have been paid on the basis of rice at 10 seers per rupee throughout the month on all relief works. The price of common rice is expected to rise in February.

Chanda.—Owing to a rise in the price of food from 12 to 10 seers, wages had to be raised.

Balaghat.—Prices have risen and wages are paid on the scale of nine seers per rupee.

State of Crime.—In Nagpur crime has been for the most part petty. There were no dacoities during the month. There were, however, three robberies, but none of them of a serious nature. Both in Nagpur and Balaghat there has been an increase in crime, due, no doubt, to the prevailing high prices.

COPY of a LETTER from the COMMISSIONER, Nerbudda Division, No. 213c., dated the 13th February 1897, to the CHIEF SECRETARY TO THE CHIEF COMMISSIONER, Central Provinces.

With reference to paragraph 5 of Revenue Department letter, No. 313, dated 19th January last, I have the honour to forward herewith consolidated statements A. and B. for the Chhindwara, Betul, and Nimar districts of this division for the five weeks ending the 30th ultimo. As the statements for Hoshangabad and Narsinghpur have not been received up to date, despite urgent reminders from this office, I am unable to include the figures for those districts. I delayed this report for three days in the hope that I might be able to include them. In the accompanying letter, dated 10th instant, the Deputy Commissioner of Narsinghpur explains the delay, and promises submission of the statements shortly. I append the prescribed memorandum, though it is necessarily incomplete.

2. The situation of the division as regards famine during and at the close of the month under report shows little change. The rainfall at the beginning of the month improved the rabi prospects in the Chhindwara district, and to a less extent in the Betul district. In the Hoshangabad and Narsinghpur districts it was not of unmixed benefit. Although the cultivated area of the Nimar district is practically free from famine, there is distress, I find, in the ryotwari and summarily-settled tracts, and also among the korkus in the Government forests to the south and east (*see* my letter, No. 186 C., dated the 6th instant).

The existence of distress in the areas already recognised as famine stricken was emphasised during the month by a large accession to the number of labourers on relief works, and by a considerable increase in the population of poor-houses. The total of relief workers on the 30th ultimo was 67,260, as compared with 28,957 on the 26th December last.* Nowhere was the increase more marked than in the Hoshangabad district, where within a few days of the opening of the Harda-Handia road over 9,000 persons flocked to the work. The number of inmates of poor-houses rose from 1,630 on 26th December last to 3,374 on the 30th January. The physical condition of the labourers on relief works was generally good, except in the case of the *Bagdeo* work (on the Itarsi-Dhar road) referred to in my last letter. On the other hand, most of the recipients of gratuitous relief are, in all districts, reported to have been much emaciated when first admitted to the poor-house or brought upon the relief register.

3. Among the steps taken during the month towards organising and completing measures of relief were the following:—Three new roads were open as relief works—one in the Betul district (the Badnur Harda road), one in the Nimar district (the Mohghat road), and one in the Hoshangabad district (the Harda-Handia road). The workers on the Piparia-Sobhapur road were transferred to the Piparia-Pachmarhi road, whereon three separate "charges" or "camps" were constituted, viz., at Pawari, Matkuli, and Pagara. The total of large relief works open in the division was thus raised from 14 to 18. A minor or "village" work (the excavation of a tank) was started by the Jagirdar of Harrai, in the Chhindwara district, and another tank was commenced by the Court of Wards at Tamier in the Pagara Jagir. New poor-houses were opened at Chota Chhindwara in the Narsinghpur district, at Amarwara in the Chhindwara district, and at Khandwa and Burhanpur in the Nimar district. The total number of Government poor-houses in the division was thus raised from six to 10. The poor-house at Amarwara replaced a private institution supported by the missionaries, and was designed to meet the distress in the Jagirs. Those at Khandwa and Burhanpur are chiefly for the starving migrants who enter or leave the Central Provinces by the gateway of Nimar.

Up to the beginning of January the management of large relief works remained with Deputy Commissioners (assisted by Public Works officers), but orders were received in the first week of the month for the transfer of charge to the Public Works Department. This transfer was carried out gradually, so as to avoid any dislocation of the arrangements in force. The supervision of the district officers was at the same time maintained. In order to render it more effective, instructions were issued by this office (with the assent of the Public Works Department) for the use of inspection books, and the transmission of copies of the remarks of inspecting officers to the Commissioner, and the Executive Engineer (this office No. 116 C., dated 24th January).

A set of rules for organising labour on minor relief works under civil officers was prepared by me and submitted to the Chief Commissioner, by whom they were approved and issued in circular form. In this office No. 29 C., dated 8th January, the attention of all Deputy Commissioners was invited to the necessity of organising gratuitous relief in towns as well as in villages; and it was suggested that in municipal towns the aid of ward members should be enlisted. Relief "centres" or "kitchens" were, with the approval of the Public Works officers, established at all major relief works in the division, the object being to feed gratuitously for a few days all applicants for work whose physical condition precluded their being at once put to labour, instead of sending them to a poor-house at tahsil head-quarters, under Article 77 of the Famine Code (this office No. 121 C., dated 24th January). A plan (originated in part by the Deputy Commissioner, Narsinghpur) for organising relief at police posts, was communicated to all Deputy Commissioners (this office No. 108 C., dated 23rd January), and in order to stimulate effective action by the police in feeding and forwarding starving wanderers, a monthly return of persons so dealt with was prescribed in this office No. 70 C.,

*The latest date to which my previous report related.

dated 16th January. Orders were issued to Mukaddams under Article 33 of the Famine Code. The attention of all District Officers was called to the details of the scheme for the distribution of gratuitous relief in forest tracts which had been elaborated for the Chhindwara Jagirs (as noted in my report for December), and Mr. Bagley, Extra Assistant Commissioner, was specially deputed to visit the forest areas of Betul and put the scheme in force there. The distribution of gratuitous relief in villages was commenced in the Narsinghpur, Chhindwara, and Betul districts. The sanction of the Chief Commissioner was obtained (Revenue Department letter No. 113 C., dated 18th January) to the reduction of the forest dues on bamboos and articles manufactured therefrom by 50 per cent. so as to benefit Gonds and Korkus, and to the remission of grazing fees in respect to plough-cattle, so as to benefit cultivators generally. The new rules regarding the grant of loans for land improvement, *free of interest*, were communicated to all district officers. Finally, the sanction of the Chief Commissioner was obtained (Revenue Department letter No. 170 C., dated 24th January) to the suspension of the Kharif Kist till the 1st June 1897 in the Tahsils of Hoshangabad and Sohagpur in the Hoshangabad district.

4. As regards the future, it appears unlikely that there will be any important diminution, before the autumn, in the number of persons requiring relief. The harvest now begun will draw away a certain number of cultivators from our works for a time; but as the area sown is considerably below the normal, and the outturn is likely to be poor in districts other than Nimar and Chhindwara, it is not to be anticipated that the *rabi* crops will provide food for the majority. So far as the aboriginal tribes are concerned, much depends upon the *mohwa* crop; but the abnormal weather which we have lately been experiencing has not improved its prospects.

MEMORANDUM.

(1.) *Private Relief.—Nimar District.*—In Burhanpur, Rs. 577 were subscribed in December 1896 and Rs. 256-8 in January 1897. This sum is spent in affording gratuitous relief by a committee. Total expenditure up to end of January is Rs. 690. The attendance on 30th January was 162, as against 216 at the end of December.

In Khandwa Rs. 443 were subscribed in January 1897. This money has not yet been spent.

Betul District.—About Rs. 1,500 has been subscribed by private persons up to the present. Of this Rs. 449 was expended on the maintenance of the poor-house at Badnur, till that institution was taken over by Government, and about Rs. 400 was advanced to circle inspectors and others for the relief of urgent cases during the time that gratuitous relief registers were being prepared. The balance remaining will now be expended by the Committees of Badnur, Betul, and Multai on the support of persons entitled to gratuitous relief in these towns.

Hoshangabad.—No report received up to the 8th February 1897. Copy of this office No. 1358, dated 7th February 1897, is appended for information.

Narsinghpur.—No report received up to the 8th February 1897. Copy of this office No. 1358, dated 7th February 1897, is appended for information.

Chhindwara.—Private relief of an organised character is confined to the municipal town of Chhindwara, where it is administered to 116 persons whose caste and social status debar them from the public forms of relief.

(2.) *Poor-houses.*—Two new poor-houses were opened in Nimar during the month. Another was opened at Amarwara in the Chhindwara district (and a third at Chota Chhindwara in the Narsinghpur district).

Inmates.	On 26th December.	On 30th January.
Nimar - - - -	Nil.	16
Chhindwara - - - -	98	308
Betul - - - -	74	239

(3.) *Village Relief.*—There are 14 "relief centres" in the jagirs of Chhindwara, and one is reported to have been established at Harsud in the Nimar district. The number relieved at these centres is 623 for Chhindwara and six for Nimar. In all districts the

relief camps or major relief works have now been made "relief centres" (*see* my forwarding letter).

The number of persons relieved *in their homes* is 241 in the Chhindwara district, 449 in Betul, and nil in Nimar.

(4.) *Relief Works.*—The list of roads given in the memorandum for December may be taken here with the following modifications:—Add in Betul the Badnur-Harda road, in Nimar the Mohghat road, and in Hoshangabad the Harda-Handia road. Omit in Hoshangabad the Piparia-Sobhapur Road, and add the following to the Piparia-Matkuli-Pachmarhi Road:—*Works at Panari and at Pagara.*—The numbers on the works are given by the Deputy Commissioners of Nimar, Betul, and Chhindwara as under:—

(For the divisional total, *see* my forwarding letter.)

——	On 26th December 1896.	On 30th January 1897.
Nimar - - - -	452	550
Betul - - - - -	884	10,747
Chhindwara - - -	—	5,782*

There were also two tank construction works in the Chhindwara Jagirs, employing 2,140 persons.

(5.) *Physical Condition.*—The physical condition of the labourers on relief works is reported to be fair. On the other hand, persons in receipt of gratuitous relief are said to be much reduced by privation.

(6.) *Deaths from Starvation.*—The following figures represent the reported deaths from starvation:—

Chhindwara - -	14 deaths.
Betul - -	28 deaths (including eight in the poor-house).
Nimar - -	48 deaths (including five in the poor-house).

(7.) *Food Stocks.*—No district officer reports the food stocks to be insufficient. In Chhindwara they are "ample" and in Nimar "sufficient."

(8.) *Importation of Grain.*—The Deputy Commissioners of Nimar and Betul give figures of import and export of grain which need not be reproduced here.

(9.) *General Condition and Prospects.*—The Deputy Commissioner, Betul, does not anticipate any great benefit from the reaping of the rabi, as the area sown is small. He looks to the mohwa crop. The Deputy Commissioner, Nimar, considers that only the jungly tribes are badly off, the agricultural population being in fairly good case. The Deputy Commissioner, Chhindwara, says that the prospects "remain unchanged."

(10.) *Changes in the Rate of Wages.*—The Deputy Commissioner, Betul, says that wages are still calculated at the rate of 10 seers to the rupee, overlooking the fact that in his report for December he wrote that it had been found necessary to raise the rate from 11 seers to 9 seers (*see* my memorandum for December). The other districts report "no change."

(11.) *Other Matters.*—The Deputy Commissioner, Nimar, observes that "crime appears to be on the increase." (As his district is practically free from famine, it does not seem easy to connect this fact with the scarcity.)

MEMORANDUM ON MONTHLY FAMINE REPORTS ending 30th January 1897, submitted by the Deputy Commissioners, Raipur and Bilaspur.

(1.) *Private Relief.*—In Bilaspur Rs. 2,968 is reported to have been raised during the month in private charity for the support of the poor-houses at Bilaspur, Mungeli, and Pandaria, and of the relief centre at Bhatapara. The Bilaspur and Mungeli poor-houses have been taken over by Government, and it is proposed that the Pandaria poor-house is shortly to be taken over. The total number relieved at the poor-houses was 1,345, but the Deputy Commissioner does not state what portion of the expenditure was debited to private funds. The Deputy Commissioner, Raipur, reports that 225

* Should be 4,950 according to weekly statement.

persons were relieved at Deokar and at Gandai by private charity, but the amounts are not stated, nor is it reported what subscriptions were received from private persons in aid of the poor-houses.

(2.) *Poor-house Relief.*—The locality of the poor-houses in the Bilaspur district has been reported above. The number relieved was, as stated, 1,345, against 508 at the close of the preceding month. In the Raipur district there are poor-houses at head-quarters, Simga, Dhamda, Arang, and Baloda. The total number in these houses at the close of the month was 695. All these poor-houses were formerly under private management, but they have now been taken over by Government and are supported mainly from famine funds.

(3.) *Village Relief.*—A relief centre has been organised at Bhatapara in the Bilaspur district. But this system of relief and village relief have still to be organised, and the Deputy Commissioners are giving the subject their earnest attention. Twelve relief centres have been already approved of by the Deputy Commissioner for the Raipur district.

(4.) *General Character of Relief Works.*—In the Raipur district, the Simga-Kawardha, the Tilda-Sirpur, and Dhamda-Deorbija roads were already started as relief works. To these was added during the month a fourth work, the Drug Gunderdhi section of the Drug-Balod road. In the Bilaspur district the Bhatapara-Mungeli and Bilaspur-Mungeli roads were started as relief works under the Public Works Department during the month. The number of relief workers employed on these two roads were, respectively, 1,683 and 3,234, excluding 92 and 11 dependants, who were fed gratuitously. The Deputy Commissioner, Raipur, has omitted to state the number employed on each of the four road works in progress in his district. As regards local works in the Raipur district, a tank is under construction at Baloda, as an adjunct to the poor-house, repairs to the ghat at Randghat are being executed, and certain wells are being constructed. Fencing of certain fuel and fodder reserves is also in hand. In the Bilaspur district no local works are reported to have been opened at the expense of the famine grant, as they were not necessary. In the zemindari estate of Pandaria, however, the Pandaria-Lormi road was started from estate funds, and much relief is afforded by this work, the total number at work on the last day of the month being 1,327. Famine loans are being largely advanced in both districts for starting local irrigation works for the relief of distress, and works are also being started by malguzars and zamindars from their own pocket. Exact figures are not reported as to the extent of relief afforded in this direction.

(5.) *Physical Condition of the People.*—The Deputy Commissioner, Bilaspur, reports that even in distressed tracts the condition of the people was generally good, though cases of emaciation were to be found in the more severely affected tracts. Similarly, in the Raipur district cases showing privation of food were observed in the severely affected areas, and especially in some of the villages of the north-western zamindaris. The Deputy Commissioners have taken prompt action to relieve all such cases, and local works have been started. As regards relief workers on the large roads, the Deputy Commissioner, Bilaspur, reports their condition to be good. The state of the people on the Raipur works is reported by the officers, who have recently inspected them, to be good, and the fact that the death-rate for December for the whole district was only 2·96 per mille, and was considerably less than the rate for the same month last year, shows that there is as yet no severe distress. At the poor-houses the people come in generally in a poor condition, but recover rapidly, and those who have been some time in the poor-house, excepting a few affected with chronic diseases, are in good condition.

(6.) *Deaths from Starvation.*—For the Bilaspur district 47 deaths from starvation are reported in the Bilaspur tahsil, 109 in the Mungeli tahsil, and 4 in the Sheorinarain tahsil. Many of the deaths occurred in poor-houses. The Deputy Commissioner has been asked to examine the figures carefully and to report what action has been taken to check the mortality from starvation. For the Raipur district figures are not available, but the mortality figures give no reason to suppose that deaths from this cause were otherwise than quite exceptional.

(7.) *Food stocks* are reported to be generally sufficient.

(8.) *Importation of Grain.*—The grain imported has been insignificant in both districts. Exports, on the other hand, have been rather considerable, 93,748 and 120,870 maunds respectively were exported from the Raipur and Bilaspur districts to other districts in the Central Provinces and outside the Province.

(9.) *General Condition and Prospects of Affected Area.*—Little information is given in the Raipur report. In the Bilaspur district distress has become more severe in an area consisting of 25 villages east of Ratanpur. This area was till recently slightly affected with distress. Local works here are reported to be sufficient for the relief of the distressed. The Deputy Commissioner, Bilaspur, hopes that the condition of the Bilaspur and Mungeli tahsils will be ameliorated when the rabi harvest begins. The Deputy Commissioner, Raipur, also hopes the same in the affected areas where a good rabi crop has been sown.

(10.) For the calculation of wages, the price of grain is taken at 10 seers per rupee in Bilaspur, and from 9 to 10 seers in Raipur.

(11.) *Other Matters.*—As regards the state of crime, the number of thefts in Bilaspur are on the increase, and eight dacoities were reported during the month. It is not stated how many of these were thefts of grain. As might be expected, there have been a number of such thefts in both districts. In the north-west part of Raipur special precautions have been taken by the district superintendent of police to prevent looting of the standing crops by Chamars, who are inclined to commit crimes of this kind.

No. 1047, dated Nagpur, the 19th February 1897.

From H. H. PRIEST, Esq., I.C.S., Chief Secretary to the Chief Commissioner, Central Provinces, to the SECRETARY TO THE GOVERNMENT OF INDIA, Department of Revenue and Agriculture.

In continuation of this Administration's letter No. 975, dated the 17 instant, I am directed to forward herewith Monthly Famine Statements A. and B. of the Narsinghpur District for the month of January 1897, with a copy of the Deputy Commissioner's remarks and a map of the district coloured to show the extent and intensity of the existing scarcity.

2. I am to add, with reference to paragraph 6 of the summary of information regarding the districts of the Nerbudda Division, forwarded with my No. 848, dated 11th February 1897, that inquiry has shown that the figure shown against Narsinghpur as deaths from starvation really represents the total number of deaths from all causes in that district during the month of December. There were no reliable statistics of deaths from starvation in Narsinghpur during December. I am accordingly to ask that in the figured statement of reported deaths from starvation, given in paragraph 6 above referred to, the words "no return" may be substituted for 1859, and that the total may be put as 33 instead of 1892. In column 16 of Famine Statement A., forwarded with the same letter, the figure 385 shown against Narsinghpur should be deleted.

Monthly Famine Statement A. for the Five Weeks ending 30th January 1897.

(To be submitted to the Government of India within the first half of the next month.)

District.	Area.	Population in Thousands.	Affected Area.	Estimated Population in Thousands of Column 4.	Numbers on Relief Works on Last Day of Month.					Number on Gratuitous Relief. REMARKS on FAMINE STATEMENT A. for January 1897 (NARSINGHPUR DISTRICT).

Private Relief.—At Narsinghpur endeavours were made to raise a fund from private charity in the first place for supply of blankets to the inmates of the Government poor-house and afterwards, when the supply of this need at Government expense had been sanctioned, for the provision of cotton clothes. A sum of Rs. 130 which remained over from the fund originally raised for feeding paupers in the town before the establishment of the Government poor-house, was supplemented by contribution raised during the month to the extent of Rs. 300. This money was in course of being expended on the purchase of cotton clothing for the poor-house, when the necessity for doing so was obviated by the munificence of an individual, Pandit Beni Prasad, who presented a full supply at his own sole expense. The money is for the present being held in reserve for future needs.

Arrangements were in progress, but had not been completed by the end of the month, for enlisting private charity in the work of gratuitous relief within the town of Narsinghpur.

At Chhindwara, as at Narsinghpur, a subscription list was opened for the purchase of cotton clothing for the poor-house there established. The amount subscribed within the month was Rs. 248.

Efforts were made to provide as far as possible from private charity for gratuitous relief in the villages generally. Up to the close of the month, the relief of 68 persons on the mukaddams' lists had been arranged for from this source. Assuming Rs. 2 per mensem to be the cost of feeding each of these persons, this represents a monthly charitable subscription of Rs. 136.

Poor-house Relief.—There were three Government poor-houses at Narsinghpur, Gadarwara, and Chhindwara, the last named having been opened during the month with effect from the 1st January. The number of inmates on the 30th January in each of these institutions was respectively 928, 926, and 288, being an aggregate of 2,142. On the last day of the preceding month the numbers were, Narsinghpur, 524; Gadawara, 458; total, 982.

Village Relief.—There were 21 relief centres, all of which were newly established during the month, at the several police stations, houses, and outposts. The number gratuitously relieved at these centres on the last day of the period under report was 1,594. No regular works were opened at any of these centres. The number of persons relieved *in their homes* on the same date was, in the Narsinghpur tahsil, 224, including 68 persons above referred to as supported by private charity; in Gadarwara, 52. The arrangements have not yet been completed. They are being started personally, in different parts of the district, by the Tahsildars, the Superintendent of Land Records and his Assistant, and by the Manager, Court of Wards, in the villages under his jurisdiction. As soon as the arrangements have been fairly started by these superior officers in each village, the immediate responsibility for their continuance will, subject of course to the usual control, devolve on the Revenue Inspectors, who will draw the necessary advances and distribute to each mukaddam an amount equal to 15 days' sustenance of all the persons retained on his list, the mukaddam being aided and controlled in the duties of detailed distribution and of maintaining accounts by the Patwari, the schoolmaster, and a local committee. Where the relief is undertaken by private charity, the system is less elaborate, all that is demanded being a satisfactory assurance that all persons included in the mukaddams' list are being regularly and sufficiently fed.

Relief Works.—There are five large works, as in the preceding month, all of which were made over to the charge of the Public Works Department, with effect from the 14th January. They consisted of—

(*a.*) Construction of the Gadarwara-Sanikhera road, starting from Gadarwara in a north-westerly direction. Earthwork and excavation of kunkur. Number on last day of the month, 7,740, as compared with 2,691 of the previous month.

(*b.*) Metalling of Barman-Tendukhera road, near Barman. Excavation of kunkur; number on last day of the month, 3,674, as compared with 1,077 of the previous month.

(*c.*) Metalling of the Narsinghpur-Lakhnadon road, near Bachai, 10 miles south of Narsinghpur. Stone-breaking and mooran excavation; number on last day of the month, 2,029, as compared with 786 of the previous month.

(*d.*) Metalling of the Saugor-Kareli road, near Barman. Stone-breaking: number on last day of the month, 1,171, as compared with 177 of the previous month.

(*e.*) Construction of the Narsinghpur-Sankal road, starting from Narsinghpur in a north-easterly direction. Earthwork: number on last day of the month 6,810, as compared with 1,285 of the previous month. There were no local works carried out either with the aid of famine loans or directly by Government.

Physical Condition of the People.—On this point I cannot do better than reproduce my remarks for December, with which the Civil Surgeon informs me that his experience entirely coincides. (*a.*) Those in receipt of gratuitous relief were generally more or less emaciated, in some cases very much so, and a considerable proportion of persons reached the poor-houses in advanced stages of privation and disease. (*b.*) On works the general physical condition was distinctly good, the proportion of B. class labourers being large, and cases of emaciation very exceptional. (*c.*) In distressed tracts generally (that is, taking the district as a whole) the physical condition of the mass of the people cannot be said to have been very perceptibly reduced. Very painful sights were indeed frequently to be seen, but considering the population collectively, it may safely be said that emaciation was exceptional.

Deaths from Starvation.—No later figures are available of total mortality than those given in the statement for December, amounting to 1,859, with a death-rate of 5·06. The number of deaths returned as due to starvation outside poor-houses in January is 238.

In the Narsinghpur poor-house, with a strength of 928 on the last day of the month, there were nine deaths due to want of food, and 65 to illness induced by want of food, the total death-rate being 108·46. In the Gadarwara poor-house, with a population of 926, there were 49 deaths, of which 29 were due to illness induced by want of food, the death-rate being 61·71. In the Chhindwara poor-house, among 288 persons, there were 27 deaths, one of which was ascribed to want of food, and 24 to illness induced by want of food, the death-rate being 106·72.

Food-stocks.—There have been no signs of depletion, and no complaints.

Importation of Grain.—Two hundred and thirty-five maunds of grain (rice and *pissi* in about equal proportions) were imported into Narsinghpur, while 1,376 maunds, chiefly of *mung* and *masur*, were exported from Gadarwara.

General Condition and Prospects of Affected Area.—In the area shown as *most* affected there has been a practically total failure of *kharif*, and little, if any, *rabi* sown; in forest villages, jungle fruits, &c., will afford some subsistence; otherwise the whole population of this area will need relief. In the remainder a 7 to 8 anna *rabi* crop is hoped for; but distress will nevertheless be severe, and a large proportion of the people will probably need relief.

Changes in Rate of Wages.—There have been no noteworthy changes in rates of wages.

Other Matters, &c.—The number of offences reported during the month was 336 against 261 in the preceding month and 150 in the corresponding month of 1895.

No. 1188, dated Nagpur, the 23rd February 1897.

From H. H. PRIEST, Esq., I.C.S., Chief Secretary to the Chief Commissioner, Central Provinces, to the SECRETARY TO THE GOVERNMENT OF INDIA, Revenue and Agricultural Department.

In continuation of this Administration's letter No. 1047, dated the 19th instant, I am directed to forward herewith Monthly Famine Statements A. and B. for the Hoshangabad District, for the month of January 1897, together with a copy of a note recorded by the Deputy Commissioner, and a map of the district.

This completes the submission of the prescribed Famine Statements and Reports for the month of January.

Monthly Famine Statement A. for the Four Weeks ending Saturday evening, the 30th January 1897.

District.	Area.	Population in Thousands.	Affected Area.	Estimated Population in Thousands of Column 4.	Numbers on Relief Works on last Day of Month.					Number on gratuitous Relief.	Price of One or more principal Food-grains in Seers per Rupee.				Monthly Death-rate.	Deaths due directly or indirectly to Privation.

NOTE to accompany FAMINE STATEMENTS A. and B. HOSHANGABAD DISTRICT.

1. The Friends' Foreign Mission is the principal institution giving private relief, and no details are available. They have established two children's homes, one for boys, and one for girls, into which they receive any children whose parents are unable to support them and wish to find a temporary home for them. The parents are allowed to remove them if they wish.

Certain of the larger Mahajuns also regularly distribute food, and at Pachmarhi about 75 persons are fed by charity. Many of these are orphan children, and will now be brought to the orphanage at Hoshangabad.

2. No new poor-houses have been opened during the month. Her Highness the Begum of Bhopal has removed all her subjects from the Hoshangabad poor-house and undertaken to do the same thing at Sohagpur. The numbers in the poor-house on the 30th January were 624 as against 476 on the last Saturday in December.

3. *Village Relief.*—The police have begun to deal with wanderers in accordance with the Code, and such persons are now being regularly forwarded to the nearest relief work or poor-house.

Gratuitous relief to persons in their homes is not yet started, and I have some doubt whether it is really required on any large scale. There appear to be comparatively few persons falling within the provisions of the Code who are entitled to it, and a careful scrutiny of the lists submitted shows that many of the persons entered are those who are ashamed to work or beg, often purdahnashin women. These apparently can only be aided by charity and not from Government funds.

4. With the exception of a small relief work in the Hoshangabad Public Garden, all relief works are in the charge of Public Works Department.

There are four in the Sohagpur tashil, all on a line running north and south through Piparia, and provide ample relief now for that tahsil.

The next work to the west is the Bagra-Babai Road, which has had far too many workers on it for a charge.

Orders have now issued that another work should be opened there. The next work is at Bagdeo on the Itarsi-Betul road, intended principally for the hill people round Bordha and Kesla, the most distressed part of the district. In Seoni Tahsil no works have been found necessary, but in Harda the Hurda-Hundia road, which was opened at the beginning of the month, has proved that there was more distress than was thought. Harda town supplied some 16 per cent. of the workers, but the majority have come long distances from Charwa or the hills in the south of the tahsil, and even from parts of Sohagpur and Hoshangabad. These latter were almost all wanderers who were on their way back from cutting the *kharíf* crops in Nimar and Indore.

The numbers on works have steadily risen from 12,808 on the 26th December to 30,907 on the 30th January.

5. I have during the month seen the whole district. In the southern hills there is acute distress, and this is shown in the physical condition of the people who come on the work from those parts, notably at Pagara, Mutkuli, and Bagdeo.

The children are especially emaciated, and special arrangements are being made for their feeding.

In the plain portion of the district the condition of the people is better, and cases of emaciation are less frequent, but are still by no means uncommon.

6. The latest returns show that in the month of December the death-rate was considerably higher in the Sohagpur tahsil than last year, being 62·4 per mille as against 40·9 last year. As the population of all the other tahsils has been altered since the 1st October, it is impossible to compare the figures at present until the new population have been calculated. For the first three weeks in January also the death-rate in Sohagpur has been abnormal, being 59·6 as against 27·4 last year, and for the whole district it has been 47·3 as against 32·3 last year.

There have been 106 deaths in poor-houses and 38 on relief works in January, the mortality being greatest at Bagdeo and Pagara.

7. The food-supplies are sufficient, except that, for a short time at the close of the month, there was no jowari in stock at Hoshangabad.

8. I have been unable to get any definite information regarding imports or exports of grain, but it appears, as far as I can learn, that trade is very slack.

No. $\frac{683}{111-8}$ F., Calcutta, the 27th February 1897.

From T. W. HOLDERNESS, Esq., C.S., Deputy Secretary to the Government of India, to the CHIEF COMMISSIONER, Central Provinces.

Sir,

I am directed to acknowledge the receipt of Mr. Priest's letter No. 849, dated 12th February 1897, submitting a further report on the prevailing scarcity in the Central Provinces. The report describes the situation in each district as it now presents itself to you; specifies the areas affected and their general circumstances; indicates the scheme of relief which is in operation; shows the number and classes of people who have been and are in receipt of relief; forecasts, as far as the data now available permit, the probable future duration and extent of the distress; and estimates the aggregate numbers who will be in need of relief.

2. I am to convey the thanks of the Government of India to you for the very full and clear manner in which you have made them acquainted with the situation, and have explained the nature and extent of the relief measures which have been adopted to meet the varying circumstances of the districts in which either distress at present exists in a more or less acute form or may shortly be expected to occur. These measures are in conformity with the recognised principles of famine relief and the provisions of the Provincial Famine Code; they are evidently the outcome of much anxious consideration and inquiry on your part and on the part of the local officers with whom they have been worked out, and they appear to the Government of India to be eminently satisfactory, and they should prove sufficient to meet existing and probable distress. The Government of India note with special approval that in districts in which distress is general and serious, village relief has been organised; that numerous poor-houses have been established; and that relief centres, which are well adapted to the circumstances of the wilder parts of the country, are also established in many places. Your arrangements for remitting and suspending the land revenue, for throwing open the forests to the people, and for setting labour in motion by means of advances to landlords and to cultivators, are approved.

3. The numbers on relief on the 23rd January in 15 districts are returned in Table A., at 245,902, of whom 206,210 were employed on relief works, and 39,692 were in receipt of gratuitous relief. By the 16th February these numbers had risen to 307,048, of whom 238,299 were on relief works, and 68,749 in receipt of gratuitous relief. There were also 50,228 on railway and private works in six districts. The affected area covers 45,000 square miles, with a population of 6,000,000 persons, and you roughly estimate that between the 1st February and the end of September, relief will be required for 61 million units, reckoning each person relieved in each day a separate relief-unit.

4. Your application (paragraph 25) for a supplementary grant of 13½ lakhs to meet the anticipated expenditure on famine relief up to the 31st March 1897, as the original grant of 15 lakhs has proved insufficient, has been separately disposed of.* The question of advances for land improvements discussed in the succeeding paragraph (paragraph 26) has been disposed of in my letter No. 493—73-2 F., dated 9th February 1897, and the three lakhs specially applied for by you for advances for seed-grain in Balaghat and Chhattisgarh, have been placed at your disposal. Your promised forecast (paragraph 25) of the requirements of the coming year, and your report (paragraph 27) on the suspensions and remissions of land revenue will be awaited. Table B. shows that in nine districts, of a total kharif demand of Rs. 16,73,933 on account of land revenue, the sum of Rs. 8,95,927 has been suspended, and a further sum of Rs. 1,47,812 remitted.

5. It is observed that, taking the Provinces as a whole, you do not anticipate a deficiency in food supplies, though in parts of Mandla (paragraph 7), Balaghat (paragraph 11), and Chhindwara (paragraph 16), where local scarcity is anticipated and where transport is very difficult during the rains, you think that Government help in some shape may be needed to secure a due supply of food grains. You have very properly directed the attention of the Divisional Commissioners to the correspondence†

* Telegram No. 845A., dated 19th February 1897.

† Circular No 4—21-1 F., dated 6th January 1897.

regarding the import of grain into Bengal, which was forwarded to local governments and administrations for guidance. Copy of subsequent correspondence on the same question is forwarded to you with this letter for information.

6. It is gathered from your letter that the districts in which the situation gives cause for greatest anxiety are—Damoh, where the *rabí* crop is very indifferent, and where distress has developed faster than was anticipated; Mandla and Balaghat, where the large aboriginal population and the scarcity of food stocks make relief administration exceptionally difficult; and Betul and Raipur, where in parts the relief organisation is considered by you to be in a less forward state than might be desired. The Government of India infer from the instructions given to the Commissioner of the Chhattisgarh Division in Mr. Priest's letter, No. 560, dated 30th January 1897, regarding the organisation of famine relief measures in the Raipur District, that you entertain grave apprehensions that relief is being insufficiently administered, and that distress may reach very serious dimensions. I am to request that the reports of the Commissioner and the Deputy Commissioner referred to in Mr. Priest's letter may be submitted, and to say that the Government of India will be glad to have further information as to the state of the district, and to be reassured that relief has now been organised on a scale commensurate with the necessity.

7. As your report is not concerned with the progress of events since the end of September 1896, which is the point reached in your Resolution No. 574, dated 1st February 1897, it necessarily does not touch on the mortality of the months subsequent to September, or on the steps taken in each district to ascertain the existence of distress, or on the gradual expansion of the relief measures in order of time. These subjects, it is understood, you are reserving for separate treatment. Meanwhile the Government of India are glad to observe, in the mortuary returns for November, published in the Local Gazette of the 20th February, a considerable improvement on the death-rate for the preceding month.

8. I am to convey to you the assurance of the fullest sympathy of the Government of India with you and with your officers in your and their arduous labours and anxieties, and in the exceptional difficulties and responsibilities of the situation.

I have, &c.
T. W. HOLDERNESS,
Deputy Secretary to the Goverment of India.

No. 841, dated Nágpur, the 11th February 1897.

From H. H. PRIEST, Esq., I.S.C., Chief Secretary to the Chief Commissioner, Central Provinces, to the SECRETARY TO THE GOVERNMENT OF INDIA, Revenue and Agricultural Department.

Sir,

I am directed to submit, for the consideration of the Government of India, a note by the Chief Engineer on the use of piece-work for famine relief purposes. It will be seen that Mr. Oliver suggests that, in view of the extreme difficulty of enforcing an adequate task on the ordinary relief-works carried out under the rules of the Famine Code, and of providing the necessary establishment for the detailed supervision of such works, both economy and efficiency in the administration of relief would be secured by the introduction of a modified system of piece-work, under conditions set forth in the memorandum attached to the note.

2. Mr. Lyall understands that in the North-Western Provinces and Oudh similar proposals have been accepted for districts considered to be "under observation" and not acutely distressed. He presumes, therefore, that there would be no objection to the adoption of such a system in any relief-works which might be opened in such districts in these Provinces as Nagpur, Wardha, Chanda (north-east corner, in the Zamindari of Ambagarh Chauki, the only distressed part of this district), South Bhandara or Nimar. But the Chief Commissioner has now seen the working of relief-works over a much larger area of the Province, and has personally visited every distressed district except Balaghat, Bhandara, Raipur, and Bilaspur (all of which he

hopes to inspect during the coming month); and he has been strongly impressed (1) by the generally good and robust condition of the persons coming on the works, and (2) by the difficulty of securing anything approaching an adequate task from the workers. The most idle persons set the standard of general diligence, and the minimum wage is sufficient to afford a subsistence. Where a large proportion of the workers are persons not altogether dependent for their livelihood on the work, who look upon their wage mainly as a supplement to their other means (as there are strong reasons for thinking to be the case on many of the works in the Nerbudda valley), they are quite content to do only the minimum task required to earn the smallest wage given. Individual contumacy can be punished under the Famine Code by temporary fines; but it is extremely difficult to apply any such discipline to bodies of workers numbering thousands. I am to enclose a copy of a circular issued under the Chief Commissioner's orders with a view to secure the better exaction of tasks; but it will be seen that the instructions it conveys regarding fines for short work require great discretion in their application, and that it would not be safe to authorise any "officer in charge" to adopt them except under strict supervision and control by superior officers.

3. It is this supervision and control which forms the main difficulty in administering famine labour upon an extensive scale. We have not men of the necessary training and other qualifications to place in charge of the works, and such men are not to be improvised. The supply of them, now that famine relief operations have assumed great dimensions in nearly all parts of India, has been exhausted; and the choice for the future—for the present numbers of persons coming on relief-works, great as they are, will certainly grow still further—lies between devising some more automatic system of getting a reasonable amount of work done for the wages paid, or trusting to unqualified and (it is to be feared) frequently untrustworthy agency for the supervision of the workers.

4. It appears, therefore, to Mr. Lyall to be desirable to try, in parts of the Province which are not acutely distressed, and where the standard of physique among the workers is good, a system of piece-work upon the plan suggested by Mr. Oliver. Such parts would comprise some portions even of the most distressed districts, but the places where the system would be tried would be carefully chosen by the Deputy Commissioner under the supervision of the Commissioner; and no piece-work would be introduced, except as an optional system in accordance with the principles set forth in paragraph 132 of the Report of the Famine Commissioners, in parts of the country where the reduced condition of the labourers would render its application dangerous. Such a system would be particularly valuable on the *ghât* portions of the roads connecting the Plateau districts with the level country below them. The Government of India are aware that large portions of these Plateau districts, inhabited by aboriginal tribes who depend for food on the small millets of the kharif harvest, are among the most distressed portions of the Province. It is absolutely necessary to relieve these persons in the neighbourhood of their homes, and road work affords at once the only practicable mode of affording relief and the best precaution against future distress by opening out the country. Such work, however, in the difficult *ghâts* which have to be surmounted in passing from the lower level to the higher, can only be done with any economy by piece-work, and to some extent only by skilled labour. An absolute prohibition of contract work in such cases would mean that the work could not be done except at an enormous cost, and the road work above and below the *ghât*, which forms the only possible employment of labour, would remain useless owing to the obstacle to traffic presented by the *ghât*.

5. The Chief Commissioner trusts, therefore, that the Government of India will authorise him to adopt the system of piece-work suggested in the Chief Engineer's note in cases where it appears to be the best mode of employing famine labour and of securing an adequate return for the wages paid.

I have, &c.
H. H. PRIEST,
Chief Secretary.

Famine Relief Works.

Note on the Introduction of Piece-work for Famine Relief, by E. E. Oliver, Esq.' M. Inst. C. E., Chief Engineer, Central Provinces, dated the 22nd January 1897.

The Chief Commissioner has lately had under consideration the management of relief works to be conducted by the agency of the Public Works Department, under the provisions of the Famine Code, and a series of rules and orders for the guidance of officers employed on these works has just been issued at this office G. O. No. C/498, dated the 26th December 1896.

Article 39 of the (C. P.) Famine Code divides these works into *ordinary* and *relief* works, and Article 7 lays down that the former may, on the first indication of the distress, be opened as test works, the primary condition of which is the offer of employment to the needy, with the stipulation that the labour shall be paid for strictly as task work.

The Government of India in their Circular No. 3–F./77–I. of the 24th December 1896 have drawn attention to the necessity of exacting a full task at all stages of relief operations. This was at the outset impressed on all our officers, and we are again calling upon them to use their earnest endeavours to give effect to the order.

It is, however, admittedly very difficult to induce relief workers to perform a reasonable task. Even on earthwork it is not easy to do so; in the case of metal breaking or work on the *ghats*, which in these Provinces we have more to rely on, it is infinitely harder. In the earlier stages, before suitable gangs are got together or the people become accustomed to the kind of work, it would be impracticable to insist on what would ordinarily be a reasonable task—in fact, judged by Public Works standard, a very light task. The people, moreover, are prone to start with the idea that the State intends to give them a wage sufficient to ensure against the pinch of hunger, and in many cases they prefer to shirk the task and trust to the minimum wage.

This minimum wage has been a good deal referred to in the public papers as something barely sufficient to keep the recipients alive. Now, although $1\frac{1}{2}$ annas—the D. wage—with ordinary grain selling at $9\frac{1}{2}$ seers per rupee, may seem small for the individual, it often means for the family more than they can earn in ordinary seasons. Thus take the D. wage at present prices for :—

	A.	P.
An adult male	1	6
„ female	1	3
One child over 12	1	0
Two over 7	1	0
Say two dependants	2	6
Should the woman have a child in arms add	0	3
Annas	7	6

This is nothing uncommon, and 4 to 5 annas per day for a family is certainly common. From a great many "charges" comes the same report that the people are content with the minimum wage while shirking the minimum task.

It may be said that, where this short work is due to wilfulness or contumacy, the case can be met by the infliction of fines under sections 61 and 62 of the Famine Code, and this is provided for under section 30 of the rules lately drawn up, but penalties of the kind can only be inflicted with care and judgment and cannot safely be left to the discretion of subordinates. Fines could no doubt be enforced by the District Engineer, the Deputy Commissioner, or some thoroughly responsible officer, the workers being first duly warned, if one of these officers could personally investigate the merits of the case, but even then it would probably be found necessary to exempt the women, the children, and some of the more feeble persons who might otherwise be driven off the works. As a matter of fact, however, it is seldom practicable for these responsible officers to personally deal with the many cases of short work that everywhere arise, and though we are issuing some experimental orders, the infliction of fines, that shall not press too hardly and still be effective, is a task of greater difficulty to the officers in charge than any demand they make on the labourers.

Experience has shown, both in the North-West and these Provinces, that more effective results are obtained by operations carried out on a system of piece-work, intermediate between the *ordinary* and the more strictly *relief* work of the Famine

Code; and, further, that under proper regulations, such a system may satisfy all the requirements of a tract of country not acutely distressed, or as supplementary to the large relief works, even where distress has been actually declared. The results would not be merely "more effective" as regards the obtaining a better outturn of work done for money expended; but, save perhaps in the case of the more weakly ones, would be very often more acceptable to the workers themselves. Piece-work allows them to work at their own time, with their own gangs, does not necessitate all their women and children coming daily to the works, encourages a spirit of industry and independence, occasionally enables the workers to earn a little more, and, as many think, ensures more of the money spent finding its way to those for whom it is intended.

The suitability of such a system of piece-work was very distinctly set forth in the report of the Indian Famine Commission, Part I., paragraph 132, where the desirability of having at least optional piece-work is demonstrated. Two objections have been raised:—

(1.) *That it is not well suited to the more weakly.* For many of these relief must admittedly be either gratuitous or the task be merely a nominal one. In most of the districts of these Provinces, and on the bulk of the larger works made over to the Public Works Department, at least 90 per cent. of the people are perfectly fit to do a reasonable day's work, and such a day's work ought, in justice, to be insisted on. A light task and sufficient food will soon raise the remaining 10 per cent. to a similar standard. For the few who continue weakly, or are unsuitable for draft to the Public Works Department works, there remain the relief centres and the smaller works.

(2.) There is also the argument that *such a system may tend to push on work too quickly, possibly to the spending money on a vigorous construction of public works rather than confining the expenditure to the mere saving of life.* There is no good reason, however, why such should be the case, for it is not necessary to give out more funds for piece-work than required for expenditure on other forms of management, and the rate can be so regulated that it will only be accepted by those impelled by want. Looked at from the economical side, there is no question as to the advantage; a liberal rate goes direct to the workers, and the vast establishment that now comes between them and the treasury is enormously reduced.

In some districts of these Provinces, where it is very necessary to open relief works, where owing to the nature of the country large earthworks or large relief camps are equally impracticable, and where detailed supervision cannot well be given, piece-work seems the most hopeful form such relief can take. For example, in the hilly tracts of Balaghat, Mandla, parts of Chhindwara and Narsinghpur, &c., where the need for relief work is reported as urgent, where suitable employment can only be given on *ghat* roads, and where the construction of such roads will be of lasting value, the ordinary rules, either of the Famine Code or as laid down in the Public Works General Order, are unsuitable, and some modification must of necessity be made to suit the local conditions.

It is not possible on all these *ghat* roads to do without a certain amount of skilled labour, and it must not be forgotten that the present price of grain, combined with the stoppage of ordinary public works, is telling very hardly on the skilled labour, but there is a great deal in the way of jungle clearing, short embankments and cuttings, getting and carrying of stone, &c., on which unskilled labour can be usefully employed, and which, for the hill tribes, is more suitable than either earthwork or breaking metal.

Again, in the case of the more distant villages for which small relief works only are required, the establishment of such works would be greatly facilitated if a certain amount of piece-work could be given out.

I have attached to this note certain conditions that might be useful in the giving out of piece-work, based in part on similar orders issued in the North-Western Provinces, and suggestions made by Mr. Fraser, the Commissioner of Nagpur.

Conditions to be observed in giving out Piece-work.

Care must be taken in the selection of suitable men for piece-workers or gangers. Petty contractors, relatives of district officials, chaprassies, and men of such classes, should not be employed. Village headmen, or those accustomed to work themselves, would be suitable, and the gang should be encouraged to elect a headman or ganger of their own.

In any case the ganger must himself reside on the work, deal directly with the workers, and be prepared to divide a fixed portion of the rate paid with them. In giving out the work, this proportion should be specified and the workers informed of it.

All the unskilled labour must be obtained locally or be posted to the work by the Deputy Commissioner. If, in the opinion of the latter, or of the Sub-Divisional Engineer, it is necessary, the ganger must undertake to pay wages daily or twice a week as may be arranged by the Public Works "work agent," and no member of the gang shall receive a less wage than the famine rate prevailing at the time.

The gangers must make all the water supply and sanitary arrangements required by the "work agent" or medical officer in charge, and, where necessary, arrange for suitable hutting or shelter for the workers, which will be paid for in addition to the rate.

The gangers must submit to any check and inspection in regard to the treatment of workers which the Deputy Commissioner or the Public Works "work agent" may consider necessary to secure the fulfilment of these conditions.

Tools, such as *phaoras*, picks, stone-breaking hammers, &c., will be supplied by the Public Works Department, baskets and perishable stores by the ganger.

In view of the high price of food prevailing, and the condition in regard to the employment of all workers posted to the works, the ordinary Public Works Department rates may be enhanced by 25 per cent. or, in particular cases to be referred to the Divisional Engineer, up to 50 per cent., which is to include the finishing up and handing over of the work up to the usual Public Works Department standard.

A gang employed under this system should not consist of more than 200 workers, nor should a ganger be allowed to execute work to the value of more than Rs. 1,000 per month. On the other hand, a man who cannot carry out work up to the value of Rs. 200 per month should be discharged.

A sub-overseer or "work agent" with the assistance of a *Moharrir* will, as a rule, suffice for the charge of piece-work of this kind. The gang register will not be necessary, but Field Account Forms Nos. 3, 4, and 5 of the rules above referred to must be kept up, progress returns being submitted to both district and Public Works Department officers as relief works. For all other accounts the ordinary Public Works procedure would be followed, the heading "Famine Relief Accounts" being added.

Piece-work of this class would be additional to the four charges fixed for each district under section 5 of the rules for relief works. Parts I., VI., and IX. to XIV. of the rules inclusive would apply as they stand.

E. E. OLIVER.

January 22nd, 1897.

No. 70–715, dated Nagpur, the 1st February 1897.

From E. E. OLIVER, Esq., M. Inst. C. E., Secretary to the Chief Commissioner, Central Provinces, Public Works Department, to the SUPERINTENDENT OF WORKS, all EXECUTIVE ENGINEERS OF DIVISIONS AND SUB-DIVISIONAL OFFICERS, Central Provinces.

Famine Relief Works.

I am directed to forward copy of Circular No. 3–F.–77–I., dated the 24th December 1896, from the Government of India, drawing attention to the importance of exacting a full task at all stages of relief operations, and to impress upon you the absolute necessity of a steady endeavour to enforce the execution of such task.

2. It has appeared to the Chief Commissioner in some cases that it has been too lightly assumed that the exaction of a full tale of work for the wages paid is impracticable, and that officers have failed to make that earnest effort without which any high standard of economy is impossible. There is no reason, Mr. Lyall considers, why by the exercise of tact and patience a reasonable task, adjusted to the capacity of all workers, should not be insisted on. Any undue leniency in the case of persons not performing a full task is apt to set a very bad example to those workers who have previously done such a task, and discipline becomes impossible if any set of workers are favoured in this respect above others. Special attention is invited to Article 61 of the Famine Code, which empowers the *temporary* infliction of fines below the minimum

wage in case of contumacy; Article 62, which explains that fines are not to be inflicted for short work due to weakness; and Article 83, which explains what the penal ration is. It will be seen that by Article 80 (*c*) the officer in charge has to report weekly his action in the case of any failure to accomplish a full task. I am also to draw attention to paragraph 30 of the rules of General Order No. C.-498, dated the 26th December 1896, which deals with this matter.

3. I am also to forward, for information and as suggestions, correspondence in regard to the task work required from workers at Lakhnadon in the Seoni District, and the measures which have been authorised *experimentally* by the Commissioner at that place for dealing with short work. If you find it necessary to take any such action in the works in your $\frac{\text{division}}{\text{district}}$, you should do so in consultation with the Deputy Commissioner, and the result should be carefully watched and reported for the Chief Commissioner's information, with a full account of the action taken.

No. C.-14, dated Seoni, the 19th January 1897.

From F. C. ANDERSON, Esq., I.C.S., Commissioner, Jubbulpore Division, to the DEPUTY COMMISSIONER, Seoni.

I have the honour to forward a memorandum which I have drawn up on the subject of the experimental introduction of fines for wilful short work on the Public Works Department relief work near Lakhnadon, and to request that the result of the experiment may be reported in due course. It should be specially stated whether it drives any needy labourers off the work. In that case you can reduce the half task; but I believe that the half task can easily be done by reasonable industry.

No. C.-15, dated Seoni, the 19th January 1897.

Copy, with copy of memorandum, forwarded to the Chief Engineer, Central Provinces, for information.

F. C. ANDERSON,
Commissioner.

Memorandum dated the 15th January 1897, by F. C. Anderson, Esq., I.C.S., Commissioner, Jubbulpore Division, regarding the Public Works Department Relief Work (stone breaking) near Lakhnadon.

It has been found by experience that the relief workers do not attempt to perform a reasonable task. They expect to get a minimum wage for doing as little as they can, and are content to idle and receive that wage at the end of the day. There can be no discipline under such a state of affairs, and it is necessary to apply paragraphs 61 and 62 of the Famine Code in order to correct it. These provisions of the Code authorise the infliction of fines so as to reduce the wages below the minimum wage temporarily in cases of contumacy and wilful short work. I have consulted the executive engineer, Plateau Division, and the Deputy Commissioner as to what is a fair task on this work, and the following is fixed as such for a gang composed as shown below:—

	Cubic Feet.
20 men at 3 cubic feet per head - - -	60
50 women at two cubic feet per head - - -	100
10 children over 12 years at one cubic foot per head -	10
10 children under 12 years, carriers - - -	Nil.
90	170

It is considered that a gang of the class of labourers employed on this relief work (most of them being able bodied) can perform this task with reasonable industry, and if they perform it, they will earn the B. wage. It is also considered that if they perform less than one-half of it, they should be treated as having wilfully done short work deserving fine. It is necessary to ascertain experimentally what the effect of fine will

be, and the Deputy Commissioner is therefore authorised to warn the workers in each gang that unless they perform a task of 85 cubic feet, the men and women will be fined as follows :—

—	Present Wage	Wage after deduction of Fine.
	A. P.	
Men	1 3	9 pies.
Women	1 0	9 „

No fines will be inflicted on the children, nor will fines be imposed in the case of any gang which has been on the work for less than eight days. Five or six gangs may be at first selected and given two days' warning; if they fail to perform half the task on the third day, they will be fined. Five or six more gangs may then be selected and similarly warned and dealt with. Mr. Higgins will be at Lakhnadon, and he and the Sub-Divisional Officer should carry out these orders, reporting the result. They are issued experimentally, and may be modified by you in regard to the half task if that should be found excessive so as to drive needy labourers off the work.

No. 1269, dated Nagpur, the 27th February 1897.

From H. H. PRIEST, Esq., I.C.S., Chief Secretary to the Chief Commissioner, Central Provinces, to the SECRETARY TO THE GOVERNMENT OF INDIA, Department of Revenue and Agriculture.

With reference to the Chief Commissioner's telegram of the 8th February, asking for an additional grant of three lakhs of rupees for agricultural loans during the current year, I am directed to forward, for the information of the Government of India, copy of a letter No. 1027, dated 3rd February 1897, from the Commissioner, Nagpur Division, with its enclosures, containing an application by that officer for an immediate grant of Rs. 1,40,000 for the purchase of seed-grain in the Balaghat District. I am also to forward copy of Revenue Department No. 876, dated 13th February 1897, sanctioning this allotment. Since dealing with this matter the Chief Commissioner has visited Balaghat, and, after careful discussion with the local officers, is of opinion that the immediate requirements for seed-grain, especially in the ryotwari tracts where Government stands in the position of malguzar, have, if anything, been under-estimated, and he considers that a further grant of Rs. 20,000 to Rs. 25,000 will probably be found necessary.

2. As regards the balance of Rs. 1,60,000 which has not yet been allotted by the Chief Commissioner, I am to attach copy extract from Revenue Department letter No. 560, dated 30th January 1897, to the address of the Commissioner, Chhattisgarh Division, dealing with a representation by the Deputy Commissioner, Raipur, that an immediate grant of two lakhs of rupees was necessary for the purchase of seed-grain in that district. Although Mr. Lyall saw no sufficient grounds for sanctioning this sum on the inadequate data then before him, he was prepared to find that the Deputy Commissioner of Raipur would be able, after further inquiry and consideration, to make out a case similar to that made out for Balaghat, and that it would then be necessary to make the allotment asked for before the end of the current financial year. From the further information which has recently reached him regarding the circumstances of the Raipur District, the Chief Commissioner considers it indeed very probable that such a case may be made out.

3. As regards the precautions adopted to prevent the immediate consumption for food by grantees of money advanced for the purchase of seed-grain, I am to observe that for ryotwari tracts the seed will be purchased by Government and stored until it is needed for seed later on. In other cases, the Malguzars must be relied on in view of their own very strong interest in keeping their tenants together to devote the money granted to them to the purchase of seed for their cultivators. In previous similar cases it has been found that they can, with few exceptions, be trusted to do this, and no further precaution suggests itself to the Chief Commissioner for effecting this end.

No. 1027, dated the 3rd February 1897.

From the COMMISSIONER, NAGPUR DIVISION, to the CHIEF SECRETARY TO THE CHIEF COMMISSIONER, CENTRAL PROVINCES, REVENUE DEPARTMENT.

I have the honour to forward copy of a letter No. 428, dated 25th ultimo, from the Deputy Commissioner, Balaghat, regarding the supply of seed for the kharif sowings in that district. In the course of my tour through Balaghat, I noticed the exhaustion of stocks. The urgency of the matter consists in this—that, if the present limited stocks are consumed, there may be insuperable difficulty in the way of procuring suitable seed, especially for the Behir Tahsil.

2. I discussed the matter fully with the Deputy Commissioner, Mr. Chitnavis, on his return from leave. I asked him, after giving the matter such consideration as was possible, to submit his views. The question is one which is surrounded with difficulties. These we discussed together; and the Deputy Commissioner's present letter is the result of that discussion. I agree generally in the views set forth by the Deputy Commissioner. The separate treatment of the question for malguzari and ryotwari villages seems necessary, and is in accordance with conclusions at which I had myself arrived.

3. Even in the more open parts of the Balaghat District, *i.e.*, in the Balaghat Tahsil, and even in the malguzari area where there is *primâ facie* good security for money, it will be very difficult indeed, I fear, for malguzars and tenants to obtain all the seed-grain they need. There are not many capitalists and mahajans to lend money or seed even in these tracts. A great deal of the advancing of seed has hitherto been done by the malguzars themselves. No doubt the "mahajans" and money-lenders who have hitherto advanced seed will be inclined to advance again this year so as to prevent their former advances from being irrecoverably lost. But, as I say, this only represents a small part of the business of seed advancing as usually carried on. And it represents a much smaller part of what will be necessary this year.

4. In the same way, malguzars will no doubt be found willing to advance seed to their tenants, not only to keep the land under cultivation, but also to enable them, as far as possible, to recover the advances made in vain last year, and in some cases for more than one year. But the malguzars themselves will have difficulty this year. They will have to buy seed. It will be necessary, therefore, to make large advances under the Agriculturists' Loans Act, 1884. The advances will have to be made soon so as to enable them to buy seed. I think also that they should be made to malguzars only, on condition that they distribute the seed among their tenants. This condition would be enforced by the immediate issue of severe coercive processes in realisation of the money if it was found to be misapplied.

5. In the ryotwari area the case is different. The facilities for the purchase of seed in Behir are much less than they are in the Balaghat Tahsil, and I doubt whether seed from Balaghat, Bhandara or Chhattisgarh would be found suitable in Behir. On this account, the case of Behir calls for exceptional treatment. But the necessity for exceptional treatment becomes much more apparent, when it is remembered that in the ryotwari area Government is itself the malguzar. The tenants have no one to look to in respect to seed unless Government comes to their assistance.

6. It seems to me that Government must arrange to supply the ryots, not with money, but with seed, and it must purchase this seed at once, or it will not be available. Men can eat imported grain; but, as I have said, it is doubtful whether they can with advantage sow imported seed. This year the lack of rice in Behir is unprecedented, and it is probable that no amount of money advanced under the Agriculturists' Loans Act will enable the tenants to sow their fields, unless the existing stocks are bought up at once. The impoverished and improvident tenants will not keep their grain for seed. They will eat it, I think; therefore that Government should buy up what grain there is in this land-locked tahsil, and store it for seed, leaving present necessities to be met by importation to the relief works. The Deputy Commissioner proposes to work this plan with the assistance of merchants from whom he will take good security. One of these merchants (Har Krishan Sao) is already assisting him in supplying grain for the relief works in Behir.

7. I support the Deputy Commissioner's proposals. * He estimates that advances, amounting to Rs. 1,40,000, will be required to meet the case of both the malguzari and ryotwari areas. I am bound to say that I think his estimate of cost of seed rather under the mark. Rupees 2 and Rs. 2–8 per acre are low figures to take for Balaghat and Behir, respectively, at the present rates for grain which are rising. It may be,

however, that less help will be required in the Balaghat Tahsil than the Deputy Commissioner anticipates. I am, in any case, disinclined to estimate for less than one lakh and a quarter. I would accept the Deputy Commissioner's figures. I have said enough to show the necessity for early orders.

No. 428, dated the 28th January 1897.

From the DEPUTY COMMISSIONER, BALAGHAT, to the COMMISSIONER, NAGPUR DIVISION.

In compliance with your letter No. C. 26, dated the 13th current, I have the honour to report as follows on the matter of seed-grain advances, and in this respect I would deal with the malguzari and ryotwari areas separately.

2. In nearly every village the year opened with so great a dearth of grain that some land was left unsown for want of seed, and there is no old grain now left in stock, except in perhaps a dozen villages. The malguzars have been unable to recover the advances made by them, and although their home farms have not suffered so disastrously as the tenancy area has, yet few of them have escaped with even moderate loss. The produce of their fields is barely sufficient for their own requirements. They have had, with few exceptions, either to borrow from money-lenders or obtain taccavi from Government, and both malguzars and tenants have equally lost credit. They are unable to obtain loans even at ruinous rates of interest, and unless substantially helped by Government will be totally unable to sow their lands in June. A liberal provision of taccavi is needed for the purpose, and to be of any use the loans must be given next month at the latest, as this year's produce is already been consumed, and after a month prices will rise considerably and grain will be procurable with great difficulty. The total area under rice in the malguzari area has been estimated to be 205,430 acres, and that under kodon and kutki 33,760 acres; total 239,190. For half of this seed will be procured by the malguzars and rich tenants without help from Government. No loans are required in the Bhadra zemindari, where the zemindar has promised to see the lands of his ryots sown. The other zemindars, with the exception of Mahipat Rao of Hutta, are bankrupt, and he, though free from debt, has no stock of grain nor money wherewith to purchase so large a quantity as would be required. Seed will thus have to be provided for at least 90,000 acres, the cost of which at Rs. 2 an acre would be Rs. 1,80,000. I would therefore ask you for an allotment of at least Rs. 1,00,000 for the said area. With a lesser allotment, nearly 30 per cent. of the cropped area will remain unsown.

It would be useless to give money to starving people and to expect them to buy grain and to keep it till seed time. I would therefore give loans to malguzars only and hold them responsible for the purchase of grain and its distribution among the tenants at seed time. The Land Record and Revenue staffs would be responsible for bringing to notice any misapplication of the money, and the fear of immediate recovery by coercive processes of the misspent amount would, I think, be a sufficient check on, and considerably minimize misapplication.

3. The case of the ryotwari area is different. There Government holds the position of landlord. The people are very poor. Owing to the last year's deficient harvest a very large amount of taccavi, Rs. 10,000, was doled out in these villages. Still some of the recipients of the advances were not able to obtain seed grain in exchange for the money. This year the lack of rice in the Baihar Tahsil will be unprecedented. With the exception of two patels no old stocks have been left. No amount of money distributed will enable the tenants to sow their fields. The little harvest that has been gathered will be consumed in about a month or two. Moreover, the tenantry are so improvident and impoverished that they will keep very little or nothing for seed purposes. The total area cropped under rice and kodo is in that tract 26,380 acres, the value of the seed required for which would be Rs. 65,950, at Rs. 2–8 an acre. About 11,000 acres out of the above would probably be sown without aid from Government, and for the rest provision will have to be made by Government. The amount required for the purpose would be Rs. 40,950, or Rs. 40,000 in round numbers. I would ask for an allotment to that extent for the ryotwari area.

4. The bulk of the seed required will have to be imported. I do not think that by any possibility more than Rs. 20,000 worth of rice can be purchased either in Baihar or the tracts round it, and the rest will have to be brought in from outside. Unless

this is done the land will remain fallow and another famine will follow next year. Private enterprise cannot be depended upon to get the land sown in June next. There are only a handful of poor Banias in the tract, and they cannot be expected to provide the seed. Whatever grain there is in the Baihar Tahsil can be brought in within the next month with tact, management, and dint of great energy, and the balance imported from the Bhandara district. Harkis and Sao of Balaghat and Balai Misar of Baihar are willing to assist me in the matter. I would advance them money for the purpose on adequate security, and have the requisite quantity of grain brought in and stored at convenient centres. Advances would be made to the ryots in grain. There is risk of loss of money in this, but it must be faced.

No. 876.

From the CHIEF SECRETARY TO THE CHIEF COMMISSIONER, CENTRAL PROVINCES, to the COMMISSIONER, NAGPUR DIVISION.

I am directed to acknowledge the receipt of your letter No. 1027, dated the 3rd instant, forwarding copy of a letter, No. 428, dated the 25th ultimo, from the Deputy Commissioner, Balaghat, and, under the circumstances therein represented, to convey the sanction of the Chief Commissioner to an advance of Rs. 1,40,000, *i.e.*, one lakh for the malguzari and Rs. 40,000 for ryotwari villages, under the Agriculturists' Loans Act, for the purchase of seed grain in the Balaghat district.

2. I am to add that the seed to be purchased for ryotwari tracts should be stored by Government until sowing time, otherwise there seems a strong probability that it would be consumed as food.

EXTRACT of a LETTER, No. 560, dated the 30th January 1897, from the CHIEF SECRETARY TO THE CHIEF COMMISSIONER, Central Provinces, Revenue Department, to the COMMISSIONER OF THE CHHATTISGARH DIVISION.

* * * * * * * *

In his seventh paragraph Mr. Lawrie discusses the question of agricultural loans for the purchase of seed and bullocks. He says that—

He is convinced that there is a real necessity for the grant of such loans on an extensive scale, and that this is the opinion of the most prudent and the best informed of the district officials as well as of landowners and cultivators.

Mr. Ganga Singh is of opinion that if Government does not grant money on loan under this head a considerable portion of the kharif area will remain unsown, and the distress will thus be prolonged into the ensuing year. Mr. Lawrie adds that "it is "imperative that money should be provided at once for loans, as now is the time to "buy," and he asks for a sum of two lakhs, to be given immediately in loans without interest for this purpose; and he concludes:—

If action is taken in this direction and contractors engaged to supply grain, there will be a considerable saving in the way of gratuitous relief, and confidence will be restored in the district.

All these statements are in the nature of assertions, and not of argument. The arguments against the Government undertaking the general supply of seed grain are stated in paragraph 10 of the notes of the Raipur Conference of the 21st November last, and Mr. Lyall does not perceive in what Mr. Lawrie writes a single argument on the other side. It may at once be conceded that if Government were to pay, in loans without interest, or even at the usual low rate of interest, for the supply of the seed required for the next rice harvest, the cultivators would prefer to get their seed in this way to getting it on usual terms from the village bania; but this they would do even in ordinary years. What has to be shown is that they could not get the seed from the bania on any reasonable terms, and that the customs which have prevailed for centuries as to the source of the supply of seed would in the present emergency break down. The bania lives by means of the people who cultivate for him. He has to make his profit out of the crops harvested, and it is reasonable to suppose that he will secure the existence of a crop by which he can live. If there is no crop, his business fails as much as that of the cultivator himself. Mr. Ganga Singh should be asked to explain the grounds of his surmise that without seed advances the full kharif area will not be sown.

At present the statement is unsupported by evidence. If any exists it should be brought forward.

For these reasons the Chief Commissioner cannot sanction any large and general expenditure by Government on the supply of seed without much stronger evidence of its necessity than Mr. Lawrie adduces. He considers that the grant of loans under the Agriculturists' Loans Act should be limited to cases where it is clearly shown that without such assistance the cultivator cannot obtain his seed or plough bullocks on any reasonable and customary terms, and where the banias exhibit a tendency to hold out for exorbitant conditions. This will necessitate an inquiry into every applicant's case, and it will be impossible to deal with the matter wholesale. It may, of course, be expected that the necessity for such advances will be more general in a year of pressure than in an ordinary year; but the principle applied should be the same in both. The statement that immediate action is necessary apparently rests upon the assumption that prices are likely to rise materially as the hot weather goes on. In the preceding paragraph reasons have been mentioned why this seems somewhat improbable, and it is certain that any large expenditure on the purchase of rice for seed grain by Government would have the effect of driving prices up. The allotments for the kharif sowings will be made in the usual way after the 1st April next. In addition to the other reasons for deferring them to a date nearer the time of sowing, the Chief Commissioner fears that if made now they would be misapplied, and that the grain purchased would be eaten instead of sown.

No. $\frac{722}{110-2}$ F., dated Calcutta, the 3rd March 1897.

From T. W. HOLDERNESS, Esq., C.S., DEPUTY SECRETARY TO THE GOVERNMENT OF INDIA,
to the CHIEF COMMISSIONER OF THE CENTRAL PROVINCES.

SIR,

I AM directed to acknowledge the receipt of Mr. Priest's letter No. 841, dated 11th February 1897, submitting proposals for the substitution of a modified system of piece-work in certain areas for relief works on the task system prescribed by the provincial Famine Code.

2. You would try the experiment not only in parts of the Province which are not acutely distressed, but also in portions of acutely distressed districts where in the opinion of the Deputy Commissioner and Commissioner, the condition of the labourers is not so reduced as to make its application dangerous. You state that, having now visited most of the distressed districts, you are strongly impressed (1) by the generally good and robust condition of the persons coming on the works, and (2) by the difficulty of securing anything approaching an adequate task from the workers. You recommend the plan suggested by your Chief Engineer as the best mode in many cases of employing famine labour, and of securing an adequate return for the wages paid. And you also urge that the connecting portions of the roads now under construction by relief labour, between the low country and the plateau, must either be done by piece workers, or else omitted from the present famine relief programme.

3. Since Mr. Priest's letter was despatched, you will have seen from the circular letter,* and its enclosures, that the principles which underlie the relief works system,

* No. $\frac{16}{104-1}$ F., dated February 1897.

N.B.—This statement gives the *annual* death-rate per mill[illegible] which will be found for November and December 1895 in the Statement at p.

with its task-work and its provision of employment for all comers irrespective of their efficiency as workers, have been under the consideration of the Governor-General in Council, and that rules have been laid down to guide local Governments in determining when distress may be appropriately relieved by offering employment on the piece-work or petty contract system, and when nothing short of relief works under the strict letter of the Famine Code will meet the case. The Government of India think that these rules will enable you to decide for yourself the cases in which Mr. Oliver's proposals may be applied, and they do not wish to further fetter your discretion. On the other hand, the rules have been settled after very careful consideration, and it would be premature at present to revise them.

4. It appears to the Goverment of India that some such plan as that proposed by your Chief Engineer may be very properly tried in the first class of districts mentioned in Mr. Priest's letter, namely, districts in which distress is not acute. As regards the second class of districts, namely, those in which distress is acute, the decision would mainly turn on the point whether considerable numbers of the labourers seeking employment are inefficient or not. The labour of women and children is not, *ipso facto*, inefficient, but it is efficient only for certain classes of work. If the general condition of the relief workers is robust, and if the women and children are not in excessive numbers, the petty piece-work or intermediate system could probably be tried without danger under watchful supervision. If these conditions do not prevail, then piece-work would fail to provide employment and wages for the persons in greatest need of relief, and it would become dangerous.

5. The particular question of including the ghât portions of the roads in the relief work programme, and of executing them by piece labour, should be decided by you with reference to Rules 1 and 2 of the principles. If these sections of the roads lie in localities where the intermediate system is a suitable form of relief, and if on them relief workers can be suitably employed, there is no reason why they should not be taken up. If these conditions are not fulfilled, and if the only ground on which the immediate completion of the sections can be justified is that the rest of the roads will be otherwise of little use, the Government of India would be obliged to say that they should be excluded from the relief programme.

I have, &c.
T. W. HOLDERNESS,
Deputy Secretary to the Government of India.

No. $\frac{723}{110-2}$ F.

Copy of correspondence forwarded to the Public Works Department for information.

By order,
T. W. HOLDERNESS,
Deputy Secretary to the Government of India.

No. C.–386, dated Camp Jubbulpore, the 16th March 1897.

From H. H. PRIEST, Esq., I.C.S., Chief Secretary to the Chief Commissioner, Central Provinces, to the SECRETARY TO THE GOVERNMENT OF INDIA, Revenue and Agricultural Department, Calcutta.

I am directed to submit, for the information of the Government of India, consolidated monthly Famine Statements A. and B. as prescribed by section 16, IV.–VII. of the Central Provinces Famine Code for the month of February for all districts of the Central Provinces which are affected by scarcity.

A memorandum by the Commissioner of the division summarising the main facts in each of the affected districts is also forwarded for each division, as well as copy of a letter from the Commissioner, Nerbudda Division, which accompanied the memorandum for his division.

Maps coloured to show the affected areas are also forwarded for each district.

2. With reference to these reports and statements, I am to observe that relief measures in the Jubbulpore and Nerbudda Divisions are, the Chief Commissioner believes, now fully organised, the arrangements made there being fully adequate to meet any probable development of distress. In these divisions, it will be observed, the harvest operations have caused a substantial decrease of the numbers coming on Government for relief. This decrease is, however, likely to be temporary only, and much of the labour now engaged on harvesting will doubtless return to the relief works when the spring crops have been fully gathered in.

In the Nagpur Division there is, Mr. Lyall thinks, some cause for anxiety as regards the Balaghat District, where distress has recently been developing very rapidly, and where the Deputy Commissioner has been in weak health and unable to control the arrangements for famine relief with the necessary energy and attention. The Chief Commissioner has, on these grounds, found it necessary to transfer this officer to a lighter charge, and to replace him by an officer better fitted to stand the strain of responsibility for a heavy famine district.

The Chief Commissioner visited this district towards the end of February, and the whole situation there is now under his careful consideration.

3. In the two districts of the Chhattisgarh Division which are affected by scarcity (Raipur and Bilaspur) distress is, as was to be expected in tracts so largely dependent on one crop (rice), developing very rapidly now that the small outturn of the autumn harvest has been consumed. The circumstances of each district have recently been very fully considered by the Chief Commissioner on the spot in consultation with the local officers, and he trusts that the scheme of relief which has now been matured will prove adequate to meet any probable development of the situation there.

4. As regards details, it will be observed that the number of deaths reported to be due to privation in the Jubbulpore District for the month of January was large (2,708). These, however, include, it will be seen from the Commissioner's remarks, a large number of deaths of wanderers from Native States and from the North-Western Provinces. The Government of India are aware that the northern parts of this district have long been subject to the invasion of such famine-stricken persons from outside, and that the method of dealing with such immigration has been one of the chief difficulties of the situation there. According to the latest information received more energetic measures are now being taken in the Baghelkhand States for the relief of distress within their borders, and the Chief Commissioner hopes that the difficulties caused by immigration will decrease.

5. In paragraph 2 of your letter No. $\frac{749\ \text{F.}}{26\text{–}9}$, dated the 6th instant, a request was made that the result of the inquiry into starvation deaths in Bilaspur, referred to in paragraph 6 of the memorandum by the Commissioner, Chhattisgarh Division, forwarded with my letter No. 975, dated the 17th February 1897, should be submitted to the Government of India with the reports for this month. The inquiry is, however, I am to say, not yet complete, but the Commissioner of the Division has been asked to have it completed both for that and the following month as soon as possible. As soon as it is received it will be forwarded to the Government of India. The Commissioner, Chhattisgarh Division, has also been instructed to arrange for a more precise record of starvation deaths in the Raipur District.

Monthly Famine Statement A. for the Four Weeks ending Saturday Evening, the 27th February 1897.

Children and dependants who do no work should be shown in column 11 under "gratuitous relief." If they do any work they should be entered under Class D. (Column 9).

N.B.—Columns 15 and 16.—Any observations that it may be necessary to make respecting the extent to which increase in mortality is due indirectly or directly to famine should be included in the "Remarks" page appended to statement A.—*vide* overleaf.

If particulars to fill columns 15 and 16 cannot conveniently be submitted for the month under report in the first half of the month following, then these columns should be left blank and a separate mortality statement referring to the month previous to that dealt with in Statement A. should be submitted.

This statement will relate to the period between the last Saturday of the previous month and the last Saturday of the month under report.

Foot-note.— 8,101 persons employed on small works started from private funds in the Bhandara District.
15,955 persons employed on malguzaris tank works in the Balaghat District.
20,328 employed on local works started by Deputy Commissioner and by malguzars with the help of famine loans in the Raipur District.

* The Deputy Commissioner doubts the accuracy of this figure. It is being verified.

† In Jubbulpore all deaths, due to any kind of sickness, in poor-houses, or relief centres, are included.

Monthly Famine Statement B. for the Four Weeks ending 27th February 1897.

* Out of this amount 16 have been transferred to Famine Takavi. † Besides this 47 was spent in Pandaria Zamindari from the Estate Funds. ‡ District figures have not been reported yet.

(*a*) Some relief works will have been more or less exhausted since the last programme, and others will have been provided for entry in the next programme. The net result should be shown in columns 6 and 7.

(*b*) The submission of the report should not be delayed in order that accounts of expenditure may be made up to date of report.

(*c*) The total expenditure incurred and the advances made during the financial year previous to that to which the report and statements under submission belong should be stated in a foot-note.

This statement will relate to the period between the last Saturday of the previous month and the last Saturday of the month under report.

SUMMARY of the REMARKS in the DISTRICT REPORTS to accompany MONTHLY FAMINE STATEMENTS A. and B. (JUBBULPORE DIVISION) for February 1897.

1. *Private Relief.*—A public meeting at which the Commissioner presided was held in Jubbulpore on the 13th February for the purpose of electing gentlemen to represent the Jubbulpore Division on the Central Provinces Provincial Committee, Indian Famine Charitable Relief Fund. At this meeting the objects to which subscriptions raised in aid of this fund may be legitimately devoted were explained, and a District Committee was appointed for the Jubbulpore District. The Deputy Commissioners of other districts have been since asked by the Executive Committee of the Central Provinces Branch to arrange for the appointment of District Committees in their respective districts.

In the town of Jubbulpore the work (referred to in my summary for January) of relieving persons of the respectable classes from funds previously raised continues; so does the work carried on by the members of the Theosophical Society. In the Murwara Tahsil (Jubbulpore District) about one-half of a local charitable fund of Rs. 1,021 was devoted to clothing paupers.

In Saugor the subscriptions to the Famine Relief Fund now amount to Rs. 3,435 in all. The sum reported last month was Rs. 2,800.

In Mandla a portion of the Lyall Reception Fund is being devoted to the support of respectable persons who are unwilling to make their want public. Small works and children's kitchens have been opened and are maintained by the Church Mission Society at their Mission Stations in the interior of the district.

2. *Poor-house Relief.*—The following is a comparative statement of the number of the poor-houses in the division and of their population at the end of January and February respectively :—

District.	Number of Poor-houses.		Number of Inmates.	
	End of January.	End of February.	End of January.	End of February.
Jubbulpore	5	5	4,341	2,470
Saugor	5	5	3,182	3,701
Damoh	4	4	1,516	1,269
Mandla	2	2	290	404
Seoni	2	2	546	621
Total	18	18	9,875	8,465

The number of poor-houses remains unaltered.

The decrease of the population in Jubbulpore is partly due to the return to Rewah, by arrangement with the Political Agent, of paupers belonging to that State, and partly to the departure of recovered paupers to the harvesting. In the Saugor District the increase has occurred mainly in the poor-house at head-quarters.

The fluctuations in the three other districts are not very striking.

3. *Village Relief.*

(*a.*) *Relief Centres.*—The following is a statement of the number of relief centres open at the end of February with details of the relief afforded :—

District.	Number of Centres.	Number of Persons.	
		Relieved gratuitously.	Employed on Works at the Centres.
Jubbulpore	19	2,919	16,610
Saugor	8	504	90
Damoh	1	Not stated.	Not stated.
Mandla	17	653	3,283
Seoni	8	340	1,042
Total	53	4,416	21,025

Four new centres, with local works attached, were opened as a temporary arrangement in the Murwara Tahsil of the Jubbulpore District in order to meet a rush of applicants for relief who could not be provided for at once on the existing Public Works Department relief works. At other centres drafts were made to the nearest Public Works Department relief work. Transfers have also been made from the relief centres to the village relief lists. The general result is that the numbers gratuitously relieved at relief centres in this district have fallen during the month of February from 3,286 (the January figure) to 2,919, and the numbers employed on work thereat from 30,353 to 16,610.

In Saugor the number of relief centres is the same; the number relieved at them has declined.

In Damoh Abhana appears to be the only place corresponding to the relief centre in other districts, *i.e.*, a centre managed by a local committee. Local works carried out by the Deputy Commissioner with a paid officer in charge render separate relief centres unnecessary in this district.

In Seoni a new centre has been opened at Korai on the Seoni-Nagpur road, which is much frequented by travellers.

In Mandla the number of centres remains unaltered, but the numbers relieved at them have increased very considerably.

(*b.*) *Relief of the People in their Homes.*—The Deputy Commissioner of Jubbulpore writes that there are, it is believed, very few villages of his district to which this class of relief has not been extended, and that the village relief arrangements generally are now adequate. It has been found necessary to add largely to the numbers on the original registers. The number shown as relieved in their homes in the Jubbulpore district, according to the latest return, is 13,103, but the correctness of the figure is doubtful. It appears to be too high.

In the summary for January I stated that the best progress in extending this form of relief had been made in the Saugor district, but subsequent information showed that this was only true in regard to the Khurari and Saugor Tahsils, the arrangements in the Banda and Rehli Tahsils being backward. By this time, however, village relief has, the Deputy Commissioner reports, been extended to all parts of the district, with the exception of a few villages in the two last-named tahsils. The number returned as relieved at the close of February is 5,716 against 6,656 at the close of January. Why the number should have decreased is not apparent. It has recently been found necessary by inspecting officers to add to the lists, and persons who are now inmates of the poor-houses will in some cases come hereafter on the village relief lists.

In the Damoh District the number of persons relieved in their homes is estimated at 5,000. Village to village relief, the Deputy Commissioner writes, is now progressing under a regular system of inspection. In another report he states that some cases of misappropriation by those entrusted with the distribution of funds have been discovered. I was recently on tour for a few days in the south of the district, and in the villages in which I made inquiry the paupers on the list stated, without exception, that they received their money dole regularly from the Mukaddam. I did not find any case on the registers which should not have been brought on them, but in some cases names had been omitted of persons entitled to relief. The arrangement made in Damoh is that they should be paid so much daily (*e.g.*, 5 pice a day for a man) and not given a weekly or larger allowance by the Mukaddam. The payment of a daily rate is a protection against mistake or fraud, and has been adopted in the Jubbulpore District also.

The organisation of village relief was a matter of special difficulty in Mandla, but it has been completed by final check of the original lists. The number on the village registers is only 670 as against 1,326 entered in the original lists. The Deputy Commissioner says:—

"In this connexion the very important factor that 550 are being relieved gratuitously at relief centres should not be forgotten. They went to the centres before village relief was fully organised, and, I think, are much happier there with their able-bodied relatives working than they would have been all alone by themselves at home. The officials have been told to grant the relief in a liberal spirit, and I am issuing orders now to offer to those who are being gratuitously relieved at relief centres the option of returning to their villages and being relieved there. Every facility will be offered to those who choose to go back."

The Deputy Commissioner of Seoni reports that village relief was brought into operation during the month, that he has examined its working in both tahsils of the district, and that the result is satisfactory.

4. *General Character of Relief Work*—(*a.*) *Public Works Department Relief Works.*—The numbers on these works at the end of January and February respectively are shown below:—

District.	Workers.		Dependants.	
	End of January.	End of February.	End of January.	End of February.
Jubbulpore	25,727	22,793	5,739	5,162
Saugor	24,222	23,706	2,286	3,643
Damoh	7,364	6,076	427	1,314
Mandla	12,224	15,949	793	4,574
Seoni	3,304	4,284	382	1,059
Total	72,841	72,808	9,627	15,752

In the Jubbulpore District the number of workers exceeded 31,000 on the 6th February, but has since declined owing to the commencement of harvest operations. There has been a similar increase during and a decline towards the end of the month in the other districts. The large increase of dependants in Mandla is due to previous incorrect classification.

Arrangements have been made for establishing a third subdivision in Jubbulpore, and a second in Saugor. In the former district six new "charges" have been opened, viz., one on the Great Northern road, three on the Mirzapur road, at Jhinjri, Teori, and Chaka, one on the Murwara-Barhi road, and one on the Chaka-Bijoraghogarh road. The main object was to provide for the increasing number of applicants for work in the Murwara Tahsil. In the Saugor district three new charges have been opened, viz., a second charge on the Saugor-Rahatgarh road, a second charge on the Saugor-Cawnpur road and a charge on the Khimlasa, Besahri-Etawa road.

In Damoh the number of charges, viz., 4, remains unaltered. In Seoni a new charge has been opened on the Seoni-Balaghat road, making three charges in this district.

In Mandla the number of charges, viz., 4, is the same, but proposals for opening additional charges are under consideration. Cholera broke out in the Shahpura and Tikaria relief camps in this district. Most of the Shahpura workers went to the Chabi relief work on the Mandla-Dindori Road.

The attack of cholera at Tikaria subsided, and numbers, which had fallen, began to rise again.

(*b.*) *Local Works under the District Officer.*—The numbers employed (excluding dependants) at the end of January and February respectively are shown below:—

District.	End of January.	End of February.
Jubbulpore	28,683	15,160
Saugor	425	108
Damoh	11,559	8,485
Mandla	1,004	1,068
Seoni	838	1,170
Total	42,509	25,991

The Jubbulpore figure for February includes about 6,000 persons employed on the Jubbulpore Municipality. The decrease of numbers in this district and in Damoh is due to the counter attraction of harvest operations. The rabi harvest is unusually early this year. In Saugor a tank has been begun by the Court of Wards (Dhana Estate) in the village of Phuller. The local works in Mandla are for the reception of recovered paupers from the poor-houses. Those in Seoni consist chiefly of minor improvements in ryotwari villages.

(*c.*) *Famine Loan Works.*—In Jubbulpore loans aggregating Rs. 41,875 have been sanctioned, of which Rs. 11,344 were paid out during the month under report. The

works are only now being started. No loans have as yet been granted in Saugor and Damoh. In Mandla Rs. 1,900 have been loaned to two Malguzars. In Seoni Rs. 4,780 have been paid out. Jubbulpore and Seoni are the only two districts in which any readiness to take up these loans has hitherto been displayed.

5. *Physical Condition of the People.*—The Deputy Commissioner of Jubbulpore writes as follows :—

"During the month I made a short tour in the Sehora Tahsil, and a longer one in the Murwara Tahsil, seeing altogether 11 works and nine relief centres. The condition of the people on works or in their neighbourhood is good in Jubbulpore and Sehora, and fairly good in Murwara. There are not now many wanderers to be met with. Immigration from Native States has been checked, and the people now on the move are mainly the regular harvesters. There are bad cases in the poor-houses and relief centres, but the worst have now been collected there. In the villages the condition of the people varies with the proximity of works or centres; in the very distant villages it is bad, but the extension of village relief is gradually improving it."

The Deputy Commissioner of Saugor says :—

"On the whole the physical condition of the people is fairly good. Some weakly specimens are to be met with in poor-houses and among persons receiving gratuitous relief in their villages. But even here instances of extreme emaciation are rare, and, speaking generally, I have observed that the worst specimens in poor-houses are persons who have wandered into the district from outside, chiefly from Native States. The condition of the people on relief works is decidedly good."

"I think it may be confidently said that the measures taken for the relief of distress have now reached every corner of the district. Instances of emaciation are now rare, even in the most affected parts."

The Deputy Commissioner of Damoh writes :—

"The physical condition of the people on the relief works in the south is much better than of those in the north of the district. The poor-houses contain a considerable number of emaciated people whose recovery is unlikely."

In a recent report (*vide* this office No. 2564, dated 3rd instant) in which I referred to my recent inspection of most of the relief works in this district, I said of two Public Works Department relief works in the northern half of the district, that I found a considerable number of workers on them in a reduced condition, of a third Public Works Department relief work (further south) that with very few exceptions, the workers were in good condition, and of five local works in the southern portion of the district that there were some infirms, also some in reduced condition (chiefly Chamars and Basores), and at one work I noticed not a few children in a more or less emaciated condition, but that the physical condition of the workers, generally on these local works, was fair to good and better all round than that of the workers on the Public Works Department relief works in the northern portion of the district.

The Deputy Commissioner of Mandla says :—

"Those at poor-houses and relief centres are, as a rule, quite feeble and emaciated. Of course they improve gradually there, but many of them succumb to the privation they endured before reaching these institutions. Here the per-centage of such emaciated persons is, generally speaking, 75. The health of those working on Public Works Department relief works is generally very fair indeed, and per-centage of emaciation is very low. This is exactly what it should be, as weakly persons are always kept in the relief centres till they gather strength, when they are drafted to Public Works Department works. The condition of the people in distressed tracts is not very bad, and cases of emaciation, though met with, are not frequent."

The Deputy Commissioner of Seoni (Mr. Robertson) says :—

"On the three Public Works Department works, all of which I have inspected, I was impressed with the generally good physical condition of the labourers. Only at the Bamhori camp on the Seoni-Balaghat road, was it possible to see any considerable number of weakly persons. About 40 or 50 emaciated people were being fed from the kitchen attached to the camp. At the Purwa camp on the great Northern road near Lakhnadown, the labourers appeared in good condition. On the day of my visit, over a third of people on the works had gone away for a holiday to a fair which was being held in the neighbourhood. This is a sign that at any rate they were not in very reduced circumstances. On the Ghansore road work it was scarcely possible to find

among 2,000 persons employed, any one who did not look in good health and condition.

"During the month of February there was only one death on the works, although the number of the labourers had risen to over 2,500 in the third week of February. This speaks for itself as to the physical fitness of the workers. At the relief centres it is of course possible to see a considerable number of emaciated persons. But these are being fed and cared for, and so far as I have been able to learn, the police are very zealous in bringing all starving wanderers to such centres.

6. *Mortality-deaths from Starvation, &c.*—The mortality figures for the month of *January*, are reported as follows:—

District.	No. of Deaths.	Death-rate per Mille per Annum.	
		Exclusive of Towns.	Inclusive of Towns.
Jubbulpore - - - -	5,807	86·19	107·04
Saugor - - - - -	3,313	54·73	63·13
Damoh - - - - -	1,740	—	64·12
Mandla - - - - -	1,313	—	46·44
Seoni - - - - -	—	—	63·

The death-rate has fallen in Saugor, Damoh, and Mandla, and risen in the two other districts.

In Jubbulpore the death-rate which had been gradually falling from September to December last, when it was 60·00, has suddenly sprung up to a very high figure. The increase is most marked in the Murwara Tahsil, and in the town of Murwara, where there was very great mortality in the poor-house, as to which the Civil Surgeon writes that "if the admissions could only be seen, it would not be wondered at, as most of "them are stragglers from Native States, and are thoroughly exhausted on arrival." The immigration into the Murwara Tahsil of destitute persons from Native States, who came to our relief centres or were admitted into the Murwara Poor-house, accounts, I think, to a great extent for the exceptionally high mortality in the Murwara Tahsil. But there is also a very marked rise in the mortality in the Jubbulpore and Sehora Tahsils which it is difficult to account for except at such places as Sehora and Panagarh which are situated on the great highway for travellers to the South. The Civil Surgeon notices that the mortality is highest in circles where there are relief works or relief centres, which appears at first sight to be a paradox. But it is to these places that those in need of relief repair and the mortality must necessarily be higher among persons of this class than among those who are in no need of relief. Then it must be remembered that in many cases it is not food only that those who have suffered from privation require, but medical treatment and nursing. Attention has been paid to medical arrangements, and a special officer is in charge of them, but even with the best arrangements the nursing of the sick in outlying localities by strangers or even by their own friends must always leave much to be desired.

In Saugor the death-rate has fallen steadily from month to month since October, and the same is the case in Damoh. The death-rate has been lower in Mandla than in any other district for four months past.

Cholera appeared in Jubbulpore, Saugor, and Mandla, but the number of deaths was not large.

The following is a statement of the deaths reported to be directly or indirectly due to the famine:—

District.	Due to Starvation.	Accelerated by Privation.	Total.
Jubbulpore - - - -	Not distinguished.		2,708
Saugor - - - - -	Nil	425	425
Damoh - - - - -	9	186	195
Mandla - - - - -	8	166	174
Seoni - - - - -	30	29	59

The following is the distribution of the 2,708 deaths reported by the Jubbulpore police :—

Residents of the Station House Circle - - -	374
Wanderers - - - - -	257
Died in poor-houses - - - - - -	875
Died at relief centres or on relief works - -	1,202
	2,708

Out of the 2,708, 1,401 or more than one-half are reported from the Murwara Tahsil; and I find that the return includes 31 deaths from cholera on relief works. The figures apparently include all deaths due to sickness of any kind in the poor-houses or other places of relief, an interpretation of the expression "indirectly due to famine," which goes a little beyond the mark.

In January no deaths from starvation were reported from Saugor, but the Deputy Commissioner has since reported two deaths for that month, one of a boy deserted by his mother, and the other of an unknown wanderer. No deaths from starvation have been reported in February. The 425 deaths shown above as accelerated by privation, represent the total number of deaths from all causes in the poor-houses.

Of the 186 deaths returned as accelerated by privation in Damoh, 108 occurred in the poor-houses.

Of the eight deaths reported to be due to starvation in Mandla, in six cases the deceased is reported to have been ill for some days before death, and it is not clear that death was due to actual want of food. Of the deaths returned as accelerated by privation, 93 occurred in the poor-houses.

Of the 30 deaths ascribed to starvation in Seoni, 21 were travellers. The 29 deaths under the head "accelerated by privation," occurred in the poor-houses.

7. *Food Stocks.*—The Deputy Commissioner of Jubbulpore writes that food stocks appear to be generally sufficient for present requirements, and that inquiries have shown that the stocks in many parts of the district are larger than was thought to be the case a month ago.

The Deputy Commissioner of Saugor reports that there has been no complaint hitherto of insufficiency of food grain, and that he does not apprehend any insufficiency in the future.

The Deputy Commissioner of Damoh describes the food stocks as "fairly sufficient."

The Deputy Commissioner of Mandla writes that "food stocks are running short in "the interior of the district, especially in tracts far remote from relief works and "centres," while "the ordinary trade is keeping pace in replenishing the stocks at relief works and centres."

The Deputy Commissioner of Seoni writes :—"Food stocks are sufficient. The very "rich harvest of the Haveli tract has afforded temporary relief to great numbers of "people from the affected areas. On all the roads labourers can be seen going and "coming in the direction of the Haveli. Large numbers are now returning with "small stores of grain to their homes."

The following is a statement of the retail prices (in seers per rupee) of the chief staples at the head-quarters of each district at the end of the months of January and February respectively :—

District.	Wheat.		Gram.		Common Rice.	
	January.	February.	January.	February.	January.	February.
Jubbulpore - - -	9	10½	11	11½	9½	10
Saugor - - -	8	8	10	10	6½	7
Damoh - - - -	8	8	10	10¾	8	8
Mandla - - -	9	8	10	10	8	8½
Seoni - - - -	10	10½	11¼*	11*	9½	9¼

* Price of jowar.

Prices have fallen a little in Jubbulpore; elsewhere there has practically been no movement. I think that there is some cause for anxiety as to the efficiency of food stocks between the present time and the early autumn harvest, when the *rabí* harvesting is already begun and prices are still so high. It is to be hoped that a

substantial fall will take place by the time the *rabí* harvesting has been completed here and in Northern India.

8. *Importation of Grain.*—In Jubbulpore the imports by railway during the month of February amounted to 60,571 maunds, chiefly of Burma rice, and the exports to 22,980 maunds. In Saugor the imports were less than 600 maunds, the exports (chiefly of jowar to the Jhansi district) being 11,500 maunds. I am informed that railway communication between Saugor and Damoh is expected to be established during the hot weather to be suspended again in the rains. Mandla and Seoni are unconnected with the outer world by railway.

9. *General Condition and Prospects of Affected Areas.*—The general prospects of the *rabí* harvest as described in the summary for January are unaltered. The prevailing distress has been greatly alleviated for the time being by the extensive measures of relief in operation, and the beginning of the *rabí* harvesting has temporarily drawn away large numbers from the relief works. It is feared, however, that many of those who have flocked to the harvest will find themselves disappointed, for the area to be reaped is much below normal—the employment which harvesting can afford is proportionately diminished. Malguzars and cultivators will not employ more outside labour than they can possibly help, and the agricultural wage (in kind) which reapers and gleaners can earn is only one-half or less than one-half of what it was before the bad seasons began. Harvest savings will therefore be small. Much will depend on the mohwa crop and the extent to which the prices of food-grains fall by the time the *rabí* harvest is over. When it is over a large influx of labourers on the relief works is expected.

10. *Changes in the Rate of Wages.*—In Jubbulpore, Saugor, and Damoh wages continue to be calculated on the basis of 10 seers to the rupee. The rate in Mandla, eight seers, has also remained unaltered. The subject is not noticed in the Seoni report, but I have not heard of any change.

11. *Railway Works.*—The numbers employed on the Saugor-Katni extension have decreased as shown below. Labourers have been drawn away by the harvesting.

	30th January.	27th February.
Jubbulpore	8,784	3,692
Saugor	11,975	8,510
Damoh	9,080	8,918
	29,839	21,120

12. *General Remarks for the Division—(a.) Situation of the Division in regard to famine.*—The following is a comparative statement of the numbers relieved at the end of January and February respectively :—

	30th January.	27th February.
	Numbers relieved.	Numbers relieved.
(1.) Public Works Department relief works	72,841	72,808
(2.) Relief works under civil officers, including local works at relief centres	78,187	47,016
A.—Total relief works	151,028	119,824
(3.) Gratuitous relief in poor-houses	9,875	8,465
(4.) All other kinds of gratuitous relief, including dependants on Public Works Department works.	22,495	44,834
B.—Total gratuitous relief	32,370	53,299
Grand total of A. and B.	183,398	173,123

As regards (1), the net result of the establishment of new charges and the drafts from relief centres on the one hand and of the harvest attraction on the other is that the total number of workers is practically unchanged.

Under (2) the decrease is due to harvest attraction and the drafts from relief centres to Public Works Department relief works.

Under (4) the increase is due to the larger numbers on village relief and to the greater number of dependants on Public Works Department relief works. The latter increase is partly due to change of classification in the returns.

There are small differences between the totals shown under A. and B. above and those shown in columns 10 and 11 of the Divisional Famine Statement A. appended hereto. This is due to slight differences between the figures of the last weekly famine reports for Saugor and Damoh (from which I have taken the figures for the above table) and those given in the monthly Famine Statement A. for those districts.

(*b.*) *Measures taken to organise and complete Measures of Relief.*—The chief point to be noticed is the completion in all districts of the village relief organisation. The establishment of additional Public Works Department charges in Jubbulpore, Saugor, and Seoni, and the proposal to establish new charges in Mandla, have been already referred to. I was on tour in Damoh during the latter half of the month of February, and discussed with the Deputy Commissioner the question of the new works to be taken up in the hot weather, with special reference to the possibility of providing suitable employment in the rains. A separate memorandum which I drew up on the subject has been submitted to the Chief Commissioner. I referred in the summary for January to the strengthening of famine establishments by the deputation to famine duty in this division of certain officers of the Police and Forest Departments and of two officers of the Indian Medical Service. Mr. Sharp, of the Educational Department, and two Staff Corps Subalterns have since been similarly deputed to famine duty in the division. In Damoh two additional Tahsildars have been appointed for special famine duty.

(*c.*) *Prospects of the Division in regard to the Scarcity.*—In addition to the remarks made in paragraph 9 *supra*, I have only to repeat the observation made in my summary for January, that no permanent alleviation of the distress can be expected until the early rain crops are gathered.

Nagpur Division.

1. *Private Relief.*—There were only two private poor-houses in existence during the month of February as against five in the preceding month. These two institutions are located in the Umrer Tahsil of the Nagpur District. Rs. 3,000 were raised by private charity at Umrer, of which Rs. 43 were spent in affording relief to some 16 persons daily against 62 in January. One of these poor-houses is maintained from the sum of Rs. 500 specially set apart for the purpose by the late Atmaram Marwari, who was a resident of Umrer. The other is being maintained and looked after by some of the principal residents of the village of Bhiwapur. A subscription of Rs. 15 made by officials in Ramtek Tahsil helped in distributing gram to the resident paupers of that town. The Zamindar of Baila (in Balaghat) has continued to feed destitute wanderers at his own cost.

2. *Poor-house Relief.*—The number and locality of poor-houses have been the same as in the preceding month, viz., two in Nagpur, four in Bhandara, and three in Balaghat. As stated in the last report, both the poor-houses in Nagpur, two in Bhandara, and two in Balaghat, are maintained from private subscriptions and donations; but they are regarded as Government poor-houses for the reason that they are under Government supervision and are worked on the lines of the Famine Code. The number of inmates of all the poor-houses has risen from 2,341 to 3,116 (viz., Nagpur 937, Bhandara 787, and Balaghat 1,392). The increase is due partly to the diminishing demand for field labour and partly to the rule against beggars going wandering about the city and civil station being more strictly enforced. The subscriptions during the month towards the support of the Nagpur poor-houses amounted to Rs. 2,036. The total expenditure on all the poor-houses is reported to aggregate Rs. 6,091.

3. *Village Relief.*—An additional relief centre was opened (at Lalbara) in the Balaghat District. There are now in all four such centres against three in the month of January, and the number of persons relieved there is 74.

Fifteen *pardanashin* women were relieved at their houses in Balaghat, where the necessity for this kind of relief is beginning to be felt. In this district also Rs. 2,953 have been distributed among Mukkaddams through Revenue Inspectors and Tahsildars, and the number of persons relieved in this way is said to be 422 men, 285 women, and

446 children. Eight Revenue Inspectors are also employed on this work in Bhandara, where village-to-village relief appears to be becoming necessary.

The circumstances of the Nagpur district have not yet rendered it necessary to establish relief centres or village-to-village relief. The Deputy Commissioner, Chanda, reports "village relief commenced in Ambagarh Chauki, Panaharas, Gewardha, and Koracha. No details to hand."

4. *General Character of Relief Works, Nagpur.*—Of the four relief work camps, the Dighori Camp was closed on the 6th February owing to no more metal being required by the Public Works Department in that vicinity. The neighbouring relief camps remained open. The following table shows the number employed at each camp at the close of the month, as compared with those at work at the end of January :—

Camp.	Tahsil.	Number employed at close of February.	Number employed at close of January.
Boregaon	Nagpur	605	306
Madhoba	„	368	385
Digori	„	—	309
Umrer	Umrer	305	268
	Total	1,278	1,268

Arrangements have been made to start metal collection as a relief work at Mansar on the Great Northern road to relieve distress that is beginning to be felt in Dongartal Pargana. No local works were carried out; neither were any famine loans made, nor any new works—Public Works Department or otherwise—opened during the month.

Bhandara.—The same Government relief works (as in the previous month) under the Public Works Department have been in progress, viz. :—

	Number employed at end of January.	Number employed at end of February.
Tumsar-Rampaili, No. 1	1,471	2,663
„ No. 2	1,494	
Amgaon-Lanji	5,862	2,088
Gondia-Arjuni { Gondia end	3,366	2,447
Arjuni „	2,901	1,735
Total	15,094	8,933

In addition to these, 3,420 persons were relieved gratuitously on the works on 27th February, as against 1,462 at end of January.

Two hundred and sixty private works are reported to have been in progress during the month giving employment to over 8,000 persons, as shown below :—

Tahsil.	Number of Private Works.	Number employed on last Day of February.	Expenditure during the Month.
			Rs.
Bhandara	118	3,203	5,335
Tirora	106	3,731	5,910
Sakoli	36	1,167	2,580
Total	260	8,101	13,825

Out of the total expenditure Rs. 4,081 are reported to have been met from takavi, and Rs. 460 from Court of Wards Funds; the balance of Rs. 9,284 was defrayed from private sources. Rs. 55,000 have been allotted for famine loans.

Balaghat.—The following works under the Public Works Department were in progress during the month:—

	Number employed at end of February.	Number employed at end of January.
1. Lalbarra-Rampaili road	6,554	1,884
2. Balaghat-Baihar road, Sections I. and III.	2,549	1,834
3. Bakhari-Kona tank	740	471
4. Mohagaon tank	505	—
Total	10,348	4,189

In addition to these, 3,000 persons were fed gratuitously. Work on the first section of Balaghat-Baihar road has been completed and closed. No. 4 was transferred during the month by the Deputy Commissioner to the Public Works Department.

The amount allotted for famine loans is Rs. 95,000, and for ordinary loans Rs. 17,000. The Deputy Commissioner has given out in all Rs. 89,267 up to the end of February, of which Rs. 18,523 were advanced by him during the month. About 16,000 persons were reported to be employed on malguzari tank works on 27th February.

Chanda.—The relief works here consist of the construction of Nandgaon-Chauki Panabaras road, about 30 miles construction and repairs of works. No details are forthcoming.

5. *Physical Condition of the People, Nagpur.*—Cases of genuine emaciation are extremely rare, and those which do exist are of wanderers from distant places beyond the districts. With these exceptions, the physical condition of the people in receipt of gratuitous relief and those on works and in distressed tracts is generally good.

Bhandara.—All the relief works and poor-houses were inspected either by the Deputy Commissioner, Extra Assistant Commissioner, or the Civil Surgeon. Throughout the distressed area, and on the relief works, the condition of the people is fairly good, but cases of emaciation are becoming more frequent. These latter are said to be confined entirely to people who, although they were able to work, have obstinately refused to leave their houses.

Balaghat.—The general condition of the people on the works is good, but the new arrivals are not infrequently weak and emaciated. The Deputy Commissioner states that "the condition of the people in the distressed areas is getting worse." There has been great difficulty in getting people to move on to the works, but they are coming much more freely now.

Chanda.—The people are in fairly good condition. The Deputy Commissioner, who has just completed a tour through the distressed area, reports, however, to have seen traces of emaciation in some of the villages.

6. *Deaths from Starvation, Nagpur.*—Twenty-four persons are reported to have died from the effects of privation as against 30 in the preceding month. Of the former, three deaths occurred in the poor-house at Kamptee. Cholera broke out in Nagpur poor-house during the month, and 10 inmates fell victims to it. Cases of small-pox are rare. The figures for the previous month are as follows:—

Number of Deaths.		Mortality Rate per 1,000 per Annum.	
Inclusive of Towns.	Exclusive of Towns.	Inclusive of Towns.	Exclusive of Towns.
1,641	1,038	25·98	23·68

Bhandara.—The Deputy Commissioner has not submitted a detailed statement in prescribed form as the figures for February are not yet available. In January, 21 deaths were caused by starvation against 31 in December. The mortality statement appended to Deputy Commissioner's report shows that there were 2,590 deaths from all causes against 2,578 in December, the rate for the month being 3·48 per mille.

Of the above, 146 deaths were due to cholera. Deducting this latter figure, the death rate is 3·29 per mille per mensem.

Balaghat.—Two hundred and thirty-three deaths are attributed to starvation against 167 in the previous month. Of the former number, 202 occurred in the Balaghat poor-house. These were mostly new admissions received in a very weak state. The deaths were directly due to diarrhœa. The total number of deaths from all causes was 1,267 in the Balaghat Tahsil, and 471 in Baihar. These give a ratio of 4·31 and 5·26 respectively per mille.

Chanda.—Two deaths from starvation are reported, one being a man from Raj-nandgaon, who died on his way to Chauki, the other occurred in Mul.

7. *Food Stocks.*—In Nagpur and Bhandara food stocks are generally sufficient, and there is at present no reason to apprehend that private trade will fail to replenish them when exhausted. In Chanda, the food stocks, though greatly reduced, are for the present adequate. In Balaghat prices are rising steadily. The stocks were reported to be insufficient, and this is causing anxiety.

8. *Importation of Grain.*—

	Imports.	Exports.
Nagpur - - - -	1,02,377	22,975
Bhandara - - - - -	41,869	14,057

The exports from Nagpur were made chiefly to Berar, Wardha, and Nimar.

Balaghat.—Rs. 6,000 worth of grain is said to have been imported for the Baihar works.

Chanda.—Imports, 313 maunds; exports, 1,700 maunds towards Berar and Bombay.

9. *General Condition and Prospects of Affected Area.*—There is a slight increase of distress in Dongartal and Kondhali in the north-east and north-west, respectively, of the Nagpur District since the cessation of field work in those tracts. Arrangements have been made to open relief works (1) at Mansar for the Dongarthal tract, and (2) near Katol for the Kondhali tract. Takavi works are affording sufficient relief in the less affected areas in the south of the district. In Bhandara the affected area has been increased by 50 square miles, but it is feared that severe distress will prevail in Rampaili pergana as soon as the harvesting of the *rabi* crops there is completed. This will bring up the seriously affected area of the district to 650 square miles with a population of 2,10,000. Distress is likely to increase in the northern half of the Bhandara Tahsil and the south-east portion of the Takoli Tahsil, but the people in these parts will find sufficient employment on private works.

In Balaghat the condition and prospects of the affected area have become worse. The acuteness of the distress is much more marked, and the numbers coming for relief have suddenly and largely increased. Scarcity of food is reported in the affected area of the Chanda districts, but all possible relief is being afforded by the opening of tank works.

10. *Changes in Rates of Wages.*—There has been no material change in Nagpur, Balaghat, and Chanda. In Bhandara wages were paid on the basis of rice at 10 seers per rupee on all works up to 20th February, when the rate had to be raised to 9½ seers on all works except the Arjuni end of the Gondia-Arjuni road.

11. *State of Crime.*—Grain and cattle thefts are reported in Nagpur, Balaghat, and Chanda. On the whole, crime is on the increase, owing to prevailing high prices.

No. 292 C., dated the 11th March 1897.

From L. K. LAWRIE, Esq., I.C.S., Commissioner, Nerbudda Division, to the CHIEF SECRETARY TO THE CHIEF COMMISSIONER, Central Provinces.

With reference to paragraph 5 of Revenue Department letter No. 313, dated 19th January last, I have the honour to forward herewith consolidated Statements A. and

B. for the Hoshangabad, Narsinghpur, Betul, and Nimar districts of the division (with the district reports) for the four weeks ending on Saturday, the 27th ultimo. I also send the prescribed memorandum. The Chhindwara statements have not yet come to hand.

2. The month was remarkable for a falling off in the number of relief workers, as the following figures indicate :—

District.	Number on Relief Works on 30th January.	Number on Relief Works on 27th February.	Difference.
Hoshangabad	30,907	20,209	— 10,698
Narsinghpur	17,958	13,981	— 3,977
Betul	10,747	14,100	+ 3,453
Chhindwara	7,090	7,091	+ 1
Nimar	558	192	— 366
	67,260	55,573	— 11,687

It will be observed that the falling off occurred principally in the districts of Hoshangabad and Narsinghpur. The fall in Nimar is due to the closing of two road works, the Burhampur-Lalbag and the Harsud roads. In Chhindwara the total number of workers had reached 8,000 in the middle of February, so that here, too, there was a decline. In Betul, on the other hand, the number of workers has increased. The explanation of the facts seems to be that a considerable proportion of the workers in the Hoshangabad and Narsinghpur districts are cultivators, and many of these left the works in order to reap their crops. In Chhindwara and Betul there are fewer cultivators, and more persons—chiefly Gonds and Korkus—who have no *rabí* crops to reap. Probably when the mohwa crop is ready for gathering the Chhindwara and Betul districts will show a relatively larger decline in the number of workers than the other districts.

3. The next most noticeable feature is that while the number of workers declined the number of dependants and non-working children *increased*, *vide* the subjoined statement :—

District.	Number of Dependants, &c. on 30th January.	Number of Dependants, &c. on 27th February.	Difference.
Hoshangabad	5,409	6,381	+ 972
Narsinghpur	3,466	3,444	— 22
Betul	872	1,636	+ 764
Chhindwara	832	1,419	+ 587
Nimar	127	79	— 48
	10,706	12,959	+ 2,253

That a decrease of over 10,000 workers in the Hoshangabad district should be accompanied by an increase of nearly 1,000 in the number of dependants of workers is singular. So is also the fact that the withdrawal of nearly 4,000 workers in the Narsinghpur district occasioned only a reduction of 22 in the number of dependants. The conclusion is inevitable that in these districts there has been fraud in the matter of dependants. In fact, the Deputy Commissioner of Hoshangabad reports that he has discovered that on one work, the Pabai-Bagra road, children have been *borrowed* by workers in order that the latter may obtain the money dole of one pice per non-working child. With a view to stopping this practice I have ordered the discontinuance of many payments to dependants (other than children at the breast) on all works, the issue of cooked food from kitchens established on the works being substituted therefor.

4. Another form of fraud which was brought to my notice is the claiming of a subsistence wage under Article 54 of the Famine Code by persons representing themselves to be applicants for labour, but who in reality make an easy livelihood by repeated applications of the kind. I have ordered the abolition of this allowance, and the substitution of the plan of giving free meals to applicants for labour who are obviously so much reduced by privation as to be unable to set to work at once.

5. The poor-house population has declined slightly, the greatest reduction being in the Narsinghpur district.

District.	Number of Inmates of Poor-houses on 30th January.	Number of Inmates on 27th February.	Difference.
Hoshangabad	624	545	— 79
Narsinghpur	2,142	1,805	— 337
Betul	239	304	+ 65
Chhindwara	308	299	— 9
Nimar	61	105	+ 44
Total	3,374	3,058	— 316

Some of the inmates of the Narsinghpur and Hoshangabad poor-houses have been drafted on to relief works. In Narsinghpur, too, a certain number of inmates were discharged on their own applications, to allow them to go and find employment as reapers.

6. The number of persons relieved at relief centres has fallen from 2,223 to 1,808. Figures for the Hoshangabad district are not forthcoming. In Narsinghpur the fall is from 1,594 to 884. The "relief centres" in the Chhindwara Jaghirs, which show a rise from 623 to 896 in the number of persons fed, are really distributing centres for ordinary village relief. The organisation of village relief is complete in Narsinghpur, Betul, and Chhindwara, where the numbers so relieved were as under :—

District.	30th January.	27th February.	Difference.
Narsinghpur	276	324	+48
Betul	449	388	—61
Chhindwara	241	198	—43
Total	966	910	—56

7. The physical condition of the inhabitants of the distressed areas presents the same features. Good general condition on road works other than roads which pass through the southern forests of the Nerbudda Valley, and poor condition of the mendicants admitted to poor-houses. In the poor-houses of the Narsinghpur district the death-rate is high on this account.

8. The prospects of the *rabi* are estimated at from 6 to 8 annas in Narsinghpur, from 5 to 6 annas in Hoshangabad, and at barely 4 annas in Nimar. In Betul and Chhindwara the outlook is better. The prospects of mohwa crop are generally reported to be fair.

9. The number of relief works open in the division was 14 in December, 18 in January, and the same number in the month under report. Two additional road works, the Temri-Barkuch and the Harda-Sadhalpur-Dekhna roads, were opened in the Hoshangabad District, and two roads were, as already stated, closed in the Nimar District. The number of adult males at work on the latter, when they were closed, was only 15 (at Burhanpur) and 18 (at Harsud). The number of poor-houses (10) remained unchanged.

10. The principal increases taken during the month for the relief of the people or for the improvement of measures of relief already adopted were as follows. The arrangements for village relief in the Betul District were completed by placing eight circles in charge of Revenue Inspectors and appointing Forest Rangers to be Circle Inspectors for forest villages (Deputy Commissioner, Betul's No. 996, dated 23rd February). The village lists (or "registers of poor") of the Hoshangabad Tahsil were finally checked and passed, and payments are about to be made. Similar lists were drawn up for the jungly tracts of the Nimar District. The securing to villagers of their fair share of the mohwa crop was the subject of a proposal from the Deputy Commissioner, Chhindwara, in regard to the enforcement by Government of the provisions of Wajib-ul-arz on the subject (Deputy Commissioner's No. 173 C., dated 5th February), and I issued orders to all Courts of Wards that their tenants were to be treated liberally in this matter (No. 233 C., dated 24th February). Rules were issued for the guidance of district officers in the management of *orphanages* (this office

No. 150 C., dated 2nd February). As already stated, the issue of cooked food was ordered in substitution for money doles to dependants on relief works (this office No. 2192, dated 24th February). The supervision of relief works was facilitated by the posting of two staff corps officers to the Hoshangabad and Narsinghpur Districts, respectively, by the authorisation of inspections by District Superintendents of Police, Extra Assistant Commissioners, and selected Tahsildars (this office, No. 201 C., dated 11th February), and by the appointment of two additional Tahsildars to relieve the Tahsildars of Narsinghpur and Gadawara. The desirability of making a small money allowance to Kotwars in the Hoshangabad and Narsinghpur Districts was brought to the Chief Commissioner's notice in this office No. 2142, dated 25th February.

11. So far the price of the staple food (juari) has fallen slightly in Narsinghpur and Hoshangabad, while in Betul and Chhindwara a rise has set in, caused, it is said, by exports to Nagpur (and Khandesh). Owing to the small area sown with *rabi*, it seems unlikely that the *rabi* harvest of this division will appreciably affect prices. With the completion of the harvest the situation will be much as before. The mohwa crop will slightly relieve the pressure in some of the relief works for a time.

Nerbudda Division.

1. *Private Relief—Hoshangabad.*—No details given as to the expenditure and number of persons relieved. There is a private kitchen at Pachmarhi supported by subscriptions of the residents, and another at Harda.

Narsinghpur.—Total number relieved 120 at cost of Rs.200-2-3. Rai Bahadur Seth Tikaram feeds needy persons in the town of Narsinghpur.

Betul.—Nil.

Chhindwara.—This is still confined to the municipal town of Chhindwara, where 118 persons are in receipt of relief, as compared with 116 on the 30th January. The recipients are persons whose caste prevents their availing themselves of the more public forms of relief. The funds are subscribed as required by the wealthier residents of Chhindwara and deposited with a local banker.

Nimar.—There is a children's kitchen at Burhanpur supported by voluntary contributions. Rupees 274-8-0 were subscribed in February. Children fed numbered 121.

2. *Poor-house Relief:*—

District.	Number of Poor-houses.	Locality.	Number of Inmates.	
			On 30th January.	On 27th February.
Hoshangabad	2	Hoshangabad	624	545
Narsinghpur	3	Sohagpur		
Betul	1	Narsinghpur	2,142	1,085
Chhindwara	2	Gadarwara		
Nimar	2	Gotegaon		
		Badnur	239	304
		Chhindwara	308	299
		Amarwara		
		Khandwa	61	105
		Burhanpur		
Total	10	Total	3,374	3,058

No new poor-house was opened during the month.

3. *Village Relief.—Hoshangabad.*—Every station-house and outpost is a relief centre. Village relief still being organised. Arrangements complete for Hoshangabad Tahsil.

Narsinghpur.—Twenty-one relief centres (police stations and outposts). Number gratuitously relieved at these centres on 27th February was 884. Number of persons relieved *at their houses* 324.

Betul.—One relief centre (at Shahpur relief work). Number gratuitously relieved there 19. Number of persons relieved at *their homes* 388, so far as returns received show, but all returns not to hand.

Chhindwara.—Fifteen relief centres (in Jahagirs). Number gratuitously relieved at these centres 896. Number of persons relieved *at their homes* 198.

Nimar.—One relief centre at Harsud. Number relieved there 9. Village relief, nil. Lists are being prepared.

4. *Relief Works.*—The changes this month were :—

(1.) The closing of two roads, Burhanpur-Lalbag and Harsud, in Nimar.

(2) The opening of two roads, Temri-Barkuch and Harda-Sadhalpur-Dekhna, in Hoshangabad.

The numbers on the 18 works opened on 27th ultimo are compared below with the numbers on the 30th January.

On 30th January.	On 27th February.	Difference.
67,260	55,573	—11,687

For district details see covering letter.

5. *Physical Condition of the People.*—The remarks made in previous monthly reports are again applicable. The condition of inmates of poor-houses, who have been inmates for over a month, is, however, greatly improved.

6. *Deaths from Starvation.—Hoshangabad.*—None reported. Eighty-four deaths from privation.

Narsinghpur.—Three hundred and ninety-six outside poor-houses. Number said to be exaggerated.

Betul, 7
Chhindwara, 0
Nimar, 2
} Excluding deaths in poor-houses which cannot be described as "from starvation."

7. *Food Stocks.*—Generally reported to be adequate, but in Betul the stock of *juari* is running out.

Chhattisgarh Division.

1. *Private Relief.*—In the Bilaspur District Rs. 3,121 were raised in private subscriptions, the greater proportion of which is reported to have been spent in Government poor-houses. There are now no private poor-houses in this district, the existing ones being all managed by Government under the rules of the Famine Code. In the Raipur District there are two private poor-houses : one at Bisrampur under the management of the American Mission and kept up from funds raised in America, and the other at Gandai supported by zamindari funds ; apparently figures are not available as to the number relieved at these institutions and the total expenditure incurred during the month.

The Deputy Commissioner has been asked to obtain the figures now and report them to me.

2. *Poor-house Relief.*—As reported for the preceding month, there are three Government poor-houses in the Bilaspur District and five in the Raipur District. The latter will shortly be reduced to four, namely, at Simga, Raipur, Arang, Drug. In the former district it is proposed to open a new poor-house at Pendra. The total number relieved at the poor-houses in the Bilaspur District was 1,988 as compared with 1,249 in January. The figures are respectively 1,298 and 695 in the Raipur District. The number of inmates in the poor-houses is increasing daily.

3. *Village Relief.*—In the Bilaspur District four more relief centres were opened besides the one at Bhatapara, viz., at Kargi, Pendra, Pendri, and Lormi. The numbers relieved at these centres aggregate 2,269. At Kargi a tank work has been started. Village relief is reported as being organised in 450 villages of the Mungeli Tahsil and in about the same number of villages in the Bilaspur Tahsil. The village register of poor has been completed for 300 villages in the Mungeli Tahsil (Pandaria zamindari), and money is being distributed. In the Raipur District 13 relief centres have been opened, but the number relieved is not reported. Village relief is also stated to have been organised, but the number of villages to which this relief has been extended, the total number on the village register of poor, and the total expenditure incurred, is not stated. The Deputy Commissioner has been asked to furnish the information now. In the town of Raipur relief was granted during the month to the poorer people who

needed it, but in this connexion also the Deputy Commissioner has omitted to report the total number borne on the town register.

4. *General Character of Relief Works.*—Three large road works are being executed in the Bilaspur District. The numbers relieved by these works aggregate 10,976, as compared with 6,244 in the preceding month. Five local works have also been started by Government in this district. Further, 21,195 persons are reported to be relieved on works started by malguzars. In the Raipur District four large road works are being carried out, on which 16,857 relief workers are employed. On local works started by means of famine loans and by Government 20,328 persons are relieved.

5. *Physical Condition of the People.*—The Deputy Commissioner, Bilaspur, reports that the condition of those newly in receipt of gratuitous relief is bad, while the condition of the relief workers on the roads is generally good.

In the most severely affected tracts in this district the condition of the people is bad, and cases of emaciation are not uncommon. Such cases, however, will be reduced to a minimum owing to the systematic relief now afforded. The Deputy Commissioner, Raipur, merely remarks that the poorer people in the affected parts show signs of privation. I have drawn his special attention to the Chief Commissioner's orders requiring detailed information on this subject, and trust that full information will be supplied with the current month's return.

6. *Deaths from Starvation.*—Four hundred and seventy-eight deaths from starvation occurred in the Bilaspur district, as compared with 160 in January. The increase is partly due to fuller reporting and partly due to an increase of distress in the Pendra and Pandaria zamindaris. Of these deaths 154 occurred in poor-houses. Systematic village relief is being afforded while a sufficient number of relief centres have been opened. It is expected that the Deputy Commissioner will be able to report for the current month a substantial decline in the mortality from starvation. In the Raipur district the Deputy Commissioner has not yet been able to obtain complete statistics of the mortality from starvation. Twenty-five deaths from starvation are reported, but this is apparently very much below the actual figure.

7. *Food Stock.*—In the north-western zamindaris of the Raipur District and in the Lawn Pargana the food-stock is reported to be insufficient. In the Pendra and Pandaria zamindaris of the Bilaspur District also some deficiency exists, but the Deputy Commissioner writes that grain can easily be imported into these zamindaris, and he has no fear that private trade will not be able to meet the demand fully.

8. *Importation of Grain.*—In the Bilaspur District the imports amounted to 11,560 maunds, and exports to 22,675 maunds. The figures for the Raipur District were respectively 861 maunds, and 1,48,947 maunds. Exports have declined very considerably in the Bilaspur District, but are very large in the Raipur District.

9. *General Condition and Prospects of the Affected Areas.*—In both districts distress is severe in the worst affected parts. In certain areas the *rabi* crop is expected to afford considerable relief.

10. No change in wages occurred in the Raipur District. In the Bilaspur District the rate has also remained unaltered, except at Pandaria, where the rate has been increased from 10 seers per rupee to 9 seers per rupee.

11. Crime is reported to be on the increase in both districts. In the Bilaspur District theft cases have increased from 169 in January to 204 in February. The number of such cases in February 1896 was only 81. Ten dacoities are also reported to have occurred in the Bilaspur District during the past month.

Revenue Letter No. 9. From the GOVERNOR GENERAL OF INDIA IN COUNCIL to the RIGHT HON. LORD GEORGE F. HAMILTON, M.P., Her Majesty's Secretary of State for India, dated Calcutta, February 24, 1897.

MY LORD,

WE forward, for your Lordship's information, copies of a resolution No. 745,* dated the 1st February 1897, and published in the Local Gazette of the Central

---

* *Vide*, C. 8388, p. 114.

Provinces, in which the Chief Commissioner of the Central Provinces describes the failure of successive harvests in the districts of the Jubbulpore Division and reviews the measures undertaken during the period by him for the relief of distress. We also forward a copy of a letter,* No. 849, dated 12th February 1897, subsequently received from the Chief Commissioner, in which he reports the situation in each district as it now presents itself to him, describes the relief measures adopted, and gives a forecast of the probable future duration and extent of the distress.

2. In the resolution the narrative of events is brought down to the end of September 1896, and in paragraph 20 the Chief Commissioner records his intention of supplementing it by a similar connected review of the action taken by him subsequent to that date when the provinces entered on a still more serious period of distress. We consider that as regards the period with which it exclusively deals, the resolution effectively disposes of the charge of inactivity which has been made against the Administration of the Central Provinces in the public press. We consider that in his letter dealing with the present situation and the relief measures in progress in each district, the Chief Commissioner shows that the distress has been thoroughly grappled with, and that the scheme of relief is sufficient and satisfactory and well adapted to an admittedly difficult situation. We have every reason to anticipate that when the Chief Commissioner reviews the narrative of events from the date at which the resolution of the 1st February stops, he will be able to vindicate his Administration as regards this latter period, as he has now, in our opinion, done as regards the earlier period.

3. We deplore the high mortality which is shown in the resolution to have occurred during the hot weather and the rains of 1896 throughout the Central Provinces, and more particularly in the Jubbulpore Division. But we would remark that during the same period the death-rate of some of the Bundelkhand districts of the North-Western Provinces, where famine relief has been conducted in an exceptionally skilful and complete manner, has also been very high. A statement of the mortality in those districts for September and October and in the Jubbulpore Division for the months of September, October, and November is appended. The mortality throughout the Jubbulpore Division diminished materially in November, and, we are informed, also in December, but the exact figures for the latter month have not yet reached us. We fear that it is not within the power of the administration to keep the mortality of a Province within its ordinary limits throughout a protracted period of distress during which not only is food dear and bad, but climatic conditions are abnormal and the general vitality of the population is lowered. In compliance with your Lordship's wishes conveyed in Despatch No. 9 (Revenue), dated 15th January 1897, to have the earliest possible information of any considerable rise in the death-rate above normal, and also a periodical report of continued mortality of an unusually high rate in any Province, we have issued instructions to Local Governments and Administrations to return to us month by month the death-rate of every district in which famine operations are in progress or in which the existence of distress is apprehended, and we shall keep your Lordship duly informed.

We have, &c.

NORTH-WEST PROVINCES AND OUDH.

No. 417-S., dated Allahabad, the 14th December 1896.

From the SECRETARY TO THE GOVERNMENT OF THE NORTH-WESTERN PROVINCES AND OUDH to the SECRETARY TO THE GOVERNMENT OF INDIA.

In his demi-official letter of the 29th November Mr. H. F. Evans enclosed, for the information of the Government of India, copy of a letter addressed to officers, asking them to report what effect had been produced by the late rainfall on the prospects of their respective districts. The Government is still awaiting these replies, but provisional information has been received from Commissioners of Divisions, from which it appears that they are of the opinion that prospects have been so far improved as to justify the expectation that with fair winter rains the numbers who may come on relief will be less by about 25 per cent. than the number of 100,000,000 units for one day, stated in the third column of Statement B., paragraph 10 of this office letter No. 196, dated the 23rd November 1896. In this opinion the Lieutenant-Governor generally concurs, and he now sees reason to hope that it will not be necessary in several districts to undertake relief operations to the extent which seemed probable before the late rain had fallen. In view of the altered condition of things, and with the object of avoiding unnecessary expenditure, the Lieutenant-Governor has reconsidered the programme of public works referred to in paragraphs 19 and 20 of the letter mentioned above, and has consulted Commissioners of Divisions on the following point: whether it would be desirable to pursue the policy indicated in paragraph 20 of the letter noticed above, and postpone village works till the hot weather had set in; or whether in view of the probability that in certain districts the necessity for extensive relief would disappear when the *rabí* had been harvested, it would be better to meet the demand for employment which may arise between now and the harvesting of the *rabí* by a more general use of village works now than had been intended. The Commissioners' official replies are awaited, but from the communications unofficially made by them to his Honour, it seems certain that they will ask for permission to begin some village works at once, and also to maintain a backbone of some large works managed by the Department of Public Works in the various districts. These works are now in operation in many districts.

2. The question also presented itself whether, in districts in which prospects have improved, it was desirable where village works were not found to afford suitable

employment, to open relief works under strict Code rules. Under the Code three classes of work are recognised:—

(1.) Ordinary works (Article 60) debitable to provincial or district funds.

(2.) Test relief works debitable to famine relief, and carried out in the general spirit of the Famine Code Rules.

(3.) Regular relief works under Chaper VI. of the Code, on which the "gang" and "task" work system is rigidly enforced.

In almost all districts funds, either provincial or district, for ordinary works have been exhausted; while, at the same time, test works have shown the necessity for some employment, though not on the expensive or extensive system prescribed by the Famine Code. The problem, then, was to provide such employment as would be suitable for districts under observation, but in which distress had not fully declared itself. Such employment is offered, for example, in the Cawnpore district by the Lower Ganges extension canal project, and in the Azamgarh District, to some extent, by the extensions of the Bengal and North-Western Railway.

3. These facts have suggested to his Honour the adoption in such localities of a modified system of famine relief works which would be intermediate between works carried out on the ordinary and on the Famine Code systems. Such works, while conducted on principles involving much less expenditure than would be incurred were the system of the Code followed, will serve as test works on a large scale. Their existence, with the establishment thereon, will also enable the Government to at once convert them into Famine Code works without a day's delay should famine supervene. It need hardly be observed that no advantage will be taken of this arrangement to carry through works in the interest of district or provincial funds; and that no work will be begun which is not absolutely essential with the object of preventing suffering from want of food.

I am to add that this plan has been forced on his Honour for two reasons: first, economy, and second, the extreme difficulty of obtaining the large number of subordinate officers necessary for Famine Code works.

4. I am to forward a copy of the instructions* which have issued on the subject, which will explain more fully the action which the Lieutenant-Governor has decided to take.

No. 357 S.–73, dated Allahabad, the 5th December 1896.

From T. W. HOLDERNESS, Esq., Secretary to the Government of the North-Western Provinces and Oudh, to ALL COMMISSIONERS OF DIVISIONS, North-Western Provinces and Oudh.

I am directed to address you on the subject of the employment of the Public Works Department in managing and carrying out famine relief works. At the present time distress is officially recognised as existing in the districts mentioned below,† and the Public Works Department has already commenced relief operations in these districts. Any relief work not being of the Article 65 (*a*) class opened in the marginally noted districts for the future must be treated as relief works under the Code and managed from the outset by the Public Works Department.

2. Article 60 of the Famine Code provides that where distress is commencing, ordinary works may be expanded as a temporary measure to meet the demand for employment. In these districts, that is, districts not officially declared to be distressed, it is open to you to commence test works in order to gauge the necessity for relief works. But experience has shown that test relief works managed by non-professional agency do not always gauge the existence of distress so well as works conducted under the strict safeguards and test which are necessarily applied by the Public Works Department. I am therefore to request that when the necessity contemplated by Article 60 arises, you will ordinarily employ the Public Works Department in controlling test works, or, when ordinary works are exhausted, in affording the employment necessary on a suitable work included in the relief programme, piece-work at rates suitable for the object in view being substituted for contracts. When the pressure of distress becomes such as to render the enforcement of piece-work as above mentioned unsuitable, these works can be readily converted into relief works under Articles 70 and 74 of the Famine Code. The existence of a work in progress, with establishments on the spot, will place you in a far better position to meet any sudden pressure or rush of labourers than if the work had to be opened to meet a sudden and

* G. O. No. 357 S.–73, dated 5th December 1896.

† Allahabad, Hamirpur, Banda, Jhansi, Jalan, Jaunpur, Rae Bareli, Sitapur, Hardoi.

particular demand. Moreover, the existence of a work managed by the Public Works Department on the piece work system as sketched above may satisfy all the requirements of a tract of country not acutely distressed, while the cost to Government will be much less than would be the case if regular relief works under the provisions of the Famine Code had to be established. You will not fail to observe that this system of works, which are intermediate between "ordinary" and "Code relief works," will be peculiarly useful as a reserve and supplement to the system of village works [Article 65 (*a*)] managed by the district officers directly or by local zamindars.

3. Further orders dealing with the manner in which these orders are to be given effect to in detail will issue from the Public Works Department to Superintending Engineers, copies of which will be forwarded to you for information and guidance.

No. 358 S.–73.

Copy forwarded to the Secretary to this Government in the Public Works Department Buildings and Roads Branch, for necessary action with reference to paragraph 3.

No. 500, dated Allahabad, the 21st December 1896.

From P. HARRISON, Esq., Under-Secretary to the Government of the North-Western Provinces and Oudh, to the SECRETARY TO THE GOVERNMENT OF INDIA.

In continuation of this Government's letter No. 417, dated the 14th December 1896, I am directed to forward, for the information of the Government of India, copies of the letter mentioned below,* relative to the adoption in certain localities of a modified system of famine relief works which will be intermediate between works carried out under the ordinary and on the famine Code system.

No. 9099 W. A., dated Allahabad, the 5th December 1896.

From C. W. ODLING, Esq., Secretary to Government, North-Western Provinces and Oudh, Public Works Department, to ALL SUPERINTENDING ENGINEERS, Provincial Works.

The Lieutenant-Governor and Chief Commissioner has had under consideration the best method of testing the probability or existence of distress, and of affording employment in districts which are under observation, that is, districts in which famine threatens, but in which the existence of famine has not been officially recognised. His Honour is of opinion that the needful test will be best effected and the necessary employment afforded by work carried out on a system intermediate between "ordinary" and "Famine Code works," and this view is expressed in the orders issued in the Scarcity Department, of which a copy will be separately forwarded for your information and guidance.

2. In relief works under the Famine Code (Articles 70 and 74) the enforcement of the "gang" and task systems is imperative. The works proposed in the preceding paragraph may be regarded as preliminary to regular relief works under the Code. Should distress supervene, it would be very easy to convert these works from the piece-work to the task and gang system, and to expand the establishments.

3. But, while the works remain outside the strict letter of Code rules, it is proposed that the rates given shall, in view of the high price of food, be enhanced by 25 to, in particular cases, 50 per cent., *i.e.*, from Rs. 2 per 1,000 cubic feet of earthwork to Rs. 2-8-0 or Rs. 3. It is not intended that these works shall be given out on contract, but rather to piece-workers or gangers employing not more than 200 persons. Men of the *chaprasi* class, relatives of petty officials, should on no account be employed. Village *pattidars* are very suitable men, but in any case the piece-worker must actually reside on the work, and deal directly with the workers, who will then, with the class of men employed, be in a position to insist on a fixed proportion of the rate being paid to them. In giving out the work the wages to be paid to the workers would be specified; and it is considered that ordinarily 20 per cent. of the rate would

* Letter No. 9099 W. A., dated 5th December 1896, from the Secretary to Government, North-Western Provinces and Oudh, Public Works Department, to all Superintending Engineers, Provincial Works.

be a sufficient remuneration to the piece-worker for his own labour, interest on capital, and incidental expenses, such as baskets and perishable stores. It would be necessary to pay the piece-worker weekly, or at most fortnightly, as he would generally be a man of very small capital. The workers would usually bring their own *phaoras*, but at times it might be necessary to issue such tools to the piece-worker. In order that the piece workers employed may comply with the conditions laid down in this letter, it may be necessary to impose the condition that a piece-worker who cannot carry out work to the value af Rs. 150 in a month will be discharged, whilst no piece-worker will be allowed to execute work to the value of more than Rs. 1,000 in one month.

4. Works on the lines mentioned will also serve as test works, the number and class of labourers resorting to the work being indicative of the sufficiency of the work to meet the degree of pressure, or the necessity for relief works under the Code. But they will not prevent test works under Code rules and on subsistence wages being also established provided that they are some distance (5 miles or more) apart. It will not, however, be possible to carry out works on the plan sketched above in a tract declared to be distressed such as the districts mentioned below.* In these districts and in any other district recognised as distressed, the Code rules must be strictly followed. A manual of these rules is under issue for your guidance.

5. The works to be carried out under the terms mentioned in paragraph 3 above will be confined to those for which detailed estimates have been sanctioned, and you should at once place yourself in communication with Commissioners of divisions in your circle with the view of putting one or more works in hand in those districts where they consider them to be required. The work put in hand must, unless with the express sanction of Government, be limited to what can be carried out by famine labour. Subject to the restrictions mentioned above, the works should be selected by Commissioners and may (provided there is an allotment for famine relief works for the district in which the work is situated, *but not otherwise*) be commenced under your orders in anticipation of the approval of Government. An immediate report giving the name of the work, the amount of the estimate, and date of commencement, should, however, be made. The rate it is proposed to pay for earthwork should be mentioned.

6. Works carried out under the orders contained in this letter will be charged to the head Famine Relief and provided for from the allotment made, under that head, for such works in the district concerned. The usual weekly famine reports to the Chief Engineer will be required, and arrangements must be made to keep a record of the number of men employed.

Copy forwarded to all Commissioners of divisions and Collectors of districts, to the Examiner, Public Works Accounts, North-Western Provinces and Oudh, and to the Scarcity Department of this Government, for information.

No. 255 F., dated Calcutta, the 16th January 1897.

From DENZIL IBBETSON, Esq., C.S.I., I.C.S., Secretary to the Government of India, to the SECRETARY TO THE GOVERNMENT OF THE NORTH-WESTERN PROVINCES AND OUDH, Scarcity Department.

I am directed to acknowledge the receipt of your letters Nos. 417 and 500, dated the 14th and 21st December 1896, respectively, regarding the adoption in certain localities of a modified system of relief works which will be carried out under a system of piece-work by gangs, the members of which will be entitled to certain payments, and which will occupy a position intermediate between works carried out on the ordinary system of petty contract and those conducted under the strict conditions of the Famine Code.

2. His Honour the Lieutenant-Governor has been led to introduce this intermediate system by the difficulty of obtaining the large establishments that are necessary for work under the strict provisions of the Famine Code and by the great cost of such works, The Government of India understand that the economy of this new system

* Banda, Hamirpur, Jhansi, Jalaun, Allahabad, Jaunpur, Rae Bareli, Sitapur, Hardoi.

depends upon the fact that, in tracts where the distress though real has not deepened into famine, if the able-bodied workers are employed on piece-work, the women and children will in the main be supported at home by the earnings of the workers, supplemented by such additions to them as they can obtain in their own villages; whereas if the task-work system is strictly enforced, the women and children must at once come on to the works, since the famine wage is sufficient only to support the workers themselves. If this be so, piece-work appears to be advisable so long as the mass of inefficient labour can find support without relief from Government.

3. It is, however, very necessary, as already explained in my Circular No. 3–77–1 F., dated the 24th December 1896, that the rates given should be so regulated as to act as an efficient test of the intensity of distress. They should be such as to constitute a somewhat hard bargain even with the skilled labourer; and should be distinctly below what it would be necessary to give in order to attract labour in the absence of distress. When this is the case, inefficient labour paid by the piece will earn but a bare subsistence, so that the extent of the demand by inefficient labour for employment on these terms will sufficiently gauge the intensity of the distress.

4. The Government of India understand these to be the principles on which his Honour the Lieutenant-Governor has introduced his intermediate system of piece-work, and that as soon as the demand for employment by inefficient labour indicates that distress has reached an acute stage, the ordinary task-work system of the Famine Code will be substituted.

5. The Governor-General in Council gives his hearty approval to the proposals.

No. 549 of 1897, dated Allahabad, February, 22, 1897.

From the SECRETARY TO GOVERNMENT, North-Western Provinces and Oudh, to the SECRETARY TO THE GOVERNMENT OF INDIA, REVENUE AND AGRICULTURAL DEPARTMENT.

SIR,

I AM directed to forward the monthly Famine Statements A. and B. for these Provinces, which give an account of the relief operations up to 30th January 1897, in 17 districts officially recognised as distressed. Subsequent to the close of the period to which the last report related, the districts of Agra, Etáwah, Mirzapur, Gorakhpur, and Bara Banki have been added to the list, and the prescribed maps for these districts are accordingly submitted. The additional extra-Code Statement C., containing particulars in regard to the districts which were under observation during the period under report, though not officially declared distressed, is also attached.

The Lieutenant-Governor fears that the figures of expenditure contained in Statement B. are incomplete, and that the total sum actually disbursed is much greater than than that shown in the statement. For instance, in regard to the sums shown as advanced under the Land Improvement and the Agricultural Loans Acts, I am to say that the Board of Revenue have allotted more than 19 lakhs of rupees for advances for the construction of wells and for seed grain alone. The figures entered in the statement are the aggregates of those furnished in the district returns, and appear in this and other respects incomplete. The time allowed for the compilation of this return is so short that it has not been found possible to ensure accuracy without further references entailing a delay which would very seriously affect the punctual submission of these statements. In the ensuing month an effort will be made to obtain more complete and accurate figures, but it is unlikely that, with the constant disbursements frequently made in many districts and under many heads of account, complete accuracy in any month can be ensured until the final accounts come to be compiled and audited. Similarly some suspicion attaches to the figures showing the programme of works in columns 6 and 7 of Statement B., but the necessary steps have been taken to replenish the programme in all those districts where the figures in these columns show any indication that it is likely to become exhausted.

I have, &c.
T. STOKER,
Secretary to Government,
North-Western Provinces and Oudh.

North-Western Provinces and Oudh.

* On test works in portion of district not yet officially recognised as distressed.

REMARKS to accompany FAMINE STATEMENT A. for the Five Weeks ending 30th January 1897.

PRIVATE RELIEF, VILLAGE AND POOR-HOUSE RELIEF.

Agra.—Private subscriptions to the extent of Rs. 23,000 were collected or promised previous to the month under report, but during the month no further subscriptions were received. The Government contributes Rs. 2,500 monthly towards relief under Chapters V. and X. of the Famine Code in Agra city on condition that an equal amount is furnished by private charity. In villages and towns in the district relief under Chapters V. and X. is distributed by tahsil relief committees. There are five poor-houses open.

Etáwah.—A few wealthy men in Etáwah city and in the interior of the district distribute charity daily or afford relief to the people of their own villages by giving them employment as labourers. People of the middle class cannot afford to help the poor, as the prevailing distress has touched them also. Relief is being administered in villages under Chapters V. and X. of the Code. There is one poor-house at the head-quarters of the district, in which the number of inmates on 30th January was 93.

Cawnpore.—There are six poor-houses, two of which were opened during the month under report. The total number of inmates on 30th January was 2,033. Village relief has been developed and is now being systematically administered throughout the district, with the result that the number of inmates of poor-houses has sensibly diminished.

Bánda.—Very little private relief is afforded. The numbers in receipt of relief under Chapters V. and X. of the Code have increased considerably, owing to the general prevalence of distress. The number of poor-houses open was the same as last month, viz., seven, but the number of inmates increased from 5,024 on 26th December to 6,169 on 30th January.

Hamírpur.—A few well-to-do persons distribute doles indiscriminately to beggars. Clothing and blankets are supplied to inmates of poor-houses and other recipients of relief from the charitable fund referred to in the last report. There are five poor-houses, the numbers in which are increasing in spite of the regular weeding out of those fit to go on the relief works or to whom relief at their homes under section 54 of the Code is better fitted. The system of village relief is being extended. The number of persons in receipt of such relief on 30th January was 4,661 against 1,503 on 26th December.

Allahabad.—There are 10 poor-houses, containing 7,923 inmates. Efforts have been made to limit the numbers by drafting the paupers on to works as soon as they become fitted for work, and several thousands have passed through the poor-house in this way. A number have also been sent back to their villages to be relieved there. The village lists drawn up under Chapters V. and X. of the Code now include about 9,500 persons, who are given relief at their homes; and over 3,000 others are similarly relieved in the city of Allahabad by the Charitable Committee which has been formed there.

Jhánsi.—A considerable number of persons was relieved in Jhánsi city by private charity. The four poor-houses referred to in the last report are still open, and the number of inmates continues to increase, notwithstanding that large numbers are continually being drafted on to the relief works. Two new poor-houses are under construction and will be opened shortly.

Jalaun.—In a few villages zamindars have undertaken the carrying out of small works for the benefit of their tenants. Village relief was given liberally during the latter part of the month to many feeble persons who it was thought would not be able to bear exposure on the relief works owing to the weather being wet and cold. The poor-house population as they become fit are drafted to relief works or else sent to their villages and there relieved gratuitously.

Mirzapur.—Private relief is nowhere given except in Mirzapur city, where several persons distribute alms. A local committee has been formed and is raising funds with the object of affording relief of the nature described in Chapter X. of the Famine Code. The system of village relief was not in force during the period under report, but it is now being rapidly organised. Four poor-houses are open, which contain about 3,500 inmates.

Jaunpur.—Of private relief there is very little. Village relief is being given to *parda nashín* women and the poor inhabitants of municipal and Act XX. towns, and arrangements have been made to extend it generally during the current month. There are three poor-houses open.

Gorakhpur.—There is no organised private relief. Village relief has been undertaken on an extensive scale, and will tend to diminish the poor-house population.

Lucknow.—The village relief system has been generally extended, and the numbers in receipt of relief have increased largely. The poor-house population has also increased temporarily, but in view of the extension of village relief and of the fact that drafts are continually being sent on to the relief works, the numbers may be expected to fall very shortly.

Unao.—Village relief has been effectively organised. It is expected that the numbers that will require relief under Chapters V. and X. of the Code will not exceed 2 per cent. of the population.

Rae Bareli.—There are four poor-houses open, and village relief under Chapters V. and X. of the Code is being given throughout the district. Village to village inquiries are being made, which will probably result in a further extension of the system of village relief.

Sitapur.—Gratuitous relief under Chapter X. of the Code has been substituted for the private relief in Sitapur town which was referred to in the last report. Private subscriptions have been turned to account in supplying clothing to inmates of poor-houses. The system of village relief has been brought into force, and the number so relieved during the period under report was 6,186.

Hardoi.—No general relief from private funds has been organised. Village lists have been prepared, and relief is administered with the co-operation of taluqdárs, zamindárs, and members of Municipal Boards.

Bara Banki.—There are three private poor-houses, and many of the taluqdárs and zamindárs distribute food daily at their houses. The village relief system is in force, and doles are distributed through the agency of resident zamindárs or village headmen. Six poor-houses are open under proper control and with adequate establishments. They meet all present requirements.

General Character of Relief Works.

In all districts the large relief works in operation are under the management of the Public Works Department, and are conducted in strict accordance with the provisions of the Famine Code. The task and gang system is in force, and the wage is regulated in accordance with the price of the ordinary food grains of the people, being also graduated, as regards maximum rates, by the extent to which the prescribed tasks are performed by the workers. Children and adults who are unable to work, but who form part of the family of a worker, receive gratuitous relief in the form of a subsistence dole as "dependants." As a general rule, relief works consist of road work, but the deepening and improving of tanks within a reasonable distance of a road project are always carried on *pari passu* as part of the project. In some districts employment is being given through the agency of landholders by means of village works executed by means of advances from Government, which will be partly recoverable, and which are made on conditions that secure that work is given at fair wages to those classes of persons who are most in need of employment.

In Allahabad village tank work, chiefly under Public Works Department control, has been greatly extended and affords very wide employment near their homes to people of the distressed tracts.

Physical Condition of the People.

Agra.—The people who come to the relief works are fairly well nourished. They belong almost without exception to the labouring class, who at the present time can find but little work in the fields.

Etáwah.—The physical condition of the people is reported to be generally good.

Cawnpore.—The condition of the labourers on relief works is generally fair.

Bánda.—The people on relief works and in the poor-houses are generally in fair condition.

Hamírpur.—The labouring classes are much reduced, but otherwise the condition of the people is fair.

Allahabad.—No change is reported in the condition of the people.

Jhánsi.—There is no noticeable alteration in the physical condition of the people, but the mortality still continues high.

Jalaun.—In the more seriously affected parts of the district the condition of the poorer classes is noticeably weak, but the regular food and occupation on the relief works is doing much to restore them.

Mirzapur.—A considerable number are reported to be reduced.

Jaunpur.—Severe distress is very apparent among the beggars and some of the labouring class.

Gorakhpur.—The physical condition of the majority of the people is not such as to create alarm, though persons may be observed in all directions very reduced in physique.

Lucknow.—Condition of people on the works is very fair. Some cases of emaciation were discovered in villages and are now receiving relief at their homes.

Unao.—The condition of the people is generally good.

Rae Bareli.—The condition of the people is reported not to be satisfactory owing to pressure of prices.

Sitapur.—The people are not in a bad condition as a whole, though a good many cases of emaciation are reported from two works.

Hardoi. A certain proportion of the labouring classes is pulled down, and the small tenants and petty zamindárs are now feeling the pinch of distress.

Bara Banki.—The labourers on the relief works are reported to be generally in good condition.

Deaths from Starvation.

Three deaths are reported to have occurred during the period under report from actual starvation—one in Jalaun from exposure, aggravated by starvation, one in Unao, and one in Sitapur. In the last named district five deaths are reported to have occurred in December also. In Mirzapur and Jaunpur a few deaths have been reported, but do not seem to have been verified.

Food Stocks and Importation of Grain.

Food stocks are nowhere insufficient, private trade active, and imports considerable, including much Rangoon rice, which is now selling in the village *bázárs*. In Lucknow and Hardoi supplies are said to be short in the smaller villages, but in some parts the village supplies are drawn from the larger centres, as local stocks are being depleted.

General Condition and Prospects of the Affected Area.

Agra.—Judging from the attendance on the relief works, there is no extensive distress outside Agra city. Prices fell noticeably from about the 25th January and have not since again risen.

Etáwah.—The rain which fell in the district on the 21st and 27th January has tended to lower prices slightly. The affected area in this district is entirely dependent on rain, there being no well or canal irrigation. The *kharíf* harvest was poor, and the *rabí* sowings insignificant, and large numbers of the people have come on to the relief works. Considerable numbers also have migrated, and the relief works are largely swollen by immigrants from Gwalior. The prospects of the affected tract depend on the next autumnal rain.

Cawnpore.—The whole of the district is now affected by famine. The *rabí* prospects in the irrigated tracts are good, but high prices have depressed the condition of the labouring classes, who have been thrown out of employment owing to the recent rainfall having checked irrigation. Fresh relief works are being opened in the centre and north of the district, and the demand for employment is not likely to lessen until April next, when the *rabí* crop will be harvested.

Bánda.—The rain which fell in January was beneficial to the standing *rabí* crops. The prospects of the *mahua* crop are also better. Further barley sowings on an inconsiderable scale are reported. The general outlook has slightly improved, but the high prices prevailing still press very hard on the people.

Hamírpur.—There are six relief works in progress as against three in December, and the number of workers is increasing. The rain which fell on the 21st, 23rd, and 25th was beneficial to the crop sown late, but injurious in parts to those already in flower. Some damage was caused by hail in parts of the district.

Allahabad.—The rain which fell in January benefited the standing crops, but did not allow of any appreciable increase to the area sown.

Jhánsi.—With the exception of slight damage caused to the crops in flower in one tahsil, the rain which fell in January has been of incalculable benefit. The general prospects of the district are now much improved.

Jalaun.—The *rabí* crop as a whole promises excellently except in a few places, where it has been damaged by hail. Should the outturn realise the present expectations, it is hoped that the distress in the northern part of the district will almost entirely disappear. In the remaining four-fifths of the district, however, there is no hope of amelioration till the monsoon breaks.

Mirzapur.—The *rabí* crop promises well, but in the most distressed tracts it represents only a small per-centage of the average *rabí* area. The present condition of the district is distinctly unfavourable.

Jaunpur.—The rain which fell in January has improved the crop, and if no more falls, the *rabí* should be very fair. On the other hand, however, the rain stopped all demand for labour on irrigation, and labourers are consequently flocking to the relief works in large numbers.

Gorakhpur.—The *rabí* area sown is 61 per cent. of the average, and the crop promises well, but it is not anticipated that the distress will entirely cease among the lower classes, even after the harvest.

Lucknow.—The prospects of the district have been greatly improved by the recent rain. The *rabí* crop is expected to yield an excellent outturn.

Unao.—There was abundant rain in the beginning of the month, with the result of setting free all field labour. This led to a rapid increase in the numbers on relief works. The *rabí* is everywhere an excellent crop, and it is hoped that distress will begin to abate with the expiry of the present month.

Rae Bareli.—As in Unao, the rain, while benefiting the crops, deprived the field labourers of their employment.

Sitapur.—The prospects of the *rabí* are generally very favourable.

Hardoi.—The poorer classes are generally in a straitened condition, and there are no signs of abatement of the distress. The numbers on relief works are daily increasing. The prospects of the *rabí* are so far excellent where irrigation has been possible.

Bara Banki.—The crops are in most excellent condition. Such good *rabí* prospects have not been known for years. The harvest will be an early one, and with it the demand for employment on the relief works may be expected to abate very considerably, if not to cease altogether.

Changes in Rates of Wages.

The wages are regulated in accordance with the provisions of the Famine Code, having regard to the prices current of food grains.

North-Western Provinces and Oudh.

Monthly Famine Statement B. for the Five Weeks ending Saturday Evening, the 30th January 1897.

Telegram dated the 18th March 1897.

From LUCKNOW to CALCUTTA.

From NORTH-WESTERN PROVINCES, Scarcity, to REVENUE.

Your telegram 833. No epidemic. Excess mortality, January, shown by Sanitary Commissioner due to fever.

No. 783, dated Allahabad, the 20th March 1897.

From the SECRETARY TO THE GOVERNMENT OF THE NORTH-WESTERN PROVINCES AND OUDH to the SECRETARY TO THE GOVERNMENT OF INDIA, DEPARTMENT OF REVENUE AND AGRICULTURE.

I am directed to submit, for the information of his Excellency in Council, the accompanying statement showing the death-rate for February in all districts where distress exists or is apprehended. The returns for five districts are still overdue and will be submitted when received.

2. The death-rate in the worst districts only amounts to 58 per mille per annum, and for the distressed districts averages only 38·76. The excess above normal is sufficiently explained by the character of the year.

STATEMENT showing DEATH-RATE in DISTRICTS in which DISTRESS exists or is apprehended during the Month of February 1897, with AVERAGE DEATH-RATE for the previous years of the same Month.

District.	Death-rate of the Month.	Average Death-rate of the Month in Ten previous Years.	Remarks.

No. 784 of 1879, dated Allahabad, the 22nd March 1897.

From the SECRETARY TO GOVERNMENT, North-Western Provinces and Oudh, to the SECRETARY TO THE GOVERNMENT OF INDIA, REVENUE AND AGRICULTURAL DEPARTMENT.

SIR,

I AM directed to submit the monthly Famine Statements A. and B for these Provinces, which give details of the relief operations up to 27th February 1897 in 19 districts officially recognised as distressed. Since the submission of the last report the districts of Fatehpur and Azamgarh have been added to the list, and the prescribed maps for these districts are accordingly submitted. The additional extra-Code Statement C., containing particulars in regard to the districts which were under observation during the period under report, though not officially declared distressed, is also submitted. The entries in columns 11, 12, and 13, Statement B., still seem defective and fail to show the whole of the sums actually advanced or suspended. Further measures have been taken to secure a more complete return.

I have, &c.
T. STOKER,
Secretary to Government, North-Western Provinces and Oudh.

North-Western Provinces and Oudh.

* On test works in portion of district not officially recognised as distressed.

† Village works.

REMARKS to accompany FAMINE STATEMENT A. for the Four Weeks ending 27th February 1897.

Private Relief, Village and Poor-house Relief.

In the distressed tracts private charity is restricted by the poverty of the people, and the restriction is in direct proportion to the acuteness of the distress. In all distressed districts there are local committees under the presidency of the district officer working in connexion with the Indian Famine Charitable Relief Fund. They administer such subscriptions as are locally raised, and such funds as are from time to time allotted by the provincial committee. These latter allotments up to date amount to Rs. 1,56,000 in the North-Western Provinces and Rs. 99,350 in Oudh, and are employed to supplement the State aid.

The system of village relief is in full operation. There was a tendency in some districts to undue extension or contraction of this form of relief; but the necessary steps have in every case been taken to counteract this tendency, which was due chiefly to eccentricities of the native staff, and the arrangements, which are carefully watched by Government, are now working smoothly.

There are a sufficient number of poor-houses in every district, and the management is satisfactory. Outbreaks of cholera in several poor-houses of the Allahabad and Benares Divisions have been successfully treated. In view of such outbreaks measures are taken to keep the poor-house population in the larger institutions as low as possible. Inmates as soon as they become fit to work or travel are drafted to relief works or transferred to the village relief lists.

General Character of Relief Works.

In all districts the large relief works in operation are under the management of the Public Works Department, and consist in the acutely distressed tracts of works conducted under strict Famine Code rules. In some districts where distress is less severe, the intermediate form of works which was devised in this famine to meet the case where relief to dependants is not necessary is in force. These intermediate works are under direct management, *i.e.*, without the intervention of contractors. It is intended to gradually extend the latter system as the demand for field labour increases and the numbers requiring relief are reduced. The number of village works executed through the agency of landholders, by means of partly recoverable advances from Government, has increased. Projects for village works in large numbers are being drawn up and held in reserve in case outbreaks of cholera, or the failure of water supply, or the advance of the hot weather renders it necessary to break up the large works and find employment for the people on smaller and isolated works in the neighbourhood of their homes.

So far as possible, regular relief works under the Public Works Department will be maintained in all the worst districts.

Physical Condition of the People.

The physical condition of the people is reported as generally good in spite of the admitted prevalence of distress among the lower classes. The worst condition is found among the inmates of poor-houses, which attract the wandering beggars and those unfitted for labour by physical defects, and serve to supplement the dispensary or hospital accommodation. The death-rate statistics are being dealt with in separate correspondence. It is sufficient to note here that even in the worst district the death-rate only reaches 58 per mille per annum, while the provincial average is very much lower. The figures indicate that the distress is effectively met by the relief.

Deaths due to Starvation.

Reports of such deaths generally want verification and are shown to be usually erroneous. One wandering stranger in Jalaun is reported to have died from want of food immediately on his arrival at a poor-house.

Food Stocks and Importation of Grain.

Stocks are still sufficient as kept up by importation. They are now receiving an accession from the *rabi* harvest.

General Condition and Prospects of the Affected Area.

The numbers on relief reached their highest point on the last day of the period under report. In some of the earlier districts the advent of the *rabí* harvest had begun to attract away labourers from the works, and this movement has since spread considerably. It is probable that the highest point has been reached, and a substantial fall may be expected while harvest is in operation. But prices still keep unexpectedly high, and the small area of the crops contracts the usual field of employment. High winds which prevailed in the middle of the month have seriously injured the crops in the later sown and unirrigated lands and have somewhat affected even the better fields, thereby causing depression of prices. A return of labourers to relief works may be expected as soon as the harvest is over, and it is feared that the numbers on relief may remain higher than was at one time expected, even the better class of cultivators are themselves doing unwonted work in the fields in order to save the wages of labourers. In the Bundelkhand districts and a few others where the crop failure has been greatest, distress is likely to intensify, and relief operations on a large and increasing scale must be expected till the arrival of the monsoon rains.

North-Western Provinces and Oudh.

BENGAL.

No. 288 Agri. (Famine), dated Calcutta, the 1st February 1897.

From M. FINUCANE, Esq., C.S., SECRETARY TO THE GOVERNMENT OF BENGAL, REVENUE DEPARTMENT, to the SECRETARY TO THE GOVERNMENT OF INDIA, DEPARTMENT OF REVENUE AND AGRICULTURE.

I am directed by his Honour the Lieutenant-Governor to submit herewith a copy of a letter No. A., dated 25th January 1897, from the Commissioner of Patna, with enclosures. Sir W. B. Hudson, K.C.I.E., of Seeraha Factory, Champaran, applies for a loan of Rs. 30,000, which sum he wishes to again advance on mortgage to substantial but temporarily impecunious raiyats connected with his estates for the support of themselves and their families. The Commissioner urges in support of this application that it will be cheaper to adopt this method of relief than to relieve gratuitously the families of the raiyats, and that at the same time the raiyats will be saved from the loss of their holdings. Moreover, there will be no risk to Government, as Sir W. B. Hudson will be entirely responsible for the repayment of the loan.

2. Sir Alexander Mackenzie concurs in this recommendation; and considers that loans made on this principle should be made free of interest, and recoverable at the end of two years. I am therefore to request that the Government of India may be moved to sanction an advance of Rs. 30,000 to Sir W. B. Hudson on these terms, as well as the grant of any similar advances which it may be found desirable to make to other carefully selected zamindars and planters as proposed by the Commissioner in paragraph 4 of his letter.

I am to request that the Lieutenant-Governor may be favoured with a very early reply to this reference.

No. A., dated Camp Darbhanga, the 25th January 1897.

From J. A. BOURDILLON, Esq., Officiating Commissioner of the Patna Division, to the SECRETARY TO THE GOVERNMENT OF BENGAL, Revenue Department.

I have the honour to forward herewith, for the consideration and orders of the Lieutenant-Governor, copy of a letter from the Collector of Champaran (No. 155 F. of the 20th instant), recommending that a sum of Rs. 30,000 may be advanced to Sir W. B. Hudson of Seeraha Factory, to be again advanced on mortgage to substantial but temporarily impecunious raiyats in his *dehat*.

2. I am aware of what happened in 1873-74*, when grain was advanced to raiyats for their subsistence, and to the strong objections that exist to making advances merely for maintenance, one of the strongest being the dimension which the measure may attain if it is once inaugurated.

* *Vide* Famine Commissioner's Report, Part III., paragraphs 88-95.

3. But I consider that in this case the circumstances are special, and for the reasons given, both by Sir W. B. Hudson and Mr. Macpherson, I strongly recommend that the proposal be adopted. In the first place Government will run no risk, as Sir W. B. Hudson is responsible, and I could make the advance in his name only. It is for consideration whether it should be under the ordinary terms of the Agriculturists' Loans Act, or be made without interest on the analogy of loans to be given under the new draft temporary rules of the Land Improvement Act (*vide* your letter No. 76 Agri. of the 31st ultimo). Secondly, as Mr. Macpherson shows, it will be far cheaper to adopt this method of relief than to relieve the families of the raiyats gratuitously. We shall certainly get back this money if advanced to Sir W. Hudson, but even if we lost the whole of it, that would be cheaper than gratuitous relief. Thirdly, the advantage is considerable of saving these raiyats from sinking into abject poverty while their holdings fall into the hands of the banyas. Lastly, the proposal is analogous to, though not identical with, that of granting loans to large zamindars to buy food for their raiyats, which has now been accepted by the Government of India in their letter No. 298 F. of the 20th instant.

4. For all these reasons I strongly support the proposal, and I would ask that orders may be communicated by telegram. I should also like to be informed whether Government would be disposed to grant advances on similar terms in other parts of Champaran and in other districts of the division to carefully selected zamindars and planters.

No. 155 F., dated Motihari, the 20th January 1897.

From the Collector of Champaran to the Commissioner of the Patna Division.

I have the honour to forward herewith a letter, dated the 15th instant, received from Sir William Hudson of Seeraha applying for an advance of Rs. 30,000 to be made to a number of his tenants who, on account of their status, are, he fears, likely to starve to death rather than come on to relief works or publicly solicit relief. The matter, you will remember, was talked over when you and I were at Seeraha last week, and I need not therefore enter into full details now. I have since ascertained from Sir William Hudson that his lists show an average of eight persons in each household, of whom six may be taken as women and children. The census statistics show 7·3 persons per house in thana Dhaka, where Sir William's villages are situated. In consequence of the large size of the families, he considers that Rs. 6 per mensem will be needed for each. He assures me that the Rs. 30,000, for which he is willing to be responsible, will relieve all the families coming under the category referred to in his villages. Assuming that the relief would be for three months, this would give 1,666 families or 13,328 individuals to be relieved. Of these 10,000 persons would be women and children; to relieve these 10,000 under the Famine Code at 1 anna a head for three months would cost Rs. 57,000. Having regard to the probable range of prices, I do not think the cost could be taken at less than that. Under all the circumstances, I beg to recommend that Sir William Hudson's application may be granted under the Agriculturists' Loans Act. He mentions to me that it is now a matter of urgency that many of the families referred to should be relieved, and hopes that early orders will be passed.

Dated Seeraha, the 15th January 1897.

From Sir W. B. Hudson, K.C.I.E., Seeraha, to D. J. Macpherson, Esq., Collector of Champaran.

I believe the Commissioner of Patna and Mr. Glass expressed their approval of the arrangements made by me for gratuitous relief for the two circles comprising my *dehat*, covering 70 square miles, with a population of about 49,000.

2. The Government relief works at present in operation, as you of course know, provide for all those who are able and willing to work for the Famine Code wage.

3. But there is a class whom this form of relief will not reach—the *purda-nashin* women and children of the high caste raiyats—and judging from former experience of famine of 1866 and 1874, these will die in their houses rather than come on the works or publicly solicit relief.

4. It is true that a certain number of these raiyats are so deeply in debt, their holdings being already mortgaged to their full value, that it seems hopeless to attempt to reach their families except by specially organised charitable relief.

5. But there is a large percentage of this class with their holdings unmortgaged, who in consequence of three consecutive bad harvests are now in dire straits and will soon be famine-stricken.

6. The village mahajans, who in ordinary times would come to their assistance, have neither money nor grain in hand to make them advances on the security of their holdings. In the few cases where they have made them small grain advances, they have charged them at the rate of 87½ per cent. for six months' accommodation.

7. They have come to me as their landlord for help, which I consider I am bound to give them.

8. Unfortunately a bad indigo season, and increased expenditure in consequence of the scarcity already experienced, precludes my affording it to them now, and their case will not brook delay.

9. A return prepared for each village shows that a sum of Rs. 30,000 will be required to meet the really urgent cases in this tract of 70 square miles. I am afraid it will be useless to ask Government to advance this on security of their unencumbered lands, from the opinions given me by the Commissioner and yourself on the point.

10. I therefore propose that I should be responsible for the above amount if advanced to raiyats of whom I approve, a list of whose names and holdings will be forwarded to you if sanction is given.

11. I will have the money paid into their hands, will collect it within two years, and make good any losses.

12. The advantages would be—

(1.) The *purda-nashin* women and children would be relieved through their natural protector, the head of the household, and the relief would actually reach them.

(2.) The expenditure would be recouped.

(3.) No establishment required.

(4.) The man would be a respectable tenant, instead of becoming an outcasted pauper.

13. The value of the right of occupancy in this tract is from Rs. 60 to Rs. 120 per acre. I would limit the advance to Rs. 10 per acre.

No. 488 F., dated Calcutta, the 9th February 1897.

From T. W. HOLDERNESS, Esq., C.S., Deputy Secretary to the Government of India, Department of Revenue and Agriculture, to the CHIEF SECRETARY TO THE GOVERNMENT OF BENGAL.

I am directed to acknowledge the receipt of your letter No. 288 Agri. (Famine), dated 1st February, with enclosures, in which a recommendation is made that a loan of Rs. 30,000 should be granted to Sir W. B. Hudson, K.C.I.E., of Seeraha Factory, Champaran, to enable him to make advances to raiyats connected with his estates for the support of themselves and their families.

2. In reply I am to refer the Government of Bengal to the remarks made on this head in the Famine Commission's Report, Part III., pages 142 and 143, and in Part I., page 56. It appears to the Government of India that all the objections to which the advances for subsistence made in the Behar Famine of 1873–74 were open, apply with equal force to the advances which the Commissioner of the Patna Division would now make through the agency of Sir W. B. Hudson. The Government of India cannot accept the view of the Commissioner of the Patna Division that in the present case the objections are deprived of their force by special circumstances. The two great objections to advances for subsistence are that they dispense with tests of distress, and that they offer to an improvident peasantry an irresistible temptation to borrow. These objections are really untouched by the considerations urged by the Commissioner of the Patna Division. If the proposed loan were sanctioned in the present case, a general precedent would be established for all estates under European management; and it would be extremely difficult to refuse to extend the same system

to ordinary zemindari estates under native management. The Government of India are therefore of opinion that it is wiser not to accede to Sir W. B. Hudson's application.

3. I am to remark that if the Commissioner of Patna is satisfied that a case for gratuitous relief by means of loans free of interest or otherwise is made out by these raiyats, he might be advised to apply on their behalf to the Provincial Committee of the Indian Famine Relief Fund.

Agriculture—No. 440 Agri. (Fam.), Calcutta, the 15th February 1897.

From M. FINUCANE, Esq., Secretary to the Government of Bengal, to the SECRETARY TO THE GOVERNMENT OF INDIA, Revenue and Agricultural Department.

Sir,

I am directed to acknowledge the receipt of Mr. Holderness' letter No. 488 F.—86-2, dated the 9th February 1897, in which the Government of India express their opinion upon the recommendation made in my letter No. 288 Fam., dated the 1st February 1897, that a loan of Rs. 30,000 should be granted to Sir W. B. Hudson, K.C.I.E., of Seeraha Factory, Champaran, to enable him to make advances to respectable but temporarily impecunious raiyats connected with his estate for the support of themselves and their families. Sanction was further requested in my letter of 1st February to the grant of similar advances in the future to other carefully selected zamindars and planters.

2. The Government of India, in declining to accede to Sir W. B. Hudson's application, which was supported by the Collector, Commissioner, and this Government, and in implicitly conveying their disapproval of the more general proposal made by the Government of Bengal, refer to the remarks contained in the Famine Commission Report, Part III., pages 142 and 143, and Part I., page 56, and state that in their opinion all the objections to which the advances for subsistence made in the Bihar famine of 1873-74 were open apply with equal force to the advances which it is now proposed to make through the agency of Sir W. B. Hudson. The following are the passages in the Famine Commission Report to which the Government of India refer :—

Extract from Part III., pages 142 *and* 143, *of the Famine Commissioners' Report.*

On the whole, considering the hurry and confusion of the time, the impossibility of investigating the security offered by the applicants and even the fact of their necessity, and the profuse way in which advances were given, or, according to some accounts, forced on the people, it must be admitted that the extent to which they have been repaid is creditable to the honesty and self-respect of the raiyats. But this should not blind us to the danger of the precedent, or to the cost at which this relief was given. The grain advanced cost the Government Rs. 1,45,40,000, and out of this about Rs. 61,00,000 have been recovered, making a loss to Government of Rs. 84,00,000; it cost, therefore, Rs. 21 per head to relieve 400,000 cultivators. If they, including their families, were all in grievous want or in danger of starvation, and if they received relief in no other form, this would be no excessive expenditure; but it is clear from the reports that many of them received relief in other forms also, and that the theory of personal knowledge taking the place of any test to some extent broke down. The cultivators in their turn had to pay a severe penalty for their readiness to apply for advances; if they were forced to sell grain at 30 seers to repay what they had borrowed at 18 seers, they have sold 165,000 tons in order to repay the loan of 95,000 tons. The danger of offering to an improvident people too tempting opportunities for getting advances which they will have to repay at a great sacrifice is one that should be seriously thought of on any recurrence of similar circumstances. * * * *

Extract from Part I., pages 55 *and* 56, *of the Famine Commissioners' Report.*

The suspension of revenue may be an adequate relief to the more substantial landowner, who, when this drain on his resources is removed, has enough left to

struggle through the time of hardship; but it does not entirely provide for the case of the small agriculturist who finds himself without the necessary means either of subsistence or of preparing his lands for tillage, and who, if he is obliged to have recourse to the money-lender, can only obtain a loan on ruinous terms. It is, moreover, desirable that in times of famine reasonable help should be given to landholders to enable them to undertake works on their estates by which employment may be offered to the poorer tenants or labourers. It should, therefore, be the policy of the Government to advance money freely and on easy terms on the security of the land, whenever it can be done without serious risk of ultimate loss. The experience of the Bengal famine of 1874, and other less conspicuous instances, have shown how faithful the landed classes are, as a rule, in repaying such advances, and how inappreciable is the risk attending them when they are judiciously made. The rules under which such advances are given should admit of their being devoted to the purchase of seed grain and bullocks, and to the employment of agricultural labour. They should be made under the general supervision of the Agricultural Department, and when famine has set in, through the inspecting officer in charge of the relief circle. The grant of such loans should be regarded as of primary importance among the measures adopted for meeting distress, and should receive early and sedulous attention on the part of the local Government. No undue pressure should be used to induce the people to accept such loans, nor should they be given unless the applicant is able to show that he is in serious need of such assistance. On the other hand, after these advances have been made, care must be taken not to check the recovery of the country by a too prompt demand for their repayment.

3. I am desired by his Honour the Lieutenant-Governor to submit that the advances to which the Famine Commissioners referred in the first of the above extracts are not analogous to the advances which it was now proposed to make. The Famine Commissioners' remarks upon the evil effects of advances related to advances which in 1873–74 were profusely given, or forced upon the raiyats by Government officers, in order that they might get rid of the excessive quantities of grain which Government had itself imported. These advances, it was said, the raiyats were afterwards compelled to repay at a great sacrifice.

In the present case it was proposed that Government should make advances to landholders of the highest character (such as Sir W. B. Hudson), who have no intention of forcing loans upon an improvident peasantry to be repaid at a great sacrifice. The Famine Commissioners stated that in connexion with the advances which were made on so profuse a scale by Government officers in 1873–74, the "theory of personal "knowledge taking the place of any test (of the necessity for relief) to some extent "broke down." In the present case there can be no danger of such a breakdown. Sir W. B. Hudson knows personally the people to whom he wishes to make the loans; and in selecting other landholders, to whose applications for advances it would be willing to accede, this Government would be careful to choose only those who have a personal knowledge of their tenants and a *bonâ fide* desire to help them in their troubles. Nor is there any danger that the tenants would have to repay the loans at great sacrifice. On the contrary, there is great danger that if they are not helped by their landlords in this way, numbers of respectable tenants, whether they resort to relief works or do not, will be reduced to the condition, as Sir W. B. Hudson says, of "outcasted paupers." Sir W. B. Hudson has been borrowing at high interest to lend to his raiyats, and cannot be expected to continue to do so indefinitely. He has in fact spent already as much as he feels himself warranted in giving. The Famine Commissioners, in pointing out the danger of giving loans such as were given in 1873–74, laid stress on the loss to Government resulting from failure to realise the whole of the amount advanced to cultivators and the consequent expensiveness to the State of such a method of affording relief. In the present instance there is no risk of any loss to Government. On the contrary, this method of giving relief is, so far as Government is concerned, the cheapest that can be imagined. Even in 1873–74 the recoveries of cash loans from cultivators were remarkably good. On the present occasion the loans were to have been given to substantial zamindars who would be responsible for their repayments.

4. The second extract quoted would, I am to submit, appear to point to a conclusion different from that reached by the Government of India. The Famine Commission in that passage refer to the case of the "small agriculturist who finds himself without "the necessary means either of subsistence or of preparing his lands for tillage, and "who, if he is obliged to have recourse to the money-lender, can only obtain a loan

" on ruinous terms ;" and they appear, in the sentences which follow that just quoted, to recommend that advances should be given by Government to landholders, to be again advanced by them to the poor agriculturists whose condition is described. It is true that the Commissioners speak, "*moreover*," of "reasonable help" being given " to landholders to enable them to undertake works on their estates by which employ- " ment may be offered to the poorer tenants or labourers ;" but it cannot be assumed that they intended by these words to preclude help being given to landholders to enable them to make loans to their tenants, by means of which the latter could support themselves without recourse to the money-lender. Without a loan of some kind, it is difficult to see how the cultivators referred to by Sir W. B. Hudson are to live while engaged in preparing their lands, and therefore unable to attend relief works on which the wage, moreover, is so regulated as to give them a mere sustenance only while they are employed on the works, thus providing nothing for them to live on while engaged in preparing their lands.

5. In Mr. Holderness' letter No. $\frac{298}{45-22}$ F., dated the 20th January 1897, the Government of India said :—

"In the Despatch in which they reviewed the Famine Commission's Report, the Government of India wrote: 'The fulfilment of their duties to their dependants by 'large landowners should be strongly insisted on;' and the Secretary of State concurred. It is the duty as well as the interest of large landlords to do all that can be done to assist their raiyats in struggling with the troubles that are before them; and if in any case such a landlord is unable to do his duty in this matter for want of funds, and the Bengal Government is satisfied that the security for repayment of an advance is sufficient, and that the advance will be *bonâ fide* applied to the relief of distress, the Government of India are ready to consider proposals for such advances. They would, however, prefer to give them in general aid of the estate's expenditure on relief, rather than for any specified purpose, such as the purchase of grain."

I am to inquire what class of advances the Government of India had in view in this paragraph. Advances to landlords for the purchase of grain are viewed with disfavour. Advances for the execution of relief works are within the competence of the Local Government, and require no special reference to the Government of India. Advances for the purchase of seed and cattle are similarly admissible under the Agriculturists' Loans Act. The only other class of advance that the Lieutenant-Governor could think of is that which has now been negatived.

6. In their letter under reply the Government of India say :—

"If the proposed loan were sanctioned in the present case, a general precedent would be established for all estates under European management; and it would be extremely difficult to refuse to extend the same system to ordinary zamindari estates under native management."

The Lieutenant-Governor proposed, in my letter of the 1st February, that advances should be made only to carefully selected zamindars and planters; and Sir Alexander Mackenzie would respectfully submit that he and his local officers might have been trusted to see that applicants were selected with that care which the circumstances of the case require. The Lieutenant-Governor regrets that both in their letter of the 4th January, and in their present communication, the Governor of India should attribute to his proposals far-reaching effects which he never contemplated. In the former letter he was described as presenting a blank cheque for the signature of the Governor-General in Council. His last strictly limited proposal is expanded into the creation of a precedent for open loans to any zamindar or planter in Bengal.

7. The Lieutenant-Governor is at a loss to understand the meaning of the suggestion contained in paragraph 3 of the Government of India's letter under reply, that the Commissioner of Patna might apply for loans on behalf of the raiyats of Sir W. B. Hudson and other landlords to the Provincial Committee of the Indian Famine Relief Fund. Apart from the improbability of the Provincial Committee being able to provide funds for the subsistence of cultivators and their families, it appears to his Honour to be altogether impracticable for the Committee to embark on a system of money-lending. That would be an operation which, in Sir Alexander Mackenzie's opinion, is altogether outside their function.

8. In conclusion, I am to say that Sir Alexander Mackenzie considers loans of the kind now applied for to be quite the most unobjectionable form which the assistance of landholders by Government can take, and specially suitable in a Province where

landlords are getting no remission or even suspension of their land revenue; and he desires to press the matter once more on the consideration of the Government of India. It is understood that the Bettiah Raj and other zamindars are awaiting the result of the present application.

9. The Lieutenant-Governor has no desire to dictate to the Government of India, but he feels it specially unfortunate that that Government should find themselves compelled once more to negative proposals which the Lieutenant-Governor, on full consideration and with an intimate personal knowledge of the arrangements of 1873–74, has felt it his duty to put forward. He would not for his part think it necessary on every occasion to be absolutely bound by the suggestions and criticisms of the Famine Commission, though he is generally prepared to bow to their authority; but, as a matter of fact, he believes that he has submitted no proposal up to date which would not have met with their full approval. His Honour, while regretting that the Government of India's reading of the views of the Commission should on any matter differ from his, will of course give effect to any orders which he may ultimately receive.

I have, &c.

M. FINUCANE,
Secretary to the Government of Bengal.

No. $\frac{754}{86-4}$ F., Calcutta, the 8th March 1897.

From T. W. HOLDERNESS, Esq., C.S., Deputy Secretary to the Government of India, to the SECRETARY TO THE GOVERNMENT OF BENGAL.

Dept. of Rev. & Agri.
Famine.

Sir,

I am directed to acknowledge the receipt of your letter, No. 440 Agri. (Fam.), regarding the proposed grant of a loan of Rs. 300,000 to Sir W. B. Hudson, K.C.I.E., of Seeraha Factory, Champaran, to enable him to make advances to tenants on his estate for the support of themselves and their families during the present season of distress. It is stated that his Honour the Lieutenant-Governor is also in favour of granting similar advances to other carefully selected zemindars and planters.

2. The Government of India have given to the proposal the most careful consideration, as they are satisfied that his Honour the Lieutenant-Governor would not have supported the application made in the particular case of Sir William Hudson's estate, nor would have recommended the extension of the same principle of famine relief to other similar estates, were he not of the opinion that by thus aiding the landlords he would be able to relieve in an unobjectionable and an economical manner large numbers of cultivators who otherwise might, on the exhaustion of their resources, be expected to come upon the State for support. If the consideration which they have given to the question lead the Government of India to still doubt the propriety of the method of relief proposed, the grounds of this divergence of opinion must be sought, not in any doubt on their part of the philanthropy and single-mindedness of Sir William Hudson's proposal or of his desire to surround the advances to his tenants with due checks and precautions, but in the rigorous limits which at this present juncture and in view of the great calls upon the public purse they are compelled to set to the methods of famine relief. They say this with the knowledge that his Honour the Lieutenant-Governor is as fully impressed as they are with the necessity for vigilantly scrutinizing all matters of famine expenditure, and that one great merit in his eyes of the proposal under discussion is its economy. But they must look at the proposed method of relief in the light of its ultimate principle; and they find that to accept it would commit them to responsibilities outside the acknowledged scope of famine relief, and beyond their financial capacity.

3. This will appear from an examination of Sir William Hudson's scheme. In describing to the Collector of Champaran the condition of the raiyats on his estate, Sir William Hudson broadly divided them into two groups, one of which he proposed to leave to direct State relief, and the other to assist by means of subsistence advances. The first group comprised the impoverished tenants who could offer no tangible security, who had exhausted their resources, and who were in actual distress. The second group were comparatively well-to-do tenants of high caste with unmortgaged

holdings, who had managed as yet to support themselves, and could still, if through caste prejudices they preferred not to submit themselves to the prescribed test of distress and go on the relief works, raise money on their property in the market, though possibly at usurious rates were it not that the village mahajans have neither money nor grain in hand to make advances. The essence of Sir William Hudson's scheme is to provide these men with a source from which they can borrow at reasonable rates and thus save them from the necessity, on the exhaustion of their borrowing capacity, of coming on the relief works, and so becoming outcast paupers. With these objects the Government of India have, it is scarcely necessary to say, the greatest sympathy; and they fully appreciate the motives of a landlord who endeavours, so far as lies in his power, to keep the holdings of his tenants intact. They are willing to that end to assist in many ways a landlord in the management of his estate and in helping his tenantry, as indeed has been rightly pointed out by the Lieutenant-Governor himself. They are willing to help him to provide his tenants with employment and wages regulated on famine relief principles and with seed grain and cattle at ploughing time. They are also willing to assist him in gratuitously relieving the aged, the infirm, or others who are unable to work, on the same principles on which such relief is distributed under the Famine Code. And they will not object to a portion of any loan that may be made to him being applied to the purchase of grain, subject to the limitation indicated in paragraph 4 of my letter No. 298 of 20th January 1897; though, in order to guard themselves against the suspicion of evading their pledge to abstain from purchase by employing landlords as their agents for the purpose, they would prefer not to advance money for this specific purpose. But when it comes to the question of lending money for subsistence to tenants who are not actually destitute, and who, were they destitute, could work either on improvements on their landlord's estate or on the public relief works, then the Government of India are obliged to say that this is beyond the limits of responsibility for the relief of the people in time of scarcity which they have ever accepted. They also think that it is a mistake to encourage in any way the natural inclination of the raiyat to borrow rather than support himself by labour in an unaccustomed form. On this point they agree with the Government of Bombay in the orders contained in the proceedings of which a copy is enclosed.

3. This statement of the difficulties which the Government of India find in accepting his Honour the Lieutenant-Governor's recommendation will also serve to reply to the question raised in paragraph 5 of your letter under reply. It is there asked to what class of advances did the Government of India refer when in a former letter they said that if a landlord was unable from want of funds to assist his tenants in the present emergencies, and sought an advance from the State for this purpose, they would be ready to consider such a proposal. They had under consideration at the time the case of a landlord wishing to procure food-grain for his tenants. Their meaning would, they admit, have been clearer, had they in the sentence cited below* said "rather than for the specific purpose of the purchase of grain" instead of the words italicised, and I am to express regret that the Lieutenant-Governor has in consequence been led into any misapprehension of their meaning. Other modes of expenditure on relief which the Government of India had in contemplation have been indicated in the preceding paragraph of this letter. But I am to explain that, when Government is asked to make an advance in aid of an estate's expenditure on relief, the relief which the landlord proposes to administer and the distress which he wishes to relieve should broadly fall within, or at any rate should not clearly fall without, the lines of relief and the definition of distress which the State has marked out for itself. The State cannot undertake to relieve persons from the necessity of borrowing in a difficult market, and consequently it cannot make loans to landlords for this purpose.

4. The above remarks will, it is trusted, remove any misunderstanding which may exist as to the intention of paragraph 4 of my letter of the 20th January. The Government of India will leave it to his Honour the Lieutenant-Governor to satisfy himself, in each case in which an application for a loan for the relief of distress among his tenants is made by a landlord, as to whether the proposed method of relief is consistent with the principles laid down in this letter; and to grant or refuse to grant an advance accordingly. A separate reference in each case to the Government of India is not necessary, provided that the probable requirements of the Government

* "They would however prefer to give them advances in general aid of the estate's expenditure on relief, *rather than for any specific purpose, such as the purchase of grain.*"

of Bengal for loans of this kind are first stated and general sanction given to the proposed outlay.

5. In conclusion I am to remark that the Government of Bengal have somewhat misunderstood the suggestion contained in paragraph 3 of my former letter, that if the Commissioner of Patna was satisfied that a case for gratuitous relief by means of loans or otherwise was made out by the high caste raiyats in question and their families, he might apply to the Provincial Famine Relief Fund. The Government of India meant that the application might be for a grant of money, and not necessarily for a loan. It is stated in your letter that the Provincial Committee would not entertain such applications. It does not, however, appear that they have yet been consulted, and if his Honour the Lieutenant-Governor sees no objection, it might be well that they should be given the opportunity of considering the matter.

I have, &c.

T. W. HOLDERNESS,

Deputy Secretary to the Government of India.

Agriculture—No. 447 Agri. (Fam.), Calcutta, the 6th February 1897.

From M. FINUCANE, Esq., Secretary to the Government of Bengal, to the SECRETARY TO THE GOVERNMENT OF INDIA, Revenue and Agricultural Department.

Sir,

I am directed to acknowledge the receipt of your letter No. 447—F./7–3, dated the 6th February 1897, on the subject of estimates of expenditure on famine relief in Bengal, and in reply to submit the following forecast, in which the opportunity has been taken to show the present extent of distress and the probability of its spreading over other tracts.

2. With my letter No. 5259 Agri., dated the 16th December 1896, reporting on famine relief in the Patna Division, and on the prospects of corps and probability of distress in the other divisions of Bengal, a Memorandum, drawn up by Mr. Bourdillon, was submitted for the information of the Government of India, showing the numbers which were then considered likely to need relief in the Patna Division, and the probable cost of relieving them. This estimate did not, however, include various items of famine relief administration. Mr. Bourdillon, therefore, subsequently revised it on the 21st December 1896. A copy of the later Memorandum is herewith enclosed for the information of the Government of India. When it was drawn up relief operations had only recently been commenced in the Patna Division, and the situation in other Divisions was not such as to render it possible for any forecasts to be prepared of the areas and the numbers likely to be affected, and of the probable expenditure on famine relief under different heads. Another estimate, dated the 19th January 1897, has therefore been obtained from the Commissioner of the Patna Division, and I am directed now to submit a copy of it, together with a tabular statement showing the requirements of that and other divisions of Bengal. The figures in this statement are based on the estimates furnished by local officers which, after such modification as Government was, with the information then before it, able to make, were sent to the Accountant-General, Bengal, on the 20th January 1897. These are the figures referred to in your letter of the 6th instant above quoted. Alterations necessitated by later information are now made in them. In revising the estimates submitted by the local officers, the Lieutenant-Governor has kept in view the desire of the Government of India to be informed of only the least amounts that are probable, and not the maximum possible amounts likely to be required.

3. It has not been found possible to divide the estimates now submitted under the several heads laid down in paragraphs 5 and 6 of the Finance and Commerce Department Resolution No. 5299 A., dated the 16th December 1896. The three main heads of the present estimates approved by the Lieutenant-Governor are as follows:—

(*a.*) *Relief Works and gratuitous Relief.*—The requirements of the Patna Division have been estimated by Mr. Bourdillon in the manner shown in his Memorandum, dated the 19th January 1897, by taking the total number of persons to be relieved for one day and multiplying it by the estimated average cost per head per diem. This estimate, therefore, represents the anticipated expenditure on gratuitous relief, and relief works to be conducted by the Public Works Department as well as by civil

officers. In the accounts the actual expenditure incurred will be shown under respective heads, as required by the Finance and Commerce Department Resolution above quoted.

(*b.*) *Advances for Village Relief Works.*—These advances are to be given without interest under the modified rules under the Land Improvement Loans Act, XIX. of 1883, a copy of which was submitted to the Government of India with my letter No. 126 Fam., dated the 16th January 1897. The works on which these advances are to be spent will consist of the excavation of tanks and other petty village works intended to give employment to labourers who would otherwise come on to the Government relief works, and it is provided in the rules that if the work is carried out to the satisfaction of the Collector, one-third of the advance will be remitted.

(*c.*) *Bounties for digging Wells.*—The amount entered under this head refers to the contribution of one rupee for each *kutcha* well, sanctioned in paragraph 12 of this Government's Resolution No. 5133 Agri., dated the 10th December 1896, and is now put down at one lakh of rupees for the Patna Division. Small sums have been provided under this head for certain other divisions in the present estimates.

The estimate of the local officers include another head, viz., advances for grain and cattle, the total amounts provided under which are Rs. 97,000 for 1896-97 and Rs. 13,72,000 for 1897-98. Such advances are given under the Agriculturists' Loans Act. XII. of 1884, and provision for them ought to be made in the ordinary Loans Budget: but that budget, so far as the Bengal Government was concerned, having been closed, a provision of Rs. 10,00,000 (ten lakhs) made for the Patna Division under the head in question, was included in the estimates furnished to the Accountant-General on the 20th January. A reference on this subject will be made to the Board of Revenue, Lower Provinces, and if it is found necessary to provide any amount in excess of the provisions already made in the Loans Budget to meet the requirements of distressed tracts, a further application will be made to the Government of India.

The following paragraphs deal with the estimates of each division separately.

4. *Patna Division.*—Mr. Bourdillon's estimate relates to the four districts of North Bihar, where failure of crops has been greatest, and the consequent distress is most widespread. In South Bihar prospects in the district of Gaya continue excellent, and distress is not at present apprehended in that district. In Patna an area of 229 square miles, with a population of 420,000 persons, is still regarded as affected by scarcity, and distress has lately been declared to exist in an area of 400 square miles, with an estimated population of 11,500 persons in the Bhabhua subdivision of the district of Shahabad, although the recent rainfall, amounting to ·35 inches, is reported to have materially improved the prospects of the *rabi* crops. In Shahabad two other areas aggregating 280 square miles, with a total population of 29,000, in the Sasaram subdivision, are likely to be affected. On the whole, the Lieutenant-Governor thinks that any relief operations which may be found necessary in the districts of Patna and Shahabad will not be on such a scale as to require the provision of funds by Government other than what is provided for North Bihar. The District Boards are in a position to meet the greater part of the cost under the head of relief works in these districts.

5. As regards North Bihar, Mr. Bourdillon, in his first Memorandum, submitted to the Government of India with my letter No. 5259 Agri., dated the 16th December 1897, following the principles laid down in the Famine Commission's Report, estimated the numbers likely to require relief gratuitously and on relief works by taking 8 per cent. of the total population of the areas affected or likely to be affected, except in the case of Champaran, for which he reduced the percentage to 5. On this basis he estimated the numbers to be as follows:—

District.	December.		January.		February.		March.		Total Numbers for the Four Months in Terms of One Day
	Daily Number.	Total Number for the Month.	Daily Number.	Total Number for the Month.	Daily Number.	Total Number for the Month.	Daily Number.	Total Number for the Month.	
1.	2.	3.	4.	5.	6.	7.	8.	9.	10.
Saran - -	—	—	53,266	1,597,980	53,266	1,597,980	53,266	1,597,980	4,793,940
Champaran - -	13,570	407,100	53,036	1,591,080	66,118	1,983,540	66,118	1,983,540	5,965,260
Muzaffarpur - -	—	—	132,800	3,984,000	132,800	3,984,000	132,800	3,984,000	11,952,000
Darbhanga - -	—	—	137,600	4,128,000	137,600	4,128,000	181,200	5,436,000	13,692,000
Total -	13,570	407,100	376,702	11,301,060	389,784	11,693,520	433,384	13,001,520	36,403,200

From April to the end of September the total numbers, given in Mr. Bourdillon's Memorandum, were as follows:—

	Daily Number.	Total Numbers for the Six Months in Terms of One Day.
Saran	53,266	9,587,880
Champaran	73,463	13,223,340
Muzaffarpur	161,028	28,985,040
Darbhanga	196,000*	34,836,000
Total	483,757	86,632,260

Taking one anna per head per diem as the probable cost, he estimated the total cost in round numbers from December 1896 to September 1897 at Rs. 76,90,000. His first estimate was for relief works and gratuitous relief, and, as already observed, did not include any other items.

In his second Memorandum of 21st December 1896, Mr. Bourdillon proceeded on the same principles, and estimated the total cost of relief works and gratuitous relief at Rs. 77,70,000, the difference of Rs. 80,000 between this and the previous estimate being due to the area likely to be affected in Saran having been raised from 766 to 880 square miles, and the daily numbers from 53,266 to 58,376. In his second Memorandum Mr. Bourdillon submitted estimates under three additional heads as noted below,† which, added to the estimate for relief works and gratuitous relief, brought the total estimated cost of famine relief in the Patna Division up to Rs.94,70,000.

In his third and final Memorandum, dated the 19th January 1897, the estimates of numbers have been made on the assumption that the features of the famine of 1873-74 will repeat themselves. The actual numbers on relief works during that year have been taken month by month, and the ratios which they bore to the population of the district and to the total relieved have been applied to the population of the present day. But as relief was overdone in 1873-74, an allowance based on conjecture has been made in the case of each district, and to the figures thus reduced 20 per cent. has been added as representing the numbers likely to require gratuitous relief. In the case of Champaran, Mr. Bourdillon adds that, on further consideration, he thinks that his first estimate (framed on the basis of 5 per cent. of the total population) was too low.

The following comparative statement shows the numbers relieved and the expenditure incurred in North Bihar in 1873-74, and the estimates for the present season, as previously and now submitted by the Commissioner:—

District.	Numbers in Terms of One Day.			Expenditure.				
	Relieved in 1873-74.	Previous Estimate by the Commissioner.	Present Estimate by the Commissioner.	In 1873-74.	Previous Estimate by the Commissioner.	Present Estimate by the Commissioner.		
						Financial Year 1896-97.	Financial Year 1897-98.	Total.
1.	2.	3.	4.	5.	6.	7.	8.	9.
				Rs.	Rs.	Rs.	Rs.	Rs.
Saran	35,647,284	14,381,820	25,000,000	31,53,939	8,98,863	3,12,500	12,50,000	15,62,500
Champaran	17,187,600	19,188,600	25,000,000	16,80,966	11,99,287	4,90,375	11,72,125	16,62,500
Muzaffarpur	39,970,772	40,937,040	35,000,000	26,81,372	25,58,565	4,37,500	17,50,000	21,87,500
Darbhanga	78,743,304	48,528,000	60,000,000	61,64,319	30,33,000	10,37,500	28,12,500	38,50,000
Total for relief works and gratuitous relief.	171,548,960	123,035,460	145,000,000	1,36,30,596	76,89,715	22,77,875	69,84,625	92,62,500
Advances for village works.	—	—	—	—	—	3,00,000	5,00,000	8,00,000
Advances for grain and cattle.	—	—	—	—	—	—	10,00,000	10,00,000
Bounties for wells	—	—	—	—	—	1,00,000	—	1,00,000
Grand total	—	—	—	—	—	26,77,875	84,84,625	1,11,62,500

* 1,81,200 for six months from April to September - - 32,616,000
14,800 from May to September - - - 2,220,000
34,836,000

† (1.) Advances for village works Rs. 5,00,000
(2.) Advances for grain and cattle - 10,00,000
(3.) Bounties for digging wells - 2,00,000

The Commissioner's present estimates, based on the assumption that relief will be required till the end of September at 1 anna per head per diem, show an increase of about 2,000,000 in the total number of persons to be relieved for one day, and of about Rs. 15,73,000 in the total estimated cost of relief works and gratuitous relief. Mr. Bourdillon, however, observes that if the outturn of the *rabi* crop is good and if the monsoon rains fall early and are seasonable, the numbers on relief works and gratuitous relief will fall rapidly from the end of June, and may not increase much after the 1st April. The figures, shown in column 4 of the table above, are therefore intended by the Commissioner as outside figures.

6. The following table shows the actuals of numbers and cost under the head of relief works and gratuitous relief for the months of December and January:—

District.	Numbers in Terms of One Day.			Cost.		
	December 1896.	January 1897.	Total.	December 1896.	January 1897.	Total.
1.	2.	3.	4.	5.	6.	7.
				Rs.	Rs.	Rs.
Saran - -	27,509	303,854	331,363	1,860	23,903	25,763
Champaran -	380,318	2,458,608	2,838,926	24,753	1,53,638	1,78,391
Muzaffarpur - -	3,117	200,956	204,073	650	13,954	14,604
Darbhanga - -	108,353	2,456,575	2,564,928	6,903	1,50,424	1,57,327
Total - -	519,297	5,419,993	5,939,290	34,166	3,41,919	3,76,085

It will be observed that the actual numbers in Champaran are far in excess of the Commissioner's estimates given in the first table in paragraph 5 above, while in Saran, Muzaffarpur, and Darbhanga they are, for January, far less. The total actual numbers for the two months, December and January, in terms of one day, amount to 5,939,290, against 11,708,160, as estimated in Mr. Bourdillon's first Memorandum, and the actual cost is Rs. 3,76,085, against Rs. 7,31,760, arrived at according to his estimate.

The following table shows approximately the daily numbers on relief works and gratuitous relief in the four northern districts of Bihar in 1873–74, month by month from December, and the corresponding numbers for the months of December, January, and February of the present year:—

NUMBER shown in THOUSANDS.

District.	December.		January.		February.		March.	April.	May.	June.	July.	August.	Sept.	Remarks.
	No. in 1873-74.	Average for the Month in the current Season.	No. in 1873-74.	Average for the Month in the current Season.	No. in 1873-74.	Actual Number on 6th February 1897.	No. in 1873-74.	No. in 1873-74.	No. in 1873-74.	No. in 1873-74.	No. in 1873-74.	No. in 1873-74.	No. in 1873-74.	
1.	2	3.	4.	5.	6.	7.	8.	9.	10.	11.	12.	13.	14.	
Saran - -	—	1	20	10	87	29	107	167	200	229	148	119	106	The Champaran figures for 1873-74 do not include the numbers on gratuitous relief, as they are not clearly given in the records.
Champaran -	5	13	12	82	25	116	53	83	160	80	73	9	2	
Muzaffarpur -	1	1	1	7	13	22	65	182	345	329	173	137	53	
Darbhanga -	—	4	3	82	45	189	251	576	665	440	258	256	121	
Total -	6	19	36	181	170	356	476	10,08	13,70	10,78	652	521	282	

It will be observed that the numbers in December, January, and February of the present year are far in excess of the numbers for the corresponding months of 1873–74, the actual numbers in receipt of Government relief on the 6th of February being 356,000, against 170,000 in February 1874. If the numbers should increase in the coming hot weather and rains in anything like the same proportion as they did in 1873–74, when in May they reached a maximum of 1,370,000, and were more than eight times those of February of that year, they in May of the present year would be overwhelming, being 2,850,000, and for the subsequent months would be as follows:—

June - - - -	2,136,000
July - - - -	1,424,000
August - - -	1,068,000
September - - -	712,000

Mr. Bourdillon, in his Memorandum of 21st December 1896, estimated the maximum numbers in May and subsequent months at 489,000.

Looking to the present numbers and those of 1873–74, and having regard to the facts that the extent of crop failure in the present year closely approximates to that of 1873–74, that prices are higher, and that the *rabi* crop of 1874 was a fairly good one, though not as good as that of the present year is expected to be, and that the population has largely increased since 1873–74, the Lieutenant-Governor can feel no assurance that Mr. Bourdillon's figures will not be largely exceeded. Inasmuch as the pinch of distress was, owing to high prices, felt this year at an earlier period than in 1873–74, and as, on that account, a larger proportion of those who are likely to feel the distress will probably have come on to relief works at an earlier period than in the year 1873–74, his Honour hopes that the numbers in March and April and subsequent months will not increase in anything like the same proportion as in 1873–74. The numbers in Saran may continue to be moderate, but a large increase is inevitable in Champaran and Darbhanga, and particularly in Muzaffarpur. Sir Alexander Mackenzie hopes, however, that the daily numbers on relief works and gratuitous relief in the four districts, taken together, may not exceed those shown below:—

February	400,000
March	500,000
April	600,000
May	750,000
June	600,000
July	400,000
August	300,000
September	200,000

Estimating on this basis for the coming months, taking the actuals up to the end of January, and allowing $1\frac{1}{3}$ annas, the rate given in your present letter as the probable average cost per head, the estimates for the two years excluding the cost of establishments, &c., stand as follows:—

1896–97.

	Rs.
Actual expenditure up to the end of January in round numbers	3,76,000
Total numbers in terms of one day for February and March— 2,67,00,000 * at $1\frac{1}{3}$ annas per head	22,25,000
Total	26,01,000

1897–98.

Total numbers in terms of one day from April to September— Rs. 8,69,50,000 † at $1\frac{1}{3}$ annas per head, in round numbers	72,46,000
Grand total	98,47,000

As the numbers above given are the estimated total numbers likely to be on relief works or on the gratuitous relief lists, the estimated cost includes the advances to be given for village relief works undertaken by private individuals, which will employ labourers who would otherwise come on to the Government relief works. It being anticipated that a sum of Rs. 1,74,000 this year and Rs. 2,85,000 in 1897–98 will be

* February	4,00,000 × 28 =	1,12,00,000
March	5,00,000 × 31 =	1,55,00,000
Total		2,67,00,000
† April	6,00,000 × 30 =	1,80,00,000
May	7,50,000 × 31 =	2,32,50,000
June	6,00,000 × 30 =	1,80,00,000
July	4,00,000 × 31 =	1,24,00,000
August	3,00,000 × 31 =	93,00,000
September	2,00,000 × 30 =	60,00,000
Total		8,69,50,000

available from the funds of the District Boards, the net expenditure to be borne by Government in the Patna Division as above estimated is—

1.	1896–97. 2.	1897–98. 3.	Total. 4.
	Rs.	Rs.	Rs.
Relief works and gratuitous relief - - - -	21,27,000	64,61,000	85,88,000
Advances for village works - - - -	3,00,000	5,00,000	8,00,000
Bounties for wells - - - - - -	1,00,000	—	1,00,000
Total - -	25,27,000	69,61,000	94,88,000

7. With regard to the Patna Division, it is observed in paragraph 3 of your letter that the numbers on gratuitous relief in Darbhanga * on the 23rd January 1897 were very large in comparison with the numbers on relief works, and seem to show that the absence of a work test and inaccurate classification reported as existing in this district in my letter No. 118 Fam., dated the 15th January 1897, have not yet been remedied, and that so long as such conditions exist, an increasing number of admissions does not necessarily show increasing distress. The Lieutenant-Governor does not think that the temporary disorder which was inevitable in the beginning of the operations, arising from the fact that numbers rushed to relief works far in excess of those of 1873–74, can be taken to indicate absence of distress, for the figures below, subsequently reported, do not show any great reduction in the proportion of the numbers relieved gratuitously.

1.	On Relief Works. 2.	On gratuitous Relief. 3.	Per-centage of Column 3 to Column 2. 4.
30th January - - - - - -	135,644	55,283	40
6th February - - - - -	122,276	66,496	54

The numbers on gratuitous relief in Darbhanga are larger than elsewhere, because the organisation for the preparation of village lists was in a more advanced state, because children and weakly persons, who are properly entered on the gratuitous relief lists, were not allowed to be entered as workers when they were unable to do any real work, and also because the local officers, owing to the rush on relief works, were unable to scrutinise the relief lists as closely as they would wish. But the percentage on gratuitous relief in Darbhanga, although large, does not appear from the following figures, published in the "North-Western Provinces Gazette" of 30th January and 6th February, to be larger than the proportion of gratuitous relief to relief works in those provinces:—

1.	Relief Works. 2.	Other Heads. 3.	Per-centage of Column 3 to Column 2. 4.
Week ending 27th January - - -	618,355	333,894	54
„ 3rd February - - -	729,298	407,698	56

It appears to the Lieutenant-Governor that the amount of task work exacted, and the rate of wage allowed on relief works, are the real tests of distress. Sir Alexander Mackenzie has been unable to obtain information as to the tasks exacted and the rates per thousand cubic feet of earthwork allowed in other provinces; but his Honour observes that the rates in Bihar, even at the worst period when discipline was at its weakest, compare not unfavourably with those attained in Bundelkhund last year

	On Relief Works.	On gratuitous Relief.
* Darbhanga - - - - -	103,581	51,534

where there was no doubt of the acuteness of distress, and relief works were admittedly well managed. The comparative figures stand thus:—

Bundelkhund:—

Works under the Public Works Department—

Earthwork on roads	- - -	Rs. 11 per 1,000 c. ft.
,, tanks	- - - -	5·40 ,, ,,

Works under district officers—

Chota Nagpur Division.—Palamau.—Since the date of this Government's last report on famine relief operations, No. 118 Fam., dated the 15th January 1897, paragraph 15 of which dealt with the Chota Nagpur Division, further communications have been received from the local officers, which have materially altered previous anticipations. Distress has shown itself in the district of Palamau, and it is reported that the whole district, comprising 4,912 square miles, with a total population of 596,770, will be affected. It has also been reported that there are signs of failure of the local food supply. The district is at a great distance from railways, and amongst the local traders there are no substantial men who are able or accustomed to import grain from Calcutta or elsewhere. Efforts have been made by the local officers to induce traders in adjoining districts and Calcutta to send grain to Palamau, which, however, have not yet met with much success. A separate letter on this question has been submitted for the orders of the Government of India.

The Deputy Commissioner estimates that 8 per cent. of the population may come to relief works for seven months from February to August, and that the cost will be Rs. 1,20,000 in the present and Rs. 5,10,000 during the following year. For advances for village works he estimates that Rs. 50,000 will be required this, and one lakh next, year, and Rs. 1,000 for bounties for wells; total Rs. 7,81,000. The Commissioner hesitates to reduce this estimate, but hopes that the expenditure will not amount to more than one-half, or at most, two-thirds of the Deputy Commissioner's estimates, under the head of gratuitous relief and relief works. The Lieutenant-Governor agrees with the Commissioner in thinking that the Deputy Commissioner's estimates are excessive. The total cash expenditure in Palamau in 1873–74 amounted to only Rs. 2,03,000. It is impossible with the data available to form anything like an accurate estimate of expenditure. The reported crop outturns are not so bad as in 1873–74, and the numbers at present on relief works, and in receipt of gratuitous relief are, according to a recent report, only 1,700 against 5,000 in the corresponding period of 1873–74. The numbers never rose beyond 25,000 in 1873–74. Assuming that the food supply in the district does not fail, or that any deficit there may be is supplied under the stimulus suggested in a separate letter No. 381 Fam., dated the 11th February 1897, and that the numbers are not artificially swollen by difficulties in procuring grain elsewhere than on Government relief works, the Lieutenant-Governor thinks that the number for the present month may be taken at 2,500, for March at 5,000, and for the months of April to July at 10,000. On this basis the estimated expenditure on relief works and gratuitous relief would be about Rs. 15,000 this year and Rs. 75,000 in 1897–98; to this being added Rs. 25,000 for subsidies to stimulate importations, the total estimate will stand at Rs. 1,15,000. The Lieutenant-Governor accepts the Commissioner's estimates under the head of "Advances for village works" and bounties for wells, except that he would reduce the amount provided under the former head from Rs. 50,000 to Rs. 25,000 for 1896–97. The district board will provide Rs. 15,000 in this and Rs. 10,000, next year, so that the net outlay by Government is estimated at Rs. 50,000 and Rs. 1,66,000 during the two years respectively.

Singhbhum and Lohardaga.—As regards the other districts, except Singhbhum, which is still considered safe, much depends on the success of the *mahua* fruit crop. In Lohardaga scarcity may be felt in a tract known as the Panch Parganas, comprising an area of about 600 square miles, on the eastern edge of the district adjoining Manbhum, with a population of about 120,000. It is reported that the people of the tract are having recourse in an unusual degree to the use of jungle fruits, &c. The population is sparse, and there are extensive forests which constitute a large resource to fall back upon. The Lieutenant-Governor does not think that it will be necessary to provide for any expenditure by Government in this district.

Hazaribagh.—In Hazaribagh the local officers think that if the *mahua* crop fails, one-third of the district, which has an area of 7,021 square miles and a population of 1,164,000, will at once be in a state of famine, but the present estimate for this crop is only something below the average. Apart from this, the high prices, coupled with a short winter rice crop, will probably render relief measures necessary in the thanas noted below.* In parts of these thanas the winter rice crop was not above five annas, and the Deputy Commissioner thinks that an area of 1,100 square miles, with a population of 140,000, will need relief. For similar reasons tracts in other thanas, aggregating 650 square miles, with a population of 60,000, are considered likely to require assistance, but to a slighter extent. In 1873–74 the total expenditure incurred in this district was, in round numbers, Rs. 1,41,000 in charitable relief and wages on relief works, and Rs. 1,27,000 in loans. On the present occasion the Deputy Commissioner states that the necessity for regular relief measures has not yet been fully proved, but thinks that it will be advisable to provide for the relief of an average of 10,000 persons from 15th April to 15th August, and he estimates the cost of relief works and gratuitous relief at Rs. 1,00,000 at the outside, of which Rs. 30,000 will be supplied by the district funds. He also estimates that Rs. 50,000 will be required this year and Rs. 50,000 next year for loans. Having regard to the high prices and the comparatively isolated position of the district, the Commissioner, Mr. Forbes, is inclined to take a more serious view of the position. The Lieutenant-Governor is disposed to think that the district funds will suffice to meet the wants of the district for relief works, and that Rs. 25,000 this year and Rs. 25,000 next year will be enough for loans for village works.

Manbhum.—In my letter of 15th January 1897, it was stated that there was no reason for any apprehension for Manbhum. There can be no doubt that this district is in a much better position now than in 1873–74, although in that year the *mahua* crop gave a very abundant outturn; but it is reported that one-fourth of the population subsists on the earnings of unskilled labour, and, as these people have no stocks in hand, they will suffer from the high prices now prevailing. Moreover, the outturn of the winter rice, according to a revised estimate, averaged about five annas in thanas Gobindpur, Tundi, Nirsha, Chas, and Chandil, comprising 1,280 square miles, with a population of 361,000 persons. With the exception of thana Chandil, this area includes the greater part of the tracts affected in 1873–74. In that year the total expenditure incurred by Government was 14½ lakhs. The present Deputy Commissioner, Mr. Luson, is of opinion that if the *mahua* crop fails, two-thirds of the district, with a population of about 800,000 will be affected; and taking 8 per cent. as the proportion likely to need relief, and five months as the period of relief, he estimates the cost at five lakhs for relief works and gratuitous relief, two lakhs for advances for village works, and two lakhs for wells. Mr. Luson adds that if the *mahua* crop is a thoroughly good one, these estimates may be reduced by one-half under each head. There is no reason to think that the *mahua* crop will not be a good one, and the Lieutenant-Governor does not apprehend distress on an extensive scale in Manbhum. The district funds available will probably suffice for relief works in the present year, and his Honour is inclined to think that an allotment of one lakh for relief works and gratuitous relief next year, and of Rs. 10,000 this year and Rs. 73,000 next year for advances for village works, will be sufficient for this district.

It will thus be seen that the local estimates of the money required from Government for this division have been reduced from Rs. 19,41,000 to Rs. 4,50,000.

9. *Presidency Division.*—The districts of the Presidency Division, in which distress exists, are Khulna, Nadia, and Jessore.

Khulna.—The worst tract in the district of Khulna comprises thanas Asasuni, Magura, and Kaliganj in the Satkhira sub-division, and a portion of thana Paikgacha

* Barhi, Bagodar, Dumri, Chauparan, Koderma.

in the Sadar sub-division. The area now affected is 442 square miles, with a population of 262,000 persons, in which relief operations have been in progress since the 16th December 1896; and in an area of 60 square miles, with a population of 46,000, in thanas Satkhira and Magura, distress is apprehended from the middle of March. To these must be added an area of 201 square miles, with a population of 96,000, in thanas Mollahat and Morelganj of the Bagerhat sub-division, where distress requiring relief measures is considered likely to appear after the close of the current financial year and to continue till September. In the Satkhira and Sadar tract there are practically no *rabi* and *bhadoi* crops, and the local officers think that relief will be required up to the middle of November 1897. Assuming that 8 per cent. of the population will have to be relieved by Government, and the average cost per head per diem will be one anna, the local officers have estimated the total cost of relief works and gratuitous relief at Rs. 5,76,000. Having regard to the fact that, although relief operations are reported to have commenced in the middle of December, the numbers hitherto on relief works and gratuitous relief have been small, and that from the commencement of the rains the numbers will probably diminish, his Honour is of opinion that, for this tract, the District Board Funds will be able to meet the requirements of the present and next year for relief works and gratuitous relief, and that Rs. 50,000 this year and Rs. 50,000 next year will be sufficient for advances for village works.

Nadia.—In the district of Nadia a total area of 528·5 square miles was affected in 1873–74, and the expenditure in grain and cash was:—

	Rs.
Grain 863 tons, at Rs. 110 per ton - -	94,390
Cash - - - - - -	3,15,374
Total - -	4,09,764

During the present year the whole of the Kaliganj thana and parts of eight other thanas,* with a total area of 1,076 square miles, are likely to be affected. Allowing for the stricter system now in force, the Lieutenant-Governor thinks that, as the area is more than double the distressed area in 1873–74, the expenditure on relief will probably be larger. The total cost estimated by the local officers under this head is Rs. 5,84,000. A sum of Rs. 50,000 has already been granted, and the Lieutenant-Governor hopes that for the present this amount will be more than sufficient, and that one lakh will suffice for relief works and gratuitous relief and half-a-lakh for advances for village works for 1897–98.

Jessore.—Distress has already made its appearance in a tract of about 106 square miles in thanas Mahammadpur and Magura, in the district of Jessore. Another tract of about 168 square miles in thana Bangaon will, it is reported, shortly be in a similar condition. The total estimate of the local officers under the head of Relief Works and Gratuitous Relief is Rs. 1,18,000 (Rs. 48,000 in 1896–97 and Rs. 70,000 in 1897–98), out of which Rs. 19,000 will be provided by the District Board. The Lieutenant-Governor is of opinion that the District Board should be able to provide all that is needed for relief works, and that Rs. 10,000 divided equally between the two years will suffice for advances.

24-*Parganas and Murshidabad.* — Of the remaining districts in the Presidency Division, the Lieutenant-Governor considers the 24-Parganas to be safe so as to require no provision of funds by Government. In the district of Murshidabad there is some probability of distress, especially in the tract which borders on the affected area in the north-west of the district of Nadia. But the estimates of the local officers, given in the statement annexed, and amounting to Rs. 3,70,000, for relief works, gratuitous relief, and advances for village works, seem to the Lieutenant-Governor to be out of all proportion to the probable requirements of the district. Actual relief operations are not considered likely to be required until the beginning of the next financial year. The District Board is reported to be able to provide Rs. 40,000, and a lakh of rupees will be expended through the Public Works Department on the Bhagwangola retired line of embankment. His Honour does not think it necessary to make any further provision under this head. The Collector asks Rs. 40,000 for advances for village works. The Lieutenant-Governor thinks Rs. 10,000 might be provided for this and Rs. 30,000 for next year.

* Nakashipara, Teyhatta, Chapra, Meherpur, Gangni, Karimpur, Daulatpur, Nowpara.

10. *Orissa Division.*—The estimates as submitted by the Commissioner are shown in the accompanying tabular statement, but he states that he himself has little faith in the figures furnished. The failure of the crops and the high prices render it certain that there will be distress more or less acute in parts of the division, but no actual distress has yet made its appearance, and there are no sufficient data for the preparation of any reliable estimates of the numbers to be relieved and the cost to be incurred. The Commissioner reports that in Angul and Balasore there will be little more than local scarcity in small isolated areas. In Cuttack distress will, it is thought, begin to manifest itself in March, and will continue till September, when the beali or early rice crop is reaped; but from the commencement of the rains most labourers will find employment on ordinary agricultural operations. Puri is the worst district in Orissa, and it is reported that cases of distress have already come to the notice of local officers. In the great Orissa famine of 1866, this was the district where distress first made its appearance in the neighbourhood of the Chilka Lake. The following comparative table shows the estimates communicated by this Government to the Accountant-General, and those since received from the Commissioner:—

	As communicated to the Accountant-General, Bengal.		Estimates now received from the Commissioner.	
	1896–97.	1897–98.	1896–97.	1897–98.
1.	2.	3.	4.	5.
	Rs.	Rs.	Rs.	Rs.
Relief works and gratuitous relief:—				
To be met by Government - - -	14,000	4,04,000	73,000	9,21,000
„ „ the District Boards - - -	78,000	13,000	80,000	92,000
Advances for village works - - -	50,000	1,69,000	—	1,00,000
„ „ grain and cattle - - - -	—	—	—	2,00,000
Bounties for wells - - - -	—	—	—	—
Total - - -	1,42,000	5,86,000	1,53,000	13,13,000

The Lieutenant-Governor is of opinion that the estimates of the local officers are excessive. The District Boards have a sum of Rs. 80,000 available for relief works in the present year and Rs. 92,000 in the year 1897–98. The Lieutenant-Governor thinks that it will, for the purposes of budget estimate, be sufficient to provide one lakh for relief works and gratuitous relief in 1897–98 and one lakh for advances for village works.

11. *Bhagalpur Division.—Sonthal Parganas.*—No distress has yet made its appearance in any of the districts of the Bhagalpur Division. But prices are very high, and there can be little doubt that the poorer classes will soon feel the pinch of distress. The requirements in Purnea, Malda, and Monghyr should, in his Honour's opinion, be fully met by such measures as the District Boards are able to take. In the Sonthal Parganas there is no District Board, and distress is likely to be more widespread there than in the other districts above named. The Lieutenant-Governor does not, however, think that relief operations will be necessary before the end of March, when the Commissioner apprehends a sudden outbreak of distress as in 1873–74. His Honour is not inclined to accept the provision of Rs. 6,000 made by the local officers for the current year; nor does he consider it necessary to provide funds in the present estimates for the grant of advances in this district. An allotment of Rs. 1,00,000 for relief works and gratuitous relief during 1897–98 will, Lieutenant-Governor hopes, be sufficient, and for advances for village works he would provide Rs. 10,000 in the present and Rs. 30,000 in the following year.

Bhagalpur.—In the district of Bhagalpur the total area threatened with scarcity is 1,110 square miles with a population of about 609,500 persons. With the exception of 150 square miles in the Colgong thana south of the Ganges, the whole of the threatened area, comprised in the Madhipura and Supaul sub-divisions, lies on the north of the Ganges. Taking 5 per cent. of the total population as the proportion likely to need relief, the Collector estimates 30,475 as the number to be provided for. In the Supaul sub-division a test work has recently been opened, but is not largely attended. It is generally estimated that there will be no need of real relief works until March;

and assuming that relief will be required up to the end of September, the Collector (Mr. McIntosh) arrives at 3,270,000 as the total number to be relieved in terms of one day. The total estimated cost of gratuitous relief and relief works at one anna per head per diem is Rs. 2,04,000, of which Rs. 15,000, to be provided by the District Board, are for the current year, and the remainder, Rs. 1,89,000, for 1897–98, out of which Rs. 50,000 will be available from the Board's funds. Having regard to the fact that in the threatened tracts there are several estates belonging to wealthy landholders who have expressed their willingness to undertake relief measures, the Lieutenant-Governor does not think it necessary for Government to make budget provision for more than a lakh of rupees in 1897–98. The estimates of the local officers also provide Rs. 10,000 for the current year and Rs. 60,000 for 1897–98 for advances for village works. The Lieutenant-Governor accepts the local officers' estimates under this head.

12. *Rajshahi Division.*—The only two districts of the Rajshahi Division in which signs of distress have appeared are Rajshahi and Pabna, but relief measures may also be required later on in other districts. Looking to the generally prosperous condition of the people of these districts, the Lieutenant-Governor thinks that it is possible that no relief works other than those paid for by District Boards may be required. He does not, therefore, propose to make any provision for such works in the present estimates. A sum of one lakh may be provided for advances for village works in the whole division, viz., Rs. 20,000 for this and Rs. 80,000 for next year.

13. *Burdwan Division.—Burdwan.*—It is reported that no money is required for the districts of Birbhum and Hooghly (including Howrah). In the remaining districts no distress has yet declared itself, but in consequence of the high prices prevailing everywhere in the country, and local failure of crops, it is apprehended that relief measures necessitating the provision of funds will be required for the labouring and the poorer agricultural classes. In Burdwan certain tracts in thanas Ausgram, Budbud, Sahebganj, Monteswar, Ketugram, and Purbasthali, comprising an area of 454 square miles, with a population of about 228,000, is likely to be affected. No provision of funds under the head of relief works and gratuitous relief is considered necessary by the local officers for the current financial year, but their estimate for 1897–98 amounts to Rs. 2,00,000, including Rs. 25,000 to be provided by the District Board. The Lieutenant-Governor does not think that such a large allotment is called for, and has reduced the amount to be provided by Government to Rs. 1,00,000. His Honour also thinks that the estimate of the local officers under the head of "Advances for village works" may also be safely reduced from Rs. 75,000 to Rs. 50,000 for each year.

Bankura.—In Bankura some distress is apprehended in parts of thanas Sonamukhi, Gangajalghati, and Raipur, and in the independent outpost Simlapal. The total population at present considered likely to be affected is about 180,000 over an area of about 474 square miles. The Collector thinks that 5 per cent. of this population will require relief from the middle of February, and his total estimate for the current year amounts to Rs. 25,000, out of which Rs. 13,000 will be available from the funds of the District Board. As regards next year, the Collector has taken 12 per cent. of the population as the proportion likely to require relief from 1st April to 15th June, when the monsoon is expected to set in, and 4 per cent. from that time to the end of September. On this basis the cost under the head of relief works and gratuitous relief for 1897–98 has been estimated at Rs. 1,48,000, out of which Rs. 25,000 are to be furnished by the District Board. The Lieutenant-Governor considers 12 per cent. much too high, and on the whole is of opinion that Rs. 10,000 during this year and Rs. 50,000 in 1897–98, in addition to the contributions of the District Board, ought to be sufficient under this head.

Midnapore.—In Midnapore relief is considered likely to be needed only for 2,000 people in thana Binpur, from 15th February to 15th June, and the estimated requirements, as shown in the accompanying statement, being moderate, are accepted by Sir Alexander Mackenzie.

14. *Chittagong and Dacca Divisions.*—The Lieutenant-Governor does not apprehend any acute distress requiring relief measures on a considerable scale in any parts of the Chittagong and Dacca Divisions, and no funds are required beyond what can be provided by the District Boards.

15. The following table shows in thousands of rupees the amounts now estimated, and those previously reported to the Accountant-General, Bengal, to be required from the general revenues :—

Items.	1896-97.		1897-98.		Total.	
	As reported to the Accountant-General, Bengal.	As now approved by the Lieutenant-Governor.	As reported to the Accountant-General, Bengal.	As now approved by the Lieutenant-Governor.	As reported to the Accountant-General, Bengal.	As now approved by the Lieutenant-Governor.
1.	2.	3.	4.	5.	6.	7.
	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.
(1.) Relief works and gratuitous relief	22,38	22,12	81,69	71,76	1,04,07	93,88
(2.) Advances for village works -	4,30	5,45	7,44	11,78	11,74	17,23
(3.) Advances for grain and cattle -	—	—	—	—	10,00	—
(4.) Bounties for wells - -	1,00	1,00	10,00	3	1,00	1,03
Total - - -	27,68	28,57	99,13	83,57	1,26,81	1,12,14
Add salaries and establishment -	2,60	2,85	8,87	8,35	11,47	11,20
Grand total - -	30,28	31,42	1,08,00	91,92	1,38,28	1,23,34

The estimated contributions from the District Funds amount to Rs. 450,000 for 1896-97 and Rs. 827,000 for 1897-98.

The above are the minimum amounts which are likely to be required. They are, it will be observed, far less than the local officers have estimated. Sir Alexander Mackenzie hopes that they may be found to be sufficient. No effort has been spared or will be spared by this Government to keep expenditure down to the lowest point that is consistent with the saving of life, but it is necessary to warn the Government of India that the estimate now submitted may have to be largely exceeded.

I have, &c.

M. FINUCANE,

Secretary to the Government of Bengal.

Agriculture, No. 455 Agri. (Fam.), Calcutta, the 16th February 1897.

From M. FINUCANE, Esq., Secretary to the Government of Bengal, to the SECRETARY TO THE GOVERNMENT OF INDIA, Revenue and Agricultural Department.

Sir,

In continuation of this office letter No. 118 Fam., dated the 15th January 1897, I am directed to submit herewith the monthly report required by section 29 of the Bengal Famine Code for the period ending 30th January 1887. The districts most severely affected continue to be the four northern districts of the Patna Division; but since the last monthly report was submitted, reports under Part II. of the Famine Code have been received from other districts in which distress requiring relief measures exists, and the particulars required for a general report under section 29 (8) of the Bengal Famine Code have been incorporated in my letter No. 447 Agri. (Fam.) of this date, in which the conditions and prospects of other divisions are reported in detail. I am, therefore, in this letter to deal only with the Patna Division, submitting, with respect to it, the information required by section 29 (6) of the Bengal Famine Code, together with a copy of the reports of the Commissioner of the Patna Division, No. 55 F.G., dated 20th January, and No. 283 F.G., dated the 6th February, with enclosures.

2. *Rainfall and Prospects of the Crops.*—The month of January was marked by unsettled weather, and the rainfall continued to be of the character described in paragraph 2 of my letter of the 15th January. The following table shows the total of rainfall for each district of the division in the three months, November and December

1896, and January 1897, compared with the rainfall of the corresponding period of 1873–74, and with the normal :—

——	November.	December.	January.
	1873–74.	1896–97.	Normal.
Patna - - -	0·52	0·87	0·92
Gaya - - -	0·92	1·24	1·10
Shahabad - - -	0·54	1·38	1·24
Saran - - -	0·26	0·65	1·08
Champaran - - -	0·27	0·85	0·90
Muzaffarpur - -	0·40	0·48	0·86
Darbhanga - -	0·44	0·75	0·81

NOTE.—The figures shown are the mean totals of the district; the normals are as calculated by the Meteorological Department.

The rainfall in every district was greater than during the corresponding period of 1873–74, and except in Saran and Muzaffarpur, approximated closely to the normal. Mr. Bourdillon is therefore able to report that "crop prospects are good everywhere"; the prospects of *rahar* (*cajanus indicus*), sugar, cane, mustard, and poppy being especially favourable.

3. *Estimates of Area and Population affected.*—In the Patna, Muzaffarpur, and Darbhanga Districts no change has been made in the estimates of affected area and population since my report of the 16th December.

Shahabad District.—During the period now under report, distress has become acute in the area of the Bhabhua sub-division of Shahabad (400 square miles with a population of 115,000), which was described in paragraph 3 of my letter of 15th January, though at the time that letter was written it was not considered that there was an urgent demand for work in this tract. Mr. Marindin, the Collector, now reports that an additional tract of 60 square miles, with a population of 27,000, being the Chenari outpost in the south-west corner of the Sasaram sub-division, requires relief at once; and that he also anticipates distress in a portion of the sparsely populated Rhotas plateau, the area of which he estimates at 220 square miles and the population at 2,000 only.

Saran District.—In my letter of the 15th January, the area immediately affected in Saran was provisionally estimated at 880 square miles, with a population of 779,705. There are peculiar difficulties in forming an approximate estimate of the areas affected in this district, because the purely rice-producing tracts are in it much scattered, and do not form, as in the other districts of North Bihar, large homogeneous areas. The detailed scarcity map which was being prepared by the Settlement Department has now been completed; and the result has been to raise the estimate of area affected to 1,426 square miles with a population of 1,341,000; but in this area the amount of distress varies from village to village, even more than is usual. Mr. Earle, the Collector, does not anticipate that distress will spread greatly beyond the area now affected, and his present estimate may therefore be taken as a final one, unless unforeseen developments should occur.

Champaran District.—In my letter of 15th January, the area then immediately affected was estimated at 1,242 square miles with a population of 729,120. The area affected has again increased, as in the previous month, and is now estimated at 1,620 square miles with a population of 972,000.

A revised famine map of the Patna Division is annexed to this letter.

4. *Relief Works.*—The numbers on relief works have continued to rise in all four districts of North Bihar, the increase having been greatest in Darbhanga and Muzaffarpur. Darbhanga had, at the close of the period now under report, the largest number of labourers on relief works. Both in that district and in Champaran the great rush of labourers, which was noticed in paragraph 4 of my letter of 15th January, has been brought under control, and discipline has been restored. The transfer of large works to the charge of the Public Works Department was commenced towards the close of the period under report, and is now actively proceeding. During the month instructions were issued for the guidance of officers engaged in the management of relief works under the Public Works Department which are in details

based upon the instructions issued by the Government of the North-Western Provinces and Oudh, but differ from them, amongst other matters, in the following important particulars. In the North-Western Provinces and Oudh it was found necessary to exact a task from able-bodied men-diggers only, the numbers of this class being in the proportion of one to three to the numbers of women, children, and weakly persons who are employed as fillers and carriers; but in Bengal these conditions do not prevail and a task will be exacted not alone from diggers but from the gang as a whole, the task being calculated with due regard to lead and lift. The responsibility of the Collector for the administration of famine relief in his district generally, and the subordination to him, except in matters of purely professional detail, of all officers of every department engaged in administration of it has been maintained as laid down in the Famine Code. I am directed to append a copy of the instructions referred to, which were circulated with the resolution of this Government in the Public Works Department, No. 420 M.P.I., dated the 25th January 1897. They will be followed in carrying out smaller works under the direct control of civil officers also, so far as possible.

The following statement shows the average wages paid to the male unit in each district at the close of the period :—

—	On Task-work.	Irrespective of Task.
	A. P.	A. P.
Saran	1 2	1 2
Champaran	1 3	1 8
Muzaffarpur	1 4	1 9
Darbhanga	1 5	1 4
Patna	2 4	2 3
Shahabad	1 7	1 7

In Patna the wage given was too high, and the Commissioner's attention has been directed to effecting a reduction of it.

The following statement shows the reported cost per 1,000 cubic feet of earthwork :—

Week ending—	5th December.	12th December.	19th December.	26th December.	2nd January.	9th January.	16th January.	23rd January.	30th January.
1.	2.	3.	4.	5.	6.	7.	8.	9.	10.
	Rs. A. P.	Rs. A. P.	Rs. A. P.	Rs. A. P.	Rs. A. P.	Rs. A. P.	Rs. A. P.	Rs. A. P.	Rs. A. P.
Saran	2 5 10	2 2 0	2 15 2	3 14 10	3 1 7	2 5 6	2 12 4	2 15 5	2 12 4
Champaran	1 10 6	2 0 11	3 5 8	5 15 3	5 6 3	7 12 4	6 5 7	5 14 8½	4 14 4
Muzaffarpur	1 5 7	1 5 1	1 4 6	1 1 5	1 2 1	1 0 2	1 3 4	1 0 10	1 1 6
Darbhanga	2 4 7	2 2 6	2 2 0	2 7 10	4 3 6	3 6 3	3 0 11	2 9 2	2 14 7
Patna	1 14 3	2 1 6	1 15 4	1 15 9	1 15 9	2 1 0	2 1 7	2 1 0	1 13 9
Shahabad	1 10 8	1 9 1	1 9 11	1 13 0	1 12 7	1 15 10	2 7 8	2 15 1	3 7 2

It will be seen that at the end of the period under report the cost rate was moderate in all the districts except Champaran where, however, the Collector reports that the relief works are many of them tanks with long leads, averaging 150 feet. There was a great improvement in Champaran during the last week of the period under report. In Muzaffarpur the rate per 1,000 cubic feet was extremely low and appears to show that the task exacted is excessive. The Collector's attention has been called to the matter.

The number of relief works open at the close of the period under report was 191, and on the 9th February 194.

5. *Private Relief Works.*—The private works which were mentioned in paragraph 5 of my letter of 15th January, and in paragraph 7 of my letter of 16th December, as being carried on by indigo-planters and zamindars in the Champaran District, have now been mostly closed, and the Government organisation has taken their place; but a few works still remain open. In Saran six works continue to be provided by the Hatwa Raj; and the Maharaja of Darbhanga has relief works open in Muzaffarpur, and on a large scale in the Darbhanga District. The information regarding the private relief works is still incomplete; but, so far as reports received show, it would appear that about 13,000 people were employed on the Maharaja's works in Darbhanga on Saturday, 30th January. There are also smaller private relief works open in a few places.

6. *Poor-houses and Village Relief.*—There were eight poor-houses open under Government at the end of January, and more have since been opened. Private poor-houses and kitchens are reported to have been opened by zamindars and indigo-planters, and relief committees were formed at various places in all the districts except Patna. It has not yet been found necessary to provide artizans with relief in their own house; but stocks of cotton have in Champaran and Darbhanga been laid in, so as to provide work for women.

7. *Charitable Relief.*—At the close of the period under report the number of adult units in receipt of gratuitous relief was 4,798 in Saran, 4,255 in Champaran, 2,418 in Muzaffarpur, and 41,942 in Darbhanga: in the first named and last named districts the numbers gratuitously relieved were 57·84 and 58·74 per cent. respectively of the numbers relieved on works. As regards Saran, Sir Alexander Mackenzie has already, in paragraph 4 of my letter of the 15th January, expressed his concurrence with the view of the Commissioner and Collector, that the organisation of poor-houses and charitable relief was, in the peculiar circumstances of that district, more important than the provision of relief works. In Darbhanga the dependants of labourers on relief works are fed chiefly in their own homes and not at the works; and the Collector and his officers were so fully occupied in controlling the rush to the relief works that they had no time to give close attention to the classification and scrutiny of recipients of gratuitous relief. The village organisation for distribution of gratuitous relief is also reported to have been completed earlier in this district than elsewhere.

8. *Physical Condition of the People.*—The public health continues to be unusually good, and there is very little fever considering the season of the year. The only sign of deterioration to be found is in the slightly inferior physique of the persons admitted to some of the gaols. From Darbhanga it is reported that two beggars died of starvation, and in Saran five deaths among waifs and strays are reported to be due to want of nourishment combined with cold and illness, but, as the Collector remarks, such cases occur in ordinary years.

9. *Loans.*—The liberal offers of Government with regard to loans for village works have not met with a very ready response, although district officers have made them widely known. Only in Saran have many applications for the loans been received. Rs. 88,000 odd have been advanced under the Agriculturists' Loans Act.

10. *Food-stocks and Importation of Grain.*—During the five weeks under report the imports of food-grains into the Patna Division amounted to 7,71,186 maunds, and the exports to 3,75,650 maunds, leaving a balance of 3,96,536 maunds in favour of the division. There were large imports of Burma rice, which has, it is reported, found its way to almost every large mart in the division, but the statements submitted do not distinguish it from other kinds of rice. Prices have not risen recently, but show rather a tendency to fall; and the Commissioner now hopes that private trade will not allow stocks to run out.

11. Statements A. and B. are appended, giving the information required for the districts of the Patna Division; similar statements regarding the distressed districts of the Presidency Division will be submitted to the Government of India with a separate letter as soon as they are received.

I have, &c.

M. FINUCANE,

Secretary to the Government of Bengal.

FORM 10.

Agriculture (Famine)—No. 381, Calcutta, the 11th February 1897.

From M. FINUCANE, Esq., Secretary to the Government of Bengal, to the SECRETARY TO THE GOVERNMENT OF INDIA, Revenue and Agricultural Department.

Sir,

I am directed by his Honour the Lieutenant-Governor to submit herewith, for the consideration and orders of the Government of India, three letters* from Mr. A. Forbes, C.S.I., Officiating Commissioner of Chota Nagpur, regarding the anticipated failure of food supplies in the district of Palamau. That district is remote from any line of railway (Gaya, the nearest railway station, being 101 miles distant by road from Daltonganj), and such trade as it has is in the hands of small local dealers, chiefly Bunjaras, who have neither the capital nor the intelligence to import rice in larger quantities or from places other than those to which they are accustomed. The importation of grain from the Tributary States which adjoin Palamau has been prohibited by the Chiefs; and imports from the Lohardaga district have, according to the Commissioner, entirely stopped. These are, the Commissioner reports, the only sources from which the district of Palamau draws its food supplies in ordinary years. For these reasons the local officers fear a sudden failure of supplies, and the Commissioner is strongly of opinion that Government should intervene promptly to prevent such a calamity.

2. Mr. Forbes at first recommended that the intervention of Government should take the form of direct importation, or at least of a contract for the importation of sufficient grain to secure the adequacy of supplies on relief works, Government guaranteeing the importer against loss. He now, however, proposes as the outcome of a visit to Gaya, where he conferred with the Collector, Mr. Savage, and some of the principal grain dealers of that city, that Government should stimulate imports by paying to these latter a sum of 8 annas for every maund of Burma rice which they bring to Daltonganj. The Gaya merchants have promised, if this subsidy is allowed, to forthwith establish agencies at Daltonganj and to import Burma rice there. It is understood that 8 annas per maund represents the actual cost of carriage from Gaya to Daltonganj.

The proposal is described in detail in paragraphs 7, 8, and 9 of Mr. Forbes' letter of the 8th February, and in the note attached to that letter, and Sir Alexander Mackenzie, after discussing the whole situation personally with Mr. Forbes, considers that, if it is adopted, the difficulty of securing a food supply in Palamau, both for workers on relief works and for the population generally, will, so far as possible at present have been met. I am therefore directed by the Lieutenant-Governor to request that the Government of India may be moved to sanction Mr. Forbes' proposal to stimulate traders to import Burma rice from Gaya or Barun (the only places from which it can come) by granting a subsidy of 8 annas a maund for all imported rice passing through Maharajganj before the end of March. It is proposed that the subsidy should be given only to the end of March, by which time it will be possible to gauge the effects of the scheme, and it is estimated that the quantity which can be imported by that time will not exceed half a lakh of maunds.

3. I am to ask the favour of a very early reply to this reference, and to say that a general report on the state and prospects of the district of Palamau will be submitted to the Government of India, together with the monthly report under the Famine Code for the period ending 30th January.

I have, &c.
M. FINUCANE,
Secretary to the Government of Bengal.

No. 389 $\frac{\text{T.}}{\text{M.R.}}$, dated Camp Daltonganj, the 21st January 1897.

From A. Forbes, Esq., C.S.I., Officiating Commissioner of the Chota Nagpur Division, to the Secretary to the Government of Bengal, Revenue Department.

In continuation of my letters* I much regret to say that I now consider it my duty to submit the following report, under section 9 of the Famine Code, in regard to the

* No. 389 T.—M.R., dated the 21st January 1897. No. 412 T.—M.R., dated the 27th January 1897. No. *nil*, dated the 8th February 1897.

† 1. This Office No. 827 M.R., dated the 11th January 1897. 2. This office No. 828 M.R., dated the 11th January 1897.

district of Palamau. I had been hoping for the last few weeks that it would not be necessary for me to do so, but the sudden falling off in the imports of rice from the Lohardaga district, which has occurred within the past week, now threatens to bring matters to a serious crisis. On this subject I beg to refer particularly to the accompanying copy of my tour diary* for the last few days, which I have employed in visiting the mart of Lohardaga and in making inquiries in villages near my line of march from Chundwa (in the Tori pargana) to Daltonganj in regard to the stocks in the hands of the cultivators. It will be seen, as regards stocks, that while in some villages the supplies are quite sufficient for both food and seed, in others they fall very short of actual requirements. But even in these cases, having regard to the considerable profits from the large lac trade of the district and to the use of forest fruits and roots for food, to which many of the people are accustomed, there would not have been any real cause to apprehend danger had the supply of rice from the Lohardaga district not suddenly failed. It is not the high prices that I fear (for these can always be met by rateable wages on relief works), but the isolated position of the Palamau district and the unmistakeable signs of the approaching cessation of imports from all sides.

2. This is especially apparent in the marked shrinkage in the quantities offered for sale at the different *hâts* which have come under my observation as noted below.† The supplies at four out of these five *hâts* came chiefly from Lohardaga, and it is to be noted that in the case of the *hâts* held last week, they were obtained before the sudden falling off of exports (which began about the 15th instant, viz., the date of the *hât* held at Lohardaga on the day before my visit). I should mention also that the prices at these different *hâts* show a marked advance during the week (viz., from between 8 and 9 to about 7½ seers per rupee), as under the circumstances was to be expected.

3. Since my arrival here, on the evening of the 18th instant, I have held consultations with the Deputy Commissioner, the leading zamindars of the district,‡ and the local dealers. The opinion of all is that immediate assistance by Government is necessary in the matter of importing rice from Calcutta or elsewhere, as the neighbouring districts can no longer be drawn upon; and there are no large traders in Palamau who can possibly undertake the business of importing from further afield. It is considered by the best judges of the position here that one lakh of maunds should be sent by rail and canal to Baroon with as little delay as possible, and be forwarded from there by bullock carts to Maharajganj (34 miles) on the border of the Gaya district, whence it can be distributed by the district *biparies* to the different principal marts. Maharajganj is 42 miles from Daltonganj, and this would be a reasonable division of labour between the pack-bullocks§ of this district and carts from the other side. It would take about 2,000 carts to transport the above-mentioned quantity from Baroon to Maharajganj in one month (allowing 10 maunds per cart and five trips backwards and forwards in the month). It would take about 10,000 to 12,000 bullocks one month to carry the lakh of grain on from Maharajganj as far as Daltonganj (allowing 2 to 2½ maunds per bullock-load and four trips backwards and forwards in the month).

4. What I would suggest is that Government should at once contract with a Calcutta firm for the supply of a lakh of maunds of rice to be forwarded to Baroon, and depute a special officer to engage carts in the Shahabad and Gaya districts and to superintend its carriage to Maharajganj. Arrangements can at the same time be made by the local authorities here for its immediate transport onwards. Judging from the steadily rising prices in this district, the rice will, I have very little doubt, be readily taken up at Maharajganj by the district trade at a price which will cover the costs to Government. I may also mention that the zamindars whom I have consulted (*see* paragraph 3 above) are all anxious to take advances to considerable amounts under the conditions laid

---

§ The supposed number is between 10,000 and 15,000. The Deputy Commissioner is collecting the figures.

down in the Government orders,* and they assure me that they will willingly take the loans granted to them in grain thus imported at the cost incurred by Government, instead of in cash, if so desired. Hitherto it has not been necessary to open relief works or to arrange for charitable relief, but both measures, especially the latter, will, owing to the sudden stoppage of supplies, very shortly have to be undertaken.† For both of these grain will be required. I have no doubt whatever but that in these different ways, viz., by sale to the trade, on relief works, and in charitable relief, and, if necessary, in loans under the Land Improvement Loans Act, the quantity mentioned above will be used up in the district without any loss to Government; and I think it not improbable that it will be expended within two months or less from the time of its receipt. One measure of this is afforded by the exports from the Chainpur and Lohardaga thanas (both in the Lohardaga district) during the month of December last, which (*see* entry in my diary dated the 16th instant) have been estimated at 15,700+1,500=17,200 bullock-loads, or about 43,000 maunds, the bulk of which was sent to this district.

5. If, however, Government think it advisable to act with greater caution in this matter, then I would at least ask that arrangements be made to at once supply half a lakh of maunds in the manner indicated, preparations being at the same time made for this to be followed by a further immediate supply on receiving information of the reception met with by the first consignment. I must, however, in this connexion, state that the Deputy Commissioner and the zamindars with whom I have conferred agree in declaring that the transport of grain during the hot-weather months from Baroon into this district will be a matter of great difficulty and expense, if possible at all, owing to the scarcity of water and fodder at that time of year along nearly the whole route. If, then, on receipt of the first consignment, its rapid consumption gives proof of the district needs being greater than at present suspected (which will certainly be the case if the outturn of the *rabí* is disappointing or the *mahua* crop fails), it may then be too late to make good the threatened deficit. On the whole, therefore, I prefer to recommend the early despatch of a full lakh of maunds as suggested in the preceding paragraph; and I think that there is the greater need for this, and for its concentration at Maharajganj *as speedily as possible*, in view of the contingency of a failure in the *mahua* crop. And in any case the amount of importations during December go to show that the district will probably require at least half a lakh of maunds a month (or even more) during the four months, May to August, after the consumption of the *rabí*. It will be the safest plan, therefore, to concentrate the first lakh of maunds as speedily as possible at Maharajganj, in order to give time for the concentration of another two or three lakhs, if the rate of depletion of the first supply indicates the necessity of this, by the middle of April. And I would in this view of the case recommend that arrangements should be made for the employment of 4,000 bullock carts in the Shahabad and Gaya districts, in order to transport the first consignment of one lakh to Maharajganj, if possible, within a fortnight of its arrival at Baroon.

6. The particulars required to be submitted by paragraph 9 of the Famine Code with this report are contained in the accompanying copy of Mr. Renny's letter No. 1681 R,, dated the 18th instant, with my marginal notes. Regarding the Statements B. and C. attached to Mr. Renny's report, containing proposals for the division of the district into relief charges, I will address Government in another letter, after discussing this question more fully with that officer.

7. In conclusion, I beg that Government will press upon the Telegraph Department the urgent necessity of at once completing the telegraph line from Aurangabad to Daltonganj, the want of which is very severely felt in an emergency such as the present one.

No. 412 T.—M.R., dated Camp Daltonganji, the 27th January 1897.

From A. FORBES, ESQ., C.S.I., Officiating Commissioner of the Chota Nagpur Division, to the SECRETARY TO THE GOVERNMENT OF BENGAL, Revenue Department.

Since writing my No. 389 T.—M.R., dated 21st instant, I have been making further inquiries regarding stocks of food-grains and the requirements of this district (Palamau). On the 25th instant I received your demi-official, dated 22nd idem, with its enclosures,

---

* Government Order No. 76 Agri., dated the 31st December 1896.

† This is now being done.

and also your telegram, dated 23rd instant, informing me that it is impossible for Government to arrange to send rice to Maharajganj, as recommended in my letter of the 21st. The orders referred to in that telegram, as having been issued on the 22nd, concerning advances for purchase and importation of grain, have not yet reached me.

2. *State of Stocks in Villages.*—I have had further inquiries into village stocks made during the past few days by Mr. D. Sunder (Settlement Officer) and Mr. Fullerton (District Superintendent of Police) in a number of villages to the north and north-west of Daltonganj, within a radius of 15 or 16 miles of that place. Appended is a list* showing the results of those inquiries in 23 villages. They are not dissimilar to those which I obtained on my way here, in pargana Tori and elsewhere, viz., they go to show that there are still stocks in the country quite sufficient, in some places, taken with the use of jungle products, to last at least until the *rabi* and the *mahua* come in, *if they (the stocks) were evenly distributed;* but that they are very *unevenly* distributed amongst different villages and individuals, and that we must therefore expect a very considerable number of labourers on the relief works which are now being opened. I may mention that the bulk of the people in the part of the country where the above inquiries were made belong to the labouring classes—Ahirs, Dusadhs, Chamars, Kharwars, Bhuias, Kahars, Gareris, and others of the Kamia class—who are usually helped through, during slack times between harvests, by their zamindars and other employers. But at present, owing to the excessively high prices of grain and especially to the shrunken state of the markets, help of this kind is *very sparingly given, and must not be relied upon.*

3. *Supplies and Prices at Hâts.*—On the 21st instant I visited, with the Deputy Commissioner, the large weekly *hât* at Garwa, 20 miles north-west of this place. We found about 60 maunds of rice and 80 maunds of *makai* for sale, at $8\frac{1}{2}$ and $10\frac{1}{4}$ seers per rupee, respectively, as compared with 9 and $10\frac{1}{2}$ seers, the prices ruling at the previous week's market. About 150 pack-bullocks had come from Singrauli (in Mirzapur) for grain. Of these 48 obtained supplies, and the rest departed empty. We found that some of the rice exposed for sale had come from Nasriganj and Daudnagar, from tracts in Shahabad and Gaya irrigated by the Sone Canal, and the *makai* from Ranka and Katri in this district. There were also some 20 maunds of *marwa* for sale from villages in the neighbourhood. All food-stuffs in the *hât* were readily disposed of, the demand apparently being considerably in excess of the supply.

On the 23rd we visited another of the principal weekly *hâts* of the district, viz., that held at Chainpur, 2 miles from this place. There were 99 maunds of rice for sale, as compared with 100, 83, and 80 maunds reported to us as having been brought for sale in the three preceding weeks, but prices had gone up from 9 and $9\frac{1}{2}$ seers to 8 and $8\frac{1}{2}$ seers per rupee, and every ounce was eagerly snapped up at these high prices. We arrived as the last quantities were being sold; they were of very indifferent quality, and had come from the Lohardaga district. Of *makai* there were about 20 maunds for sale at 11 seers per rupee as compared with 13 seers per rupee on the preceding market day. The *hât* was attended by large crowds, all eagerly interested in the question of the food-supply.

4. The weekly price list from a number of different *hâts*, with which I am now supplied by the Deputy Commissioner, exhibits for the two past weeks the following results:—

—	Week ending 16th instant.	Week ending 24th instant.
Number of *hâts* at which rice was selling at less than—		
8 seers per rupee	4	7
8 „ and under 9 seers per rupee	13	26
9 „ „ 10 „	58	40
10 „ „ 11 „	10	6
11 „ or over	1	0
Total *hâts* from which price lists were received	86	79

The rapid and general rise in prices is only too apparent.

5. *Imports from Lohardaga.*—The export trade from the central mart of Lohardaga is reported to me daily by the Police Inspector of that place. The operations during the

* Not reprinted.

week following the date of my visit there (on the 16th) are shown in the following statement :—

Date.	17th.	18th.	19th.	20th.	21st.	22nd.	23rd.	Remarks.
1.	2.	3.	4.	5.	6.	7.	8.	9.
Number of pack-bullocks remaining from previous day.	189	123	87	72	Nil	34	275	These bullocks came from different places in the Palamau district, and also from Chatra, Hazaribagh, and Sherghatty.
Number of pack-bullocks which came for supplies.		235	88	Nil	67	587	166	
Number of bullocks which left with supplies.	41	37	49	44	16	97	88	The selling price of rice at Lohardaga is reported at 16 kutcha seers from 17th to 20th, 17½ seers on 21st and 22nd, and 17 seers on 23rd.
Number of bullocks which left without supplies.	25	234	54	28	17	249	265	
Number remaining in hope of getting supplies.	123	87	72	Nil	34	275	88	

The Inspector's returns do not show the quantity of stocks available for sale on each day, but from the fall in rates after the 20th it seems probable that there were some unsold stocks in hand and that the price declined on the 21st owing to the continued refusal of the exporting *biparis* to pay so high a rate as 16 kutcha seers (=9 seers pucca) per rupee. Be this, however, as it may, the great and sudden constriction in the export trade from Lohardaga is unquestionable ;* and the large number of empty pack-bullocks which are daily leaving that mart shows that that constriction continues.

6. *Supplies of Grain for Relief Works.*—For the present, as I mentioned in my No. 401 T.—M.R., dated 24th instant, rice is being supplied for the relief works which are now being opened by certain of the leading zamindars, and I have advised the Deputy Commissioner to make payment to the labourers one-half in rice and one-half in cash. We are driven to this expedient in view of the great scarcity of the rice in the public market, for even if we succeeded in purchasing supplies there or (which would in effect amount to the same) in contracting for them with a local dealer, we should only succeed in completely draining the *hâts* for miles round, which would greatly intensify the prevailing scarcity, and probably drive the whole of the population on to the relief works. As it is, however, we are forced to give part payment in cash in order to spin out our small stock of rice, the only alternative being the prospective sudden closure of the relief works, owing to our inability to comply with the requirements of sections 79 and 80 of the Famine Code and the orders in paragraph 4 of Government Order No. 76 Agr., dated 31st ultimo. The Deputy Commissioner has received so far, promises of 3,000 maunds of rice from the zamindars noted below.† This, expended in the above manner, will last for about 8,000 persons for 30 days, or for 12,000 persons for 20 days, and the Deputy Commissioner's aim must be to keep down the numbers to these figures for the present, until he can see his way to securing a constant supply from outside of the district, preferably, of course, of Burma rice from Calcutta.

7. *The Steps to be taken to keep up the Food Supply of the District generally.*—I find, on further inquiry, that the difficulties of importing supplies from Barun during the hot weather are not so insuperable as I was at first led to suppose, and I gather from a re-perusal of the reports of the then Sub-divisional Officer that in 1874 the *biparis* bullocks were working throughout the hot-weather months. I also now learn from the District Engineer (who was not here when I wrote my letter of the 21st) that between this place and Maharajganj there are several river-beds in which a sufficient supply of water may be obtained if sufficiently large and deep reservoirs are prepared in them; and I have instructed the Deputy Commissioner to have this work at once taken in hand and pushed on vigorously. The *rabi* crops will also give supplies of fodder for at least six weeks, and the Deputy Commissioner is also taking steps, with the aid of the zamindars, to collect further supplies at halting places on the route, for sale to such *beparis* as may be unable to supply themselves. On the whole, I see reason to think that if Burma rice can be obtained in sufficient quantities and at a reasonable

* From paragraph 4 of my letter of the 21st it will be seen that the number of bullock loads of rice exported in December was reported to be 15,700.

† Rai Thakurai Bhagbat Dyal Singh Bahadur of Chainpur; Bhyia Dirguj Deo, of Untari; Babu Krishna Bux Rai of Nawa; Rai Thakurai Govind Prasad Singh Bahadur of Runka; Babu Bhagbat Bux Rai of Bisrampur; Babu Ram Charn Singh of Bhamandih; Kuwar Lal Jiwan Singh of Ladi; Thakur Jugdishwar Deo Singh.

cost *at Barun*, the local traders will be able to bring it on, in sufficient quantities, to feed the district. They did so in 1874, when a considerable portion of the consignments had to come much longer distances, and they should be able to do so now. The Daltonganj traders whom I have questioned on this point agree that this will be feasible.

8. The questions for solution are—(1) how is sea-borne rice to be got to Barun? and (2) at what price should it be laid down there? As to (1), I have had several long interviews with the local traders, and must pronounce it impossible to hope for any material help from them. They are all petty local dealers whose ideas of trade in food-stuffs have never gone beyond the distances their bullocks can travel. Only one of them has an agent in Calcutta, and this is in connexion with a small business in cotton goods. They know nothing about the Calcutta market, and, as I have before brought to your notice, they in common with all of us here, are heavily handicapped by being 59 miles from the telegraph office and 101 miles from the nearest post office on the railway (viz., Gaya). Any idea of such men, in face of such difficulties, being able to meet the present emergency must be at once laid aside. They are perfectly helpless in the matter, and the evidence afforded by the numerous droves of their empty pack-bullocks wandering about the country, from one *hât* to another, in all directions, on a fruitless search for grain, is sufficient to show this at once, and to give proof, if any were needed, of their very limited capabilities. It is clear that the requisite supply of grain *must* be kept up at Barun by some outside powerful agency, if we are to avoid the risk of a serious disaster; and we require the first consignment without a day's loss of time.

9. As to the price at which the Burma rice should be obtainable at Barun, in order to bring it at all within the means of the people, I beg to make the following observations. The dealers here tell me that it costs from 5 to 6 or 7 annas per maund to transport rice from Barun to this place. The dealers at Gurwa laid the cost at 6 annas per maund. This, taking 6 annas, seems not unreasonable. One bullock cart, carrying 15 or 20 maunds, will, I am told, take six days each way from here to Barun. The charge thus comes to from Rs. 5 to Rs. 7–8 per cart for 12 days. What the dealers say is that one seer per rupee covers their expenses between Barun and this place, and gives them ordinary profits. Thus, if they can get rice at 10 seers per rupee at Barun, they can retail it here at 9 seers. Lately a few driblets have been brought here from the tracts along the Sone Canal in Shahabad and Gaya. The rice was purchased there at 17½ kutcha seers per rupee* (about 10 seers pucca weight, and the retail price here to-day is 15 kutcha seers (= 8 seers 7 chitaks pucca). Now Burma rice, I am informed, sells at about 1 seer per rupee cheaper than the country rice, the difference being due to its being a less substantial article of food. It follows, therefore, that unless the rate for country rice in this district is to be kept up to under 9 seers per rupee, the Burma rice must be laid down at Barun at not higher rate than 11 seers per rupee. It appears to me incumbent on Government to come to the aid of this helpless district in this matter by arranging for the requisite supplies at not more, if possible, than the selling price indicated above, to be forthcoming at Barun—thus being brought within reach of the district trade—*without the least delay.*

10. *Supplies of Grain for Relief Works.*—From what I have said in paragraph 5 above, it will be apparent that, irrespective of the question of the supply of food for the district generally, it is *absolutely necessary* for the Deputy Commissioner to be provided with a supply of some 10,000 maunds of rice at Daltonganj within, at latest, the next three weeks for the use of the labourers on the relief works. I have done my best to arrange with the local dealers here for this limited quantity of Burma rice. They have come to me at the last moment, while I write this, like a pack of children, with a statement of their terms, as noted in the Appendix II.† to this letter. They premise that they have no agents in Calcutta, and that one of themselves will have to go there and do his best to arrange the purchase and despatch of the rice; that they have never entered upon this business before, but would like to speculate now if they can assure themselves against loss and are certain of a reasonable profit; and this they certainly seem to provide for in the terms they demand. I have no idea at what rate a dependable Calcutta firm, like Messrs. Jardine, Skinner, and Company (who have

* It would have been sold at 9 seers had the market not been depleted.
† Not reprinted.

large lac dealings in this district), would undertake the contract; but, having regard to the absolute necessity of punctuality in its performance, I have no hesitation in recommending the employment of some reliable agency of the kind, and in strongly deprecating a first experiment being tried with a body of inexperienced petty dealers in a matter of such vital importance.

P.S.—Please note that a letter posted in Calcutta on Monday does not reach Daltonganj until Wednesday afternoon, while the reply, if posted here next day (viz., Thursday), will not reach Calcutta until the following Sunday. A telegram despatched from Calcutta on Monday (any time) will not reach Daltonganj until Tuesday afternoon; a telegram in reply, despatched from here before 6 p.m. the same day, reaches Aurangabad (the telegraph office) on Wednesday afternoon (and Calcutta the same day), but if not despatched from here till the following (Wednesday) morning will not reach Calcutta until Thursday.

No. , dated Calcutta, the 8th February 1897.

From A. FORBES, ESQ., C.S.I., Officiating Commissioner of the Chota Nagpur Division, to the SECRETARY TO THE GOVERNMENT OF BENGAL, Revenue Department.

In my No. 412 T.—M.R., dated 27th ultimo, I addressed you on the subject of the necessity of providing supplies of food-grains for (1) the labourers on relief works and recipients of gratuitous relief, and (2) for sale to the general public, in the district of Palamau. Since then, in conformity with the orders conveyed in your telegram of the 2nd instant, I have visited Maharajganj (in Gaya) which adjoins Harihargani (on the north-east border of Palamau) in company with the Collector of Gaya, and have interviewed the grain-dealers of both Maharajganj and Gaya.

2. The isolated position of the Palamau district will be understood by reference to the accompanying skeleton map. It is bounded on the west by the district of Mirzapur, North-Western Provinces, and the Sirguja Tributary State; on the south by Lohardaga; on the north by the Sone river, and the range of Kymore hills in Shahabad; on the east by Hazaribagh and Gaya. Its usual source of supply is from the Native States on the west, and from Lohardaga to the south. These sources, as explained in my last letter, are now practically closed. Sirguja, Udaipur, Jashpur, and Gangpur have for some time past forbidden the export of food-grains, and Lohardaga (see paragragh 4 of my previous letter) is closing its doors. Hazaribagh cannot assist. It has itself been importing hitherto from Lohardagga, and is now turning for help to Calcutta *viâ* the railway station at Giridih. Giridih is about 135 miles from the eastern confines of Palamau (at Loharsee), about 30 miles of which is a mere mountain track, traversable only by pack-bullocks. The only hope for the district at present is in supplies at its north-east corner from Shahabad and Gaya by the road passing through Maharajganj. The distance by this road from the railway station at Gaya to Daltonjganj is 101 miles; from Barun (at the end of the Sone Canal) 73 miles. The 101 miles are kutcha; so are 59 of the 73. The 42 miles from Maharajganj to Daltonganj lie through a hilly difficult country. The distance is done by bullock carts in eight days from Gaya, and in six from Barun, the return journey taking one to two days less.

3. I reproduce the following figures showing the prevailing rates at the Palamau *hâts* during the second and third weeks of January. The return for the fourth week has not yet reached me, owing to the uncertainty of my movements during the last few days and the long distances the post has to travel on foot:—

—	Week ending 16th January.	Week ending 24th January.
Number of *hâts* at which rice was sold at under 8 seers per rupee -	4	7
Number of *hâts* at which rice was sold at 8 seers and under 9 seers per rupee.	13	26
Number of *hâts* at which rice was sold at 9 seers and under 10 seers per rupee.	58	40
Number of *hâts* at which rice was sold at 10 seers and under 11 seers per rupee.	10	6
Number of *hâts* at which rice was sold at 11 seers and over - -	1	0
Total number of *hâts* from which price-lists were received - -	86	79

The *hâts* from which the returns were received are shown in red on the accompanying map. It will seem that they are fairly sprinkled over the whole district. It will be further noticed by a comparison of the map with the enclosed list of *hâts* that those where the prices ranged lowest (viz., under 8 seers) are in the tracts bordering on Lohardaga, Hazaribagh, and Gaya, in the south and east.

4. As I have before explained, it is extremely difficult, owing to the irregular formation of the country, to form any reliable estimate as regards stocks. But it is very certain that the supplies in the public *hâts* are quickly running short. Either the stocks are not there, or they are beginning to be very closely held. In either case the position must be relieved with as little delay as possible. If it be that the requisite stocks do not exist, the Government must be prepared for a serious calamity if further time is lost before applying a remedy. My own belief is that a certain number, probably the majority, of the mahajans and landholders have stocks just sufficient to carry their debtors and raiyats on, with the assistance of the *mohwa* and *rabí* if both are good, until the next *bhadoi* harvest. But I cannot say as a fact that this is so, and it would not be right for Government to assume it; and in any case it is unquestionable that there are many villages with practically no resources in the way of stocks at all. Take, for instance, the 23 villages visited by Mr. Sunder (*see* Appendix I. to my last letter). He found in all 4,157 kutcha maunds = 2,806 pucka maunds of different kinds of grain (including paddy) amongst 2,545 adults and 1,724 children. It is clear that the people in the tract Mr. Sunder visited will very soon even after eating up their seed have nothing to go on with. I wish to again impress upon Government the serious risk we are running if immediate steps are not taken to bring grain into the Palamau markets.

5. My first suggestion in my No. 389 T.—M.R., dated 21st ultimo, was that the district in view of its isolated position should be treated on the system adopted in 1874, viz., that Government should itself import, to begin with, one lakh of maunds of rice. In modification of this in my last letter I recommended that Government should lay down rice at Barun to be sold to the Palamau dealers at a certain minimum price. The difficulty all through has been this, viz., that the Palamau dealers, one and all, are merely petty bazar *bunniahs*, accustomed only to deal in bullock loads with the surrounding villages, almost extending their operations to the immediately adjacent districts. Indeed, even this is overstating their case; practically it is the bullock-drivers who are the real traders. They wander about picking up supplies wherever they can find them, then taking them from one *bunniah* or from one *hât* to another until they can get rid of their loads at a small profit. The dealers at Maharajganj (Harihargani), whom Mr. Savage and I interviewed three days ago, are men of equally humble views. They eke out a living by buying paddy by the bullock-load from the *beparis*, employing their own and other women to husk it, and then retailing their purchases in the form of rice. I can assure Government that it is perfectly useless to look for any material help in the present circumstances from the Palamau dealers.

6. The adjoining district of Hazaribagh presents a marked contrast to Palamau in this matter. At Hazaribagh there are several firms of wealthy Marwaris trading directly with Calcutta. As regards shortness of stocks and high prices, the two districts are very much on a par, Hazaribagh if anything being worse off in these respects than Palamau. But for Hazaribagh I am under no apprehension, for these Marwari traders are fully alive to the position, and although the railway station at Giridih is over 70 miles from the Sadar station by road, yet imports of rice from Calcutta and other places down country are going on briskly. I have figures before me showing importations by these men by rail amounting to nearly 2½ lakhs of maunds between January and October last. Figures for the subsequent three months have not yet been obtained; but when I was at Hazaribagh a week ago they informed me that they then had from 8,000 to 10,000 maunds, just arrived, at Giridih, including a consignment of between 300 and 400 maunds of Burma rice. This may be taken as an example of what would now be happening in Palamau if we had dealers there to do the work for us.

7. And I now find that we can furnish ourselves with such dealers if we offer a reasonable inducement. Several of the large Gaya dealers to whom I yesterday spoke on the subject are willing to at once establish agencies at Daltonganj for the importation of Burma rice, if Government will consent to give a certain bounty per maund on such rice laid down there. I strongly recommend this scheme for favourable consideration. The rate I would suggest is 8 annas per maund. This

will about cover the cost of cartage from Gaya, and will go towards placing the Palamau *hâts*, as regards selling prices, more on a level with the districts of Bihar which are all traversed by the railway. There will still be an advantage in the case of the latter districts, as they are all much better off as regards interior communications than is Palamau, but the great inequality which now exists will in part, at least, be removed. In a year or two after the branch railway to Daltonganj has been constructed, there will be no need of any artificial aid of this kind. Meanwhile, however, Palamau is exceptionally situated, and a remedy of an exceptional kind is necessary.

8. The scheme I have ventured to suggest has to my mind the following advantages:—

(1.) It makes the trade do what we shall otherwise have to do ourselves. The alternative is to force everyone who cannot find food in exchange for his money on to our relief works, where he knows that he can find a supply. We shall have to make correspondingly large imports, and to undertake the whole work of distribution. It is true that we may be able to do this by means of contractors. But, as will be gathered from what I have before said, Palamau is particularly unfortunate in this respect, and we may find that we shall have to import the contractors as well as the rice. We shall at any rate give ourselves and a certain proportion of the persons we relieve a great deal of quite unnecessary harassment.

(2.) There seems no reason why Government should incur the entire cost of feeding (on its relief works) a more or less large residuum, who would prefer to feed itself at a cost to Government of only one-eighth or one-tenth of such entire cost.

(3.) If, as I propose, we leave the work to the trade, it will feel the pulse of the market much better and more quickly than we can do so. Matters will speedily adjust themselves. If there is *no* real scarcity of stocks, prices will at once fall, and imports, notwithstanding the bounty of 8 annas, will forthwith cease; for immediately the price at Daltonganj falls to that at Gaya, the risk and trouble (though we practically pay the carriage) will turn the scale. If there *is* real scarcity, prices at Daltonganj will continue to rule higher than at Gaya, and imports will go on. These are the exact results we wish to get, and the trade can get them for us much better than we can do ourselves.

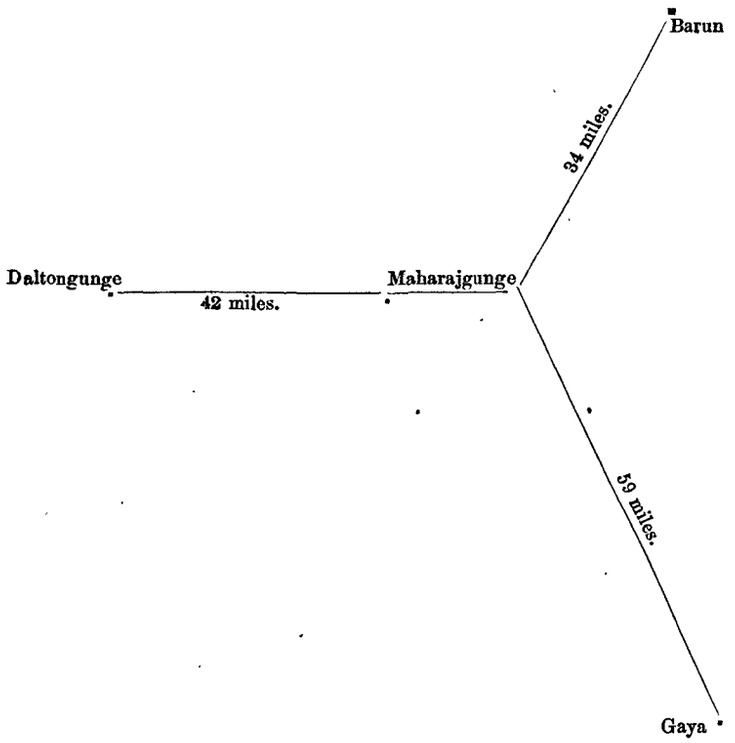
(4.) The tendency amongst traders is to buy supplies as close at hand as possible. Palamau is now draining the outlying parts of Gaya district near to its borders. Our object is to introduce a stream of sea-borne food *through* these affected tracts. The Collector of Gaya very reasonably objects strongly, in the interests of his own district, to what is going on. I entirely agree with him, and my proposal will help to put a stop to it.

9. I consider that Government will be perfectly safe, as regards being in any way "rushed," in adopting my present proposal. As pointed out in paragraph 8 (3) above, claims on account of bounty will very soon disappear, if it is not needed. It will quickly die a natural death; moreover, the means of transport are limited. If the traders are able to engage 1,500 carts they will do better than I expect. At 15 maunds per cart and two trips in a month, some 45,000 maunds per mensem will be their outside achievement. The great advantage, however, will be that the test of what we have to expect will be an unfailing one. Within a couple of weeks or so we shall, for the time at least, have gauged the situation. Afterwards, as scarcity increases or subsides, so will the operations expand (so far as means permit) or contract. In conclusion, I beg very respectfully to press upon Government the risk of further delay in gauging the situation and applying the requisite remedy. The scheme I propose will do both more quickly and cheaper, and with less disturbance to trade than any other plan that I can think of.

10. As regards a provision of supplies for relief works, I beg to submit a note (Appendix III.) of the communications I have held with the dealers at Daltonganj, Hazaribagh, and Gaya, and with Messrs. Radford and Company, the steamer agents at Dehri. I note that it was said, in conversation with yourself this morning, that I might conclude a contract with Messrs. Ganesham Dass and Chuni Lall of Gaya for the immediate supply of 10,000 maunds of Burma rice, on the terms settled with them yesterday by the Collector of Gaya and myself, for the supply of grain for payment of wages on relief works in kind, if necessary.

If the proposals now submitted are accepted it will, in my opinion, be unnecessary for Government to import at all; and I think it preferable that they should *not* do so, as their doing so will no doubt act in checking all hope of a private trade springing up between Daltonganj and the railway at Gaya, and this is what we wish to establish and stimulate.

NOTE.—My method of checking the import of Burma rice for payment of bounty at Daltongunge will be as follows:—



This sketch shows relative positions of Daltongunge, Maharajgunge, Barun, and Gaya. The Burma rice can only be imported *viâ* Barun or Gaya. By either route it passes through Maharajgunge to get to Daltongunge. At Maharajgunge an officer of the rank of Sub-Deputy Collector or kanungo will be stationed. The merchants will be notified that each consignment of Burma rice on which they intend to claim bounty must be checked by this officer. He will send the advice of each consignment, giving number of bags and weight (one rule will be that the bags must be uniform and hold two maunds each) to Deputy Commissioner of Palamau. As each consignment reaches Palamau, it will be reported by the merchants' agent to the Deputy Commissioner, who will be responsible for seeing that the consignment agrees with the advice, and, on being so satisfied, will pass the bill for payment of the bounty.

If considered necessary, the officer at Maharajgunge can mark the bags with a stamp, and stencil-plate the date, and the Deputy Commissioner at Daltongunge can erase stamp and date with a paint brush.

I apprehend no practical difficulty. The distance (42 miles of difficult road) between Maharajgunge and Daltongunge is too great to make it worth any one's while to take rice all the way back again from Daltongunge to Maharajgunge and in again to Daltongunge in order to get bounty twice on the same package.

No. 577 F., dated Calcutta, the 15th February 1897.

From T. W. HOLDERNESS, Esq., C.S., DEPUTY SECRETARY TO THE GOVERNMENT OF INDIA, DEPARTMENT OF REVENUE AND AGRICULTURE, to the SECRETARY TO THE GOVERNMENT OF BENGAL.

I am directed to acknowledge the receipt of your letter No. 381 (Famine), dated the 11th February 1897, in which the approval of the Government of India is asked, for reasons stated, to the proposed grant, by the Government of Bengal, of a subsidy to traders of 8 annas a maund for all rice imported into the Palamau District and passing through Maharajgunj between now and the end of March.

2. Inquiry has convinced his Honour the Lieutenant-Governor of Bengal that in the Palamau District there is a real danger that the local supply of food will run out owing to the inaccessibility of the district and to the inertness and inexperience of the local traders, and his Honour is satisfied that some action in assistance of the local machinery is necessary. The case therefore falls within the conditions which in paragraph 159 of the Famine Commission Report are held to justify intervention, and, as stated in paragraph 10 of the Government of India's letter No. 104 F., dated 4th January 1897, the Lieutenant-Governor has full discretion to take such measures as may in his opinion be necessary to stimulate trade. The action proposed to be taken on the facts reported by the Commissioner of the Division has the concurrence of the Government of India.

Agriculture—No. 609 (Fam.), Calcutta, the 1st March 1897.

From M. FINUCANE, Esq., Secretary to the Government of Bengal, to the SECRETARY TO THE GOVERNMENT OF INDIA, Revenue and Agricultural Department.

Sir,

In continuation of this Government's letter No. 455 Agri. (Fam.), dated the 16th February 1897, reporting on relief operations in the Patna Division, I am directed to submit famine statements A. and B. for the districts of Nadia and Khulna, together with the following report on the condition and prospects of the Presidency and other divisions in Bengal.

2. *Presidency Division.*—*24-Parganas and Murshidabad.*—Of the districts in the Presidency Division there is nothing new to report with regard to the 24-Parganas, in which there is no distress at present, nor any immediate prospect of necessity for relief. In Murshidabad, as reported in paragraph 9 of my letter No. 447 Agri. (Fam.), dated the 16th February 1897, there is some probability of distress, especially in a tract bordering on the affected area in the north-west of the district of Nadia. Test works have been opened, and the situation is being carefully watched.

Jessore.—In the district of Jessore the worst tracts are an area of 103 square miles in the north east of the Magura sub-division, situated mostly in thana Muhammadpur but partly in thana Magura and outpost Salikha, and an area of 163 square miles in thana Bangaon. The total population of the two tracts is about 163,000. The most important crop in these tracts is *amun* or winter rice, which, in consequence of deficient rainfall from July to November, was a total failure, the average outturn, except in *bils* or swamps, being estimated at about two annas. The crop next in importance is the *aus* or autumn paddy, the outturn of which last season was only about six annas; the *rabi* crops also, which are of minor importance, have suffered for want of rain. On the other hand, jute is largely grown in the tracts in question, and yielded a good outturn. Another resource of the people of these parts is the date-palm which is extensively grown and affords a means of subsistence to many till the middle of March, when the tapping season closes. In consequence of high prices, some slight distress is being felt, and a small number of persons has been placed on gratuitous relief. But distress requiring the opening of relief works is not considered likely to appear till March or April, and may last till the end of June. The Lieutenant-Governor does not apprehend that relief measures on an extensive scale will be required in this district.

Khulna.—The area now affected in the district of Khulna is 442 square miles with a total population of 262,000 persons, comprising thanas Asasuni, Magura, and Kaliganj in the Satkhira sub-division, and a portion of thana Paikgacha in the Sadar sub-division. Nearly the whole of this area consists of reclaimed Sundarban lands, and is intersected by numerous tidal rivers and channels, the water of which is salt during the greater part of the year. Practically the only crop grown is winter rice, the aggregate area occupied by other crops being, it is believed, not more than 2 per cent. of the total cultivated area. The failure of the rice in this area is not so much due to shortness of

the rain as to impregnation of the soil with salt water arising from the failure of the local landholders to keep up embankments. Their attention has been called to the matter, and it has been pointed out to them that the responsibility for relieving distress in this area rests primarily with them. In the first five months of 1896 the rainfall recorded at Satkhira and at Nakipur, another recording station in the Satkhira sub-division, fell short of the normal by 6·04 and 9·17 inches respectively, and was not sufficient to wash out the salt from the soil. The lands had, moreover, been submerged by a storm wave in October 1895, which partially destroyed the crop of that year and left a large deposit of salt. The result of this combination of unfavourable circumstances and of the short ill-distributed rainfall from July to November was that the winter rice crop almost entirely failed over the greater part of the area in question. There can be no doubt that the failure of the winter rice crop for two successive seasons has caused distress among the people, but although relief works have been opened in the affected tract since December last, the number of labourers employed on them is still small. At the end of January there were three relief works open, but the total number of labourers shown in the famine statement A. now submitted is only 147. Since then the number has increased, the total number reported on the 21st February being 351. It is remarkable that there are no women among the relief workers. This is reported to be due to the social customs of the people of the district which debar women from seeking employment on relief works. The number on gratuitous relief at the end of January was 142, and, on the 20th February, 727, of whom 374 were women.

The condition of the affected tract was reported at the end of January to have undergone no change. There is no *rabi* crop, and food stocks were reported to be small, but grain was being imported by the local dealers. Two more tracts are considered likely to be affected in this district, viz., an area of 60 square miles with a population of 46,000 in thanas Satkhira and Magura, where distress is apprehended from the middle of March, and 201 square miles with a population of 96,000 in thanas Mollahat and Morelganj of the Bagerhat sub-division, but the Commissioner has not yet put this Government in possession of complete information regarding these tracts.

Nadia.—In the district of Nadia distress is spreading, and the areas affected at the close of January were :—

Thanas.	Square Miles.
Kaliganj	109·00
½ Nakashipara	67·50
½ Chapra	65·00
½ Meherpur	66·50
½ Gangni	63·00
Karimpur	193·00
½ Daulatpur	72·00
¾ Tehatta	135·00
¼ Naopara	44·25
	815·25

The population of this area is reported to be 428,644.

The tracts where distress first made its appearance are the Kaliganj and Nakashipara thanas of the Sadar sub-division and thana Tehatta of the Meherpur sub-division. This portion of the district is known as the Kalantar, and is a low lying tract subject to floods and well adapted to the cultivation of winter rice. There is very little land in this area suited to the cultivation of *aus* or autumn paddy, or of *rahar* (*cajanus indicus*), but *rabi* crops, such as wheat, gram, linseed, &c., are largely grown. In consequence of insufficient and unseasonable rainfall, the outturn of the *aus* crop was not more than 6 annas and the winter rice was almost a total failure, the estimated outturn being only one anna. Of the *rabi* crops, generally speaking, wheat and lentils as well as *khesari* (*lathyrus sativus*) and peas have totally failed, and the other crops which have yielded some outturn do not materially affect the condition of the tract in question. The condition of thanas Karimpur and Daulatpur in the Meherpur sub-division, as described by the local officers, is similar to that of the Kalantar. The principal crops grown are rice and *rabi*. Last year the average outturn of all crops taken together

was not more than 8 annas. This year the *aus* yielded only about a four-anna outturn, while the *aman* or winter rice has been a total failure, and the prospects of the coming *rabi* are reported to be gloomy. A great part of the population of both tracts consists of landless labourers and poor cultivators. Test works were started early in December. In the report for the second half of January it is stated by the local officers that two test works and two regular relief works under civil officers, and one relief work under the Public Works Department, were open during that period, and the total numbers on relief works and gratuitous relief at the end of the month were 8,229 and 1,084 respectively. The only other form of relief given was in the grant of loans, and it is stated that Rs. 15,950 were advanced under the Land Improvement Loans Act to 25 applicants during the period under report.

3. *Chota Nagpur Division.*—Particulars regarding the Chota Nagpur Division were furnished in paragraph 8 of my letter on estimates of expenditure No. 447 Agri. (Fam.), dated the 10th January 1897. The Commissioner's report for the second half of January shows no change for the worse in the condition of the districts of Lohardaga and Singbhum.

Palamau.—As regards the district of Palamau, under the recent orders of the Government of India, a subsidy of 8 annas a maund (up to a limit of 50,000 maunds) from general revenues has been sanctioned in aid of the importation of grain up to the end of March. The causes of distress in the district of Palamau were fully described in the papers submitted to the Government of India with my letter No. 381 Fam., dated the 11th February 1897, are briefly as follows :—Palamau does not in the best of years produce sufficient food for the support of its population, but depends on certain tributary States and the district of Lohardarga to make up the normal deficit in the food supply of the district. This year, in consequence of the general failure of crops, these sources of supply have stopped. There was only a five-anna winter rice crop, preceded by a *bhadoi* or autumn crop of 9½ annas, and by poor harvests in 1895–96. The whole district, with an area of 4,905 square miles and a sparse population of about 600,000 persons, is reported to be affected. Prices are unusually high, being in places less than 8 seers per rupee. The worst portion of the district is a broad tract, of which the area has not yet been reported by the local officers, running from east to west through the centre of the district. It is within this tract that the scarcity of supplies for sale and the consequent high prices are most felt. In the block to the north of this tract, the state of things gradually improves until the Gaya border is reached, where no indication of distress is at present visible. The corresponding block to the south abounds in forest products, and does not as yet give any great cause for anxiety. During the period under report relief measures were still being organised. The telegraphic report of the 21st February shows that on that date there were in Palamau 2,602 persons on relief works and 409 on gratuitous relief.

Manbhum.—In paragraph 8 of my letter No. 447 Agri. (Fam.), dated the 16th February 1897, it was stated with regard to Manbhum that the outturn of the winter rice crop averaged about 5 annas in thanas Gobindpur, Tundi, Nirsha, Chas, and Chandil, comprising 1,280 square miles with a population of 361,000 persons, and that, with the exception of thana Chandil, this area included the greater part of the tracts affected in 1873–74. It was also stated that the Deputy Commissioner was of opinion that if the *mahua* crop failed, two-thirds of the district, with a population of 800,000, would be affected. He did not, however, anticipate much distress before March. A report since received shows that while thana Chandil does not at present give reasons for anxiety, distress has suddenly made its appearance in thana Tundi in the Gobindpur sub-division, and the Commissioner of Chota Nagpur writes that it certainly now looks as though the distress in Manbhum were approaching that of 1874. The prospects of the *rabi* crop in this district are poor. With regard to this and the other districts of the Chota Nagpur Division, the Commissioner wrote on the 12th February that the *mahua* was not yet in flower, but that if the weather was favourable that crop might still be a good one.

Hazaribagh.—No material change is reported to have taken place in the condition of the district of Hazaribagh as described in paragraph 8 of my letter of 16th February above quoted, but prices were high, ranging from 8 to 11 seers per rupee.

4. *Orissa Division.*—The Commissioner of the Orissa Division reports that neither in Angul nor Balasore is there any reason to suppose that scarcity is imminent, and he is of opinion that very ordinary relief measures will suffice for both districts. Cuttack

remains in a state of uncertainty, but what is known shows the necessity for watchfulness, especially with regard to the following areas:—

—	Square Miles.	Population.
Sadar sub-division - - - - -	278	208,000
Banki Government estate - - -	117	58,795
Jajpur sub-division - - - - -	324	173,000
Kendrapara sub-division - - -	173	88,400
Kujang Ward's Estate - - - -	320	69,877
Kanika ditto - - - -	265*	85,563
Total - - - -	1,477	683,635

* Exclusive of 174 square miles lying within the district of Balasore.

In Puri distress has made its appearance, and measures of relief are being taken in certain tracts near the Chilka lake, which is also the area in which distress first manifested itself in the great Orissa famine of 1866, but the Lieutenant-Governor is not in possession of precise information relating to the area and population affected.

5. *Bhagalpur, Rajshahi, Burdwan, Dacca, and Chittagong Divisions.*—There is now nothing to add to what was stated with regard to these divisions in paragraphs 11 to 14 of my letter No. 447 Fam., dated the 16th February 1897.

6. Maps of the districts of Nadia and Khulna showing the areas affected, are herewith enclosed.

I have, &c.
M. FINUCANE,
Secretary to the Government of Bengal.

* The programme for this district is not complete.

Agriculture (Famine) No. 778, Calcutta, the 18th March 1897.

From M. FINUCANE, Esq., Secretary to the Government of Bengal, to the SECRETARY TO THE GOVERNMENT OF INDIA, Revenue and Agricultural Department.

Sir,

In continuation of this Government's letters noted below,* I am directed to submit the monthly report, required by section 29 of the Bengal Famine Code, for the period ending the 27th February 1897. Copies of the half-monthly reports of the Commissioner of the Patna Division, No. 491 F.G., dated the 21st February, and No. 687 F.G., dated the 8th March 1897, and their enclosures, together with maps of the Patna Division and of the districts of Khulna, Nadia, Palamau, and Manbhum, showing the affected tracts, are herewith enclosed.

2. The affected districts in the Patna Division continue to be Shahabad in South Bihar and the four districts of North Bihar. The Lieutenant-Governor, accompanied by the Revenue Secretary to this Government and the Commissioner of the Patna Division, Mr. J. A. Bourdillon, recently paid a visit to the districts of North Bihar, which are now the most severely affected districts in this Province. Leaving Calcutta on the 28th February, his Honour reached Bettiah on the evening of the 1st March, and thence drove on the following morning to Ramnagar (28 miles). After inspecting certain relief works there and on the way back to Bettiah, Sir Alexander Mackenzie left for Darbhanga, *viâ* Muzaffarpur, where he arrived on the morning of the 4th March. Two tanks, undertaken as relief works, one under the immediate supervision of the Collector and the other under the Public Works Department, were inspected, and in the afternoon of the same day a conference was held with the local officers of North Bihar to discuss certain questions connected with the operations in progress. The party left Darbhanga on the 5th after paying a visit to the relief works carried on by the Darbhanga Raj at Kamtaul, 14½ miles from Darbhanga, and reached Calcutta on the following morning.

The general result of the inspections held at Ramnagar and Darbhanga was satisfactory, except in the case of a tank near Ramnagar, the site of which had been badly chosen. About 4,000 people were employed on this tank, but practically no task was being exacted, pits were not defined owing to the sandy nature of the soil, and everyone was placed on the penal wage. In the other works inspected by the Lieutenant-Governor, his Honour found that the tasks prescribed in Mr. Glass's tables were being enforced, that these tasks can be performed without undue hardship, and that labourers who were unable, or being able, were unwilling to do the full tasks assigned to them were put either on the minimum or penal wage. Some difficulty was, however, felt by the workers in understanding what the exact task expected from them was, owing to the fact that the tasks of diggers and carriers had not been set out separately in the tables. Further, it was found that the people did not readily form themselves into gangs of 60 persons willing to work together, and that as the whole gang was being fined for the short work of portions of it, discontent arose among individual members of the gangs who, having done a full task, failed to receive a full wage, because of the shortcomings of others. These defects in the matter of exacting tasks and organising gangs necessitated a reconsideration of the details of the system in force, and the following extract from the proceedings of the conference held at Darbhanga shows the steps that have been taken:—

"His Honour explained that the complications arising from setting out the gang tasks took up much of the time of the supervising officers, and expressed the opinion that the gang system did not permit of payments being made to, and fines for short work being imposed on, individuals or a sufficiently small squad of individuals. When the gang consists of 60 persons and a certain number of them do the full task, but others fail to do it, all alike are put on the penal wage. The system thus holds out a premium to idlers, for when all are punished alike for the short work of a portion of their number, it is obviously the interest of all to do as little as they can so long as they get the penal wage. It was arranged that—

"(1.) The tasks of diggers and the tasks and numbers of carriers should be set out separately in Mr. Glass's tables, the full task prescribed for diggers being exacted from

* (1.) No. 455 Agri. (Fam.), dated the 16th February 1897; (2.) No. 609 Agri. (Fam.), dated the 1st March 1897.

diggers, and the number of carriers required as their task to carry the earth excavated by the diggers, and their number regulated according to length of lift and lead. This merely involves a statement of the tasks set out in Mr. Glass's tables in a way that may be readily understood by the workers.

"(2.) It was also agreed that the gangs need not consist of any particular number. The people may arrange themselves into squads of 12 to 16 each. A mate may be appointed over a number of squads aggregating about 60 persons, but for the purposes of payment of wages and assessment of fines, each squad or pit-gang, consisting of about 12 to 16 persons, who are willing to work together, should be a separate unit. Joint responsibility will thus be reduced to a moderate number of labourers who voluntarily combine to work together.

"(3.) It was agreed that the carriers who perform their full task, that is to say, carry the amount of earth excavated by the diggers to whom they have been allotted with due regard to length of lift and lead, should receive the full wage laid down for persons of the class to which they belong (*i.e.*, the wage of A., B., C., D. classes of section 62 of the Code, according as they fall under each of these classes). Women of the D. class may be treated as dependants. Effect will be given to these conclusions by the issue from the Public Works Department of explanatory orders. A muster-roll should be kept on every work showing the names of all persons on the work; abstracts of the roll to be made weekly.

"(4.) It was also agreed that it is to be clearly understood that Collectors and Sub-divisional Officers should visit all relief works in their jurisdiction, and whenever they find anything that requires correction or alteration that they should there and then record in an order book to be kept on the works any instructions they think fit. Such orders should be promptly obeyed by the officer in charge of the work.

"If the Executive Engineer or other superior officer of the Public Works Department differs from the Collector, he should refer any matter in which he so differs to the Commissioner through the Superintending Engineer; but, pending receipt of the Commissioner's orders, the Collector's orders should be obeyed.

"(5.) It was agreed that Charge Superintendents of Relief should also visit all relief works in their jurisdictions, and record such remarks in the order books as they may find necessary. Their remarks will be forwarded to the Assistant or Executive Engineer in charge of the work, who, in case he differs from the Superintendent of Relief, should take the orders of the Collector, and where he differs from the Collector, the orders of the Commissioner. Charge Superintendents of Relief are to be regarded as Sub-divisional Officers within their jurisdictions under section 22 of the Code, save that they will not give orders direct to the 'officers in charge.'"

Another question considered at the Conference was the introduction of the modified system of piece-work suggested in the Government of India's Circular No. $\frac{16}{104-1}$ F., dated the 13th February 1897. It was pointed out that the system is practically one of petty contract, pure and simple. It was thought that this system could not be worked side by side with the task-work system, and it was generally agreed that it is not advisable to introduce it in Bihar on ordinary relief works so long as the establishment available is strong enough to cope with the numbers of relief-workers and to insist on tasks being enforced. The question is under consideration whether the proposed system can be tried with advantage on the railway lines about to be started as relief works in the Patna Division, and on relief works generally in other divisions of Bengal.

3. The following paragraphs deal with the important features of the relief operations in the Patna Division.

Rainfall and Prospects of the Crops.—Light showers of rain fell in all the districts of the Patna Division between the 10th and 12th February, and the figures recorded, including the rainfall in the first week of February, are shown below in comparison with the corresponding figures of 1874:—

District.	Sub-division.	February 1874.	February 1897.
		Inches.	Inches.
Patna	Bankipore	·58	·46
	Barh	1·05	·66
	Bihar	1·93	·98
	Dinapore	·32	·54

District.	Sub-division.	February 1874.	February 1897.
		Inches.	Inches.
Gaya	Average for the district	1·04	1·13
Shahabad	Sadar	1·00	·71
	Buxar	1·00	·86
	Sasaram	1·04	1·33
	Bhabhua	·57	1·17
Saran	Sadar	·87	·39
	Siwan	·77	·38
	Gopalganj	1·75	·35
Champaran	Motibari	1·10	·15
	Bettiah	1·00	·08
	Barharwa	—	·21
Muzaffarpur	Muzaffarpur	·80	·50
	Hajipur	·63	·32
	Sitamarhi	·70	·28
	Shiuhar	—	1·42
Darbhanga	Darbhanga	·89	·31
	Samastipur	·56	·33
	Madhubani	·76	·22

During the second half of February there was no rain anywhere except in Bihar, in the district of Patna, ·05 inch, and in Aurangabad in Gaya ·49 inch. As the rainfall in February was gentle and steady, and was not accompanied by wind or hail, and was rapidly followed by sunshine and a west wind, the effect was most beneficial and improved the prospects of the *rabí* crops, which at the end of the month continued to be good everywhere. Reports of insect pests have been received from a few places, but the damage done is not reported to be great. The reports of the poppy crop are satisfactory on the whole, and a full average crop is expected all round.

Estimates of Area and Population affected.—In Muzaffarpur and Darbhanga there was no change in the area or the population affected.

Shahabad.—In Shahabad a narrow strip of land between the Sone and the Rhotas Plateau, about 30 miles in length and 5 miles at its greatest width, is under observation. In this area the winter rice was a general failure in all villages, and the *rabí* varies, promising a good crop in some and very little in other places. A test work has been opened, and steps to distribute gratuitous relief have been taken, but the tract has not yet been added to the affected area in the district.

Saran.—An area of 16 square miles, with an approximate population of 10,000 persons in thana Parsa, has been added to the affected tracts in the Sadar Sub-division of Saran, so that the total area affected in this district has been raised to 1,442 square miles, with a total population of 1,352,598 persons. In the tract newly affected the *bhadoi* crop was better than in the other tracts previously declared to be affected, and enabled the people to hold out longer. It is reported that they might have continued to do without Government relief had not their *rabí* crop been seriously injured by frost.

Champaran.—The Collector of Champaran reports that certain small tracts in thanas Hardih, Bagaha, and Dhaka, aggregating 83 square miles, should be added to the area at present in need of relief, and he has also revised his previous figures of areas and population. The total area now reported to be affected in Champaran is 1,865 square miles, with an estimated population of 1,110,000 persons, against 1,620 square miles with a population of 972,000 persons previously reported.

4. *Relief Works.*—The transfer of large works to the management of the Public Works Department, which commenced towards the latter end of January, was in progress during the month under report, the number of works open at the end of February in each district being—

—	Under the Public Works Department.	Under Civil Officers.	Total.
Saran	2	34	36
Champaran	12	54	66
Muzaffarpur	3	45	48
Darbhanga	13	91	104
Total	30	224	254

To these must be added four works under the civil officers in the district of Shahabad. The total number of works open at the end of January was 191. In consequence of the want of a sufficient number of officers to take charge of relief works and other causes, the progress made in taking over large works by the Public Works Department was slow, and arrangements to supply the district officers regularly with information as to the numbers employed, and other particulars relating to the works transferred were not complete. The Government of India has, therefore, been separately solicited to help this Government in recruiting a further staff of "officers in charge." The figures reported to Government as to the average daily numbers on relief works in the last week of February, which are shown below in comparison with the figures at the end of January, are not therefore quite accurate :—

	Daily Average Number of Male Units.	
	January.	February.
Saran	10,132	10,572
Champaran	76,010	74,166
Muzaffarpur	8,198	19,733
Darbhanga	92,220*	91,000*
Total	186,560	195,471

* Includes numbers on the relief works of the Darbhanga Raj.

The average daily number of male units employed on the four relief works in the Bhabhua Sub-division of Shahabad in the last week of February, was 845. The fall in the numbers in Champaran and Darbhanga is reported to be due to task-workers having been drawn off to the harvesting of the *rabi* crops, and to the temporary closing of works required for their transfer to the Public Works Department. The latest weekly returns again show a large increase in the number of relief workers in this district. The number in Muzaffarpur commenced increasing from the beginning of February, and is now more than double the number at the end of January, and a very much larger increase is expected in April.

The following table shows the average wages paid, tasks exacted, and cost rate per 1,000 cubic feet of earthwork in the several districts during the second half of February, in comparison with the corresponding figures for January :—

District.	Average Daily Wage.				Work done per Diem on Task Work.		Cost, Rate per 1,000 Cubic Feet.	
	Second Half of January.		Second Half of February.					
	Task Work.	Irrespective of Task.	Task Work.	Irrespective of Task.	Second Half of January.	Second Half of February.	Second Half of January.	Second Half of February.
1.	2.	3.	4.	5.	6.	7.	8.	9.
	Rs. A. P.	Rs. A. P.	Rs. A. P.	Rs. A. P.	c. ft.	c. ft.	Rs. A. P.	Rs. A. P.
Saran	0 1 2	0 1 2	0 1 5	0 1 6	27⅓	50⅔	2 13 4	2 4 0
Champaran	0 1 3	0 1 8	0 1 5½	0 1 9½	13⅓	23¼	5 11 6¼	3 15 5½
Muzaffarpur	0 1 4	0 1 9	0 1 4½	0 1 9½	74	66·77	1 1 11	1 4 8
Darbhanga	0 1 5	0 1 4	0 1 5	0 1 7	31	32·6	2 13 6	2 11 5
Shahabad	0 1 7	0 1 7	0 1 10	0 2 1	34	49	2 15 4	2 6 5

These figures show satisfactory improvement in all the districts. It is to be remembered that the number of cubic feet per day shown in column 7 does not represent the quantity excavated by diggers, which would be very much larger, but the average number of cubic feet per unit *dug and carried*. Where, as in Champaran, the lead and lift in large and deep tanks are long, the average quantity of earth dug and carried per unit is necessarily smaller and the cost rate per 1,000 cubic feet greater than where, as in Muzaffarpur, the work consists chiefly in repairs and construction of roads. The rates of wage at the end of February were nearly the same everywhere, though rather high in Shahabad, and there was an increase in the average outturn of work, and a consequent decrease in the cost rate per thousand cubic feet, except in the case

of Muzaffarpur. In this district the tasks previously demanded were in excess of those laid down in the tables of tasks drawn up by the Honourable Mr. Glass, Secretary to this Government in the Public Works Department, which has been circulated with that Department's Resolution No. 520 M.P.—I., dated the 25th January 1897, and a copy of which is hereto annexed for ready reference, with copies of the supplementary instructions* since issued by the Public Works Department. The reduction in the outturn of work per male unit with the consequent increase in the cost rate per 1,000 cubic feet in Muzaffarpur is the result of the introduction of Mr. Glass's tables in this district as elsewhere. As explained in the note prefixed to the table, Mr. Glass's method of calculation is that he has taken the amount of work done by labourers under contractors on ordinary works, and has deducted from it an allowance of two-fifths on account of the special conditions governing the work of famine labourers, leaving three-fifths or 60 per cent. of the amount of work ordinarily done by professional coolies as the task laid down for relief-workers. Sir Alexander Mackenzie considers this to be a reasonable if not a severe test of distress. He found in one of the tanks inspected in Bihar that the full tasks were being done by no less than 95 per cent. of the pit-gangs, and this was in work supervised by Mr. Blackwood, a junior civilian. It is, in his Honour's opinion, incredible that cultivators or others not ordinarily accustomed to work as professional labourers would come to and stay on relief works, and perform the task assigned in Mr. Glass's tables for the miserable pittance of $1\frac{1}{3}$ annas a day, which is little more than half the ordinary wage in ordinary times, when prices of food-grains are half what they now are, unless they were driven to do so by acute distress, and it is also incredible that professional labourers would remain on these works at these rates if they could obtain employment on more remunerative terms elsewhere.

His Honour thinks the performance of these tasks (which are heavier than those prescribed in the Famine Code) is conclusive evidence of widespread and severe distress in Bihar; but Sir Alexander Mackenzie has no means of judging whether the tasks thus laid down are adequate or excessive, in comparison with the tasks which are being exacted elsewhere, and it would be helpful to this Government if the Government of India could furnish it with information regarding the tasks demanded, and actually found capable of being enforced as tests of distress in other Provinces.

5. *Private Relief Works.*—In Shahabad three tanks have been undertaken, one by the Courts of Wards and two by private individuals, but no figures for them have been supplied. In Saran, besides works under private individuals in the Siwan and Sadar sub-divisions, the Hatwa Raj has 10 works open in the Gopalganj sub-division, which employed during the week ending 25th February a daily average number of 2,938 male units on task work, and of 1,240 units on work irrespective of task. In Champaran there were two works undertaken by the Bettiah Raj and two by the Tettaria and Bala indigo factories, the average daily number employed on the four works being 11,801. The Darbhanga Raj is carrying on relief operations in the districts of Muzaffarpur and Darbhanga. In the former district the total number employed on the Raj works on the 27th February was 3,041, and in Darbhanga the total number on seven works was 21,900. The Collector of Darbhanga reports that besides the Raj works a very large number of tanks, employing about 30,000 labourers, are being excavated by private individuals in the north-east of the district.

Poor-houses and Village Relief.—Including the district of Patna, in which the only kind of relief which was being given was that distributed at a poor-house and to a small extent by gratuitous relief, the total number of Government poor-houses open in February was 16 and in Motihari one has been opened since the close of the month, while kitchen relief was given at four places in Saran and at several places in Champaran. Four private poor-houses are conducted by the Hatwa Raj and another by the zamindars of Manjha in the district of Saran. The Darbhanga Raj has a poor-house in the district of Muzaffarpur and some kitchens in the district of Darbhanga. It is reported from Champaran that no arrangements for giving special employment to weavers, artisans, &c., have been found necessary. Cotton was given out to *pardanashin* women to be spun into thread in return for gratuitous relief, but no information as to the results has been furnished, except that one Charge Superintendent has found that, including the cleaning of cotton, a woman takes about 10 days to spin a seer of cotton into thread. In Darbhanga cotton was distributed in most circles, and in one of the charges it was being made into cloth. Another form of employment given in this district was basket-making. No detailed information has yet been furnished.

* Public Works Department letter to the Commissioner of the Patna Division, No. 1661 M.P.—I., dated the 16th March, 1897, with enclosures.

His Honour found, on inspecting the Bettiah poor-house during his recent tour, that of 760 inmates 304, or 40 per cent. of the total number, consisted of waifs and strays from the neighbouring district of Gorakpur, who had been picked up by the police or the relief officers aimlessly wandering in a more or less emaciated condition. I am to invite the attention of the Government of India to the remarks made in paragraph 40 of the Commissioner's report dated the 8th March.*

7. *Gratuitous Relief.*—The following table shows the average daily doles of gratuitous relief for the second half of February in comparison with the corresponding figures for January :—

District.	Second Half of	
	January.	February.
	As. P.	As. P.
Saran	0 9	0 8
Champaran	1 0⅛	0 9¼
Muzaffarpur	2 0	0 10
Darbhanga	2 8	0 10
Shahabad	1 5	0 10

The dole in Muzaffarpur and in Darbhanga has been reduced in accordance with the orders of Government, the doles at first reported having been excessive.

The numbers in receipt of gratuitous relief have increased considerably, the increase being most marked in Muzaffarpur and Champaran. In the former district the total number at the end of January was 318 while the corresponding figure for February is 11,219. This advance is attributed by the Collector to an increase of distress, and the Commissioner thinks that it is also due to the better development of circle organisation and a more careful inspection of the villages. In Champaran the number on gratuitous relief rose from 6,019 at the end of January to 37,333 at the end of February. This is due to the completion of the circle organisation, to the relief works having been cleared of a large number of D. class labourers who have been placed on gratuitous relief, and to the development of distress which, as already reported, must continue to increase in Bihar till the latter end of June. The percentages of the numbers relieved gratuitously in the most distressed districts of North Bihar to the total numbers relieved, as given in paragraph 72 of Mr. Bourdillon's letter of 8th March 1897, are as follows, the corresponding percentage for the whole division being 41·91 :—

Saran	56·83
Champaran	27·19
Muzaffarpur	64·49
Darbhanga	37·81

The numbers shown in the present report as gratuitously relieved should, following the classification adopted in the North-Western Provinces and recently prescribed by the Government of India for Bengal, be taken to include all the three heads noted below.† The numbers in receipt of gratuitous relief were apparently high, but not higher than in the neighbouring Provinces of the North-West and Oudh. The total number on gratuitous relief in the 19 distressed districts of the North-Western Provinces on the 27th February, as shown at page 272, Part I., of the "North-Western Provinces Gazette" of March 6th, was 518,188; the total number relieved being 1,515,124, the percentage of the number on gratuitous relief is 34·2. The corresponding figures for the Patna Division (excluding the district of Gaya), as given in the weekly telegraphic reports for the 27th February, are :—

Relief works	243,492
Gratuitous relief	136,788
Total	380,280

* "A considerable number of wanderers have found their way into this district (Champaran) across the Gandak from the North-Western Provinces, and on the 3rd March, when the Lieutenant-Governor visited the Bettiah poor-house, out of 760 inmates 304 were from those Provinces. Considering that these invaders also supply the bulk of the vagrants picked up by the police, both here and along the Grand Trunk Road in the Shahabad District, it might be as well to inquire what arrangements are being made in the border districts of those Provinces for the relief of their poor. The Collector will be asked to ascertain, if possible, what number of immigrants from the North-Western Provinces are to be found in the Trans-Gandak thana of Madhubani. He was at one time afraid that relief works would have to be opened in that area solely for the benefit of these people."

† Relieved as dependants. Relieved in poor-houses. Relieved under other provisions of the Code.

The percentage of the number on gratuitous relief to the total number relieved is therefore 35·9. But this percentage is not quite correct, for the figures of relief workers in the district of Darbhanga do not include figures for certain works under the Public Works Department in the Madhubani sub-division. Were these figures complete, the percentage would probably be about the same as that in the North-Western Provinces and Oudh.

In Saran and Shahabad the numbers gratuitously relieved are large compared with the numbers on relief works, because the male working members of families in these districts have gone to seek employment in Eastern Bengal and elsewhere. In Saran the Collector reports that several cases have been brought to light of people becoming emaciated almost to the point of starvation without applying for gratuitous relief or having recourse to relief works. "The disinclination," he adds, "to apply for "gratuitous relief can be understood, and this is the chief difficulty which circle "officers have to combat." Cases of this sort, in which laudable self-respect deters respectable people from voluntarily becoming State paupers, are precisely the cases which deserve the greatest sympathy, and which it is necessary for the circle officers and relief committees to search out in the villages.

The Darbhanga Raj was distributing gratuitous relief to 10,518 persons during the week ending 27th February.

8. *Physical Condition of the People, &c.*—The public health continues to be exceptionally good, and no authenticated cases of starvation have come to notice.

The following table shows the death-rates for the months of November, December, January, and February of the present and three preceding years:—

District.	Years.	Death-rate per 1,000 of Population.			
		November.	December.	January.	February.
1.	2.	3.	4.	5.	6.
Patna	1894	4·37	3·67	2·22	1·53
	1895	2·82	2·93	2·24	1·44
	1896	2·11	1·93	2·19	3·13

It will thus be seen that the year is a particularly healthy one in Bihar, and that the reported percentage of deaths is below rather than above the normal, and markedly below that of the preceding year.

The facts mentioned in paragraph 4 above show, in his Honour's opinion, that there can be no question that distress is acute and widespread in North Bihar. The table of mortuary statistics given above in this paragraph shows that the distress has been so far adequately met, and that the local officers have discharged fully and efficiently the

duty imposed upon them of preventing increase of mortality from starvation. Hence it is that Sir Alexander Mackenzie recently expressed to the local officers his entire satisfaction with the results so far attained.

The condition of the cattle is reported to be good everywhere.

9. *Loans.*—Loans for village works, amounting to Rs. 3,500, were granted in the district of Saran during the period under report. Applications for advances were received in certain other districts, but the offer made by Government to give loans on advantageous terms does not appear to have so far proved attractive.

10. *Food-stocks, Importation of Grain, and Prices.*—During the four weeks now under report, the total imports of food-grains are reported to have been 5,51,769 and the exports 1,84,456 maunds, against 7,71,186 and 3,75,650 maunds respectively in January. The imports exceeded the exports by 3,67,313 maunds, and no scarcity of grain has been reported from any of the affected districts. Burma rice is stated by the Collector of Saran to be obtainable in all the large marts in the district, and the Collector of Champaran writes that it is now penetrating right into the interior. In the latter district the local grain-dealers are moving in the matter of importation, and have expressed their readiness to go on importing so long as they can do so at a profit. The Collector of Champaran writes that all officers report that there is no present apprehension of stocks getting depleted. The Secretary of the Bihar Indigo Planters' Association, on the other hand, has quite recently reported that coolies are coming to him with complaints that though they have money to purchase grain they are unable to obtain it. The price of rice is reported to have been steady during the month under report; that of Indian corn, however, rose a little, as the stock of this grain was being exhausted. Though the *rabi* crop has been, and is being harvested, the tendency of prices at the present time generally in Bihar is still upwards His Honour the Lieutenant-Governor, however, thinks that so long as the supply of rice from Burma lasts, no fear need be entertained of its not finding its way to North Bihar.

The following paragraphs deal with the other divisions in Bengal, which were last reported on in my letter No. 609 Fam., dated the 1st March 1897:—

11. *Presidency Division.*—The most severely affected districts in the Presidency Division are at present Nadia and Khulna.

Nadia.—There was a small increase in the affected tracts, the condition of which has undergone a slight temporary improvement in consequence of the harvesting of the *rabi* crops. There was rain on the 16th, 17th, and 18th February, which will enable the people to prepare lands for the next *aus* or autumn crop. There were 14 relief works open, eight under the Public Works Department and six under the civil officers; of the latter four were tanks and the rest roads. The total number of persons employed at the end of February was 6,873, while the corresponding figure for January was 8,229, employed on five works. This falling off is probably due to the temporary improvement already noticed. The cost per 1,000 cubic feet and the daily wage in this district were high, being for the second half of the month Rs. 3-3-3 and 2 annas 5 pies respectively.

The total number on gratuitous relief is reported to be 703. In return for this form of relief women are required to twist jute into string. Thread has been distributed to a few families of weavers. Rice was being imported in considerable quantities into the affected tracts. Public health and condition of cattle continued good. During February the total amount of loans sanctioned under the Land Improvement Loans Act was over Rs. 45,000, but the amount actually paid was Rs. 3,650.

Khulna.—The area affected in the district of Khulna was 442 square miles, as before. It is reported that the general condition of the affected area has deteriorated. Four relief works were open against three in January, and the number employed had risen from 147 in January to 583 at the end of February. The numbers on gratuitous relief also rose to 1,949 from 142 at the end of January. Widows and orphans, it is stated, show signs of emaciation, and two deaths, alleged to be due to starvation, have been reported. The correctness of these reports is, however, still under inquiry. Public health is fair, as also the condition of cattle. The total amount advanced under the Land Improvement Loans Act is reported to be Rs. 19,890.

Jessore.—Of the two tracts in Jessore, mentioned in my previous letter, there has been no improvement in thana Muhammadpur, but the condition of the tract in thana Bangaon has materially improved, owing to recent rainfall. The prices of common rice showed a tendency to fall, and food-stocks were being supplemented by importation.

A test work was opened, but did not attract labourers. Some gratuitous relief was given, the total number in receipt of such relief at the end of the month being 712.

Murshidabad.—In Murshidabad distress is reported to have made its appearance in a tract covering about 80 square miles, with a population of 42,000, lying partly in the Sadar and partly in the Kandi Sub-division. The total area likely to be affected in this district is reported to be 280 square miles, with a population of 160,000, including the 80 square miles above mentioned. Winter rice is the principal crop grown. There was a partial failure in 1895–96, the outturn of the *aman* and *aus* crops being eight and nine annas respectively. During the last season the estimated outturn of the *aman* for the whole district was nine annas and that of *aus* eight annas. The *rabí* crop in the area above mentioned has been very poor, and in places a complete failure. The export of grain from this to other districts and the North-Western Provinces has been unprecedented, and it is feared by the Collector that the stocks in hand will not be sufficient for the requirements of the district up to September. Test works have been opened, and the numbers employed on them are reported to be rising. As far as the information now before this Government goes, no gratuitous relief was being given.

24-*Parganas.*—The position in the 24-Parganas remained unchanged.

12. *Chota Nagpur Division.*—Of the districts in the Chota Nagpur Division there seems, so far, to be no need for any apprehension with regard to Lohardaga, while in Singhbhum the prospects continue to be altogether reassuring. With regard to the division as a whole, the Commissioner writes that the rain which fell in February was fairly general, and has been of decided benefit to the *rabí* crops without at the same time doing any material harm to the *mahua*. Mr. Forbes writes that the latter now gives promise everywhere of at least a full average outturn, provided the weather continues favourable. At the date of the report the *mahua* trees were beginning to blossom, and rain would be injurious to the crop. There appears to be some increase in emigration. Public health is good. Cattle-disease is reported from Manbhum and Palamau, but not to any unusual extent.

Palamau.—Distress in Palamau is turning out to be less acute than was at first anticipated by the Commissioner. The worst portion of the district comprises the jurisdiction of Garhwa, Daltonganj, Balumath, Latehar, and Patan thanas, with the outposts of Untari, Lesliganj, Panki, Chandwa, Ker, and Manatu, the area being 2,563 square miles. The total population of this tract is 383,440 persons, of whom the Deputy Commissioner thinks that 10,000 may be set down as the number affected. Relief is being given by employment on relief works and by the distribution of gratuitous relief. In the beginning of February there were five works open, employing in all 745 persons. At the end of the month there were nine Government relief works, and the total number shown as employed on them on the 26th February is 4,287. All are paid for task work, the rate per 1,000 cubic feet being Rs. 2–3, and the average wage earned per male unit is about 2 annas. The Commissioner reports that, so far, there are no signs of any rush on the relief works. It is also reported that several well-to-do zamindars of the district have opened relief works, some of which appear to have been undertaken with advances granted under the modified rules under the Land Improvement Loans Act, the total amount thus advanced in Palamau as first instalments being Rs. 3,333. Exact figures are not known, but the Deputy Commissioner thinks the numbers employed on these works cannot fall far short of 2,000.

The number on gratuitous relief in the beginning of February was 333; by the end of the month it had risen to a daily average of 514. The average daily dole per male unit amounted to 1 anna 1 pie. Up to the end of the period under report only one trader had taken advantage of the bounty of 8 annas a maund offered by Government in aid of the importation of grain, and had imported 658 maunds of rice, and been paid Rs. 329. There was a slight revival of exports from Lohardaga, the returns showing that 1,648 bullocks came away with rice from Lohardaga and Chainpur marts during February. Prices, however, continued very high.

Manbhum.—The areas now affected in the district of Manbhum aggregate 885 square miles, with a population of 268,692 persons, lying in thanas Gobindpur, Tundi, Nirsha, and Chas. Relief in this district was still at the test work stage. There were 11 test works, seven within the affected tracts and four in other places. The first test works were opened in the Gobindpur Sub-division on the 30th January, and on the 31st the total number employed was 180. At the end of February the number had risen to 3,492, and since then it has again increased considerably. The labourers are paid at piece-work rates varying from Re. 1–4 to Re. 1–9, and in two cases of tanks to Rs. 2–3

per 1,000 cubic feet. The daily wage earned per mule unit varied from 1 anna 4 pies to 2 annas ¼ pie. The Deputy Commissioner, Mr. Luson, writes that the test works opened have not been attended by as many workers as he had expected, and he concludes that the reports which he had received about the destitution among the labouring classes were somewhat exaggerated. Small works such as *bunds* and tanks were being carried out by private individuals throughout the district, but no figures have been furnished as to the number employed on them.

Complete figures have not been furnished as to the numbers on gratuitous relief. The Deputy Commissioner estimates the total number in receipt of this form of relief on the 27th February at 5,000.

Considerable quantities of grain were being imported into the affected tracts, and food-stocks are reported to be sufficient for the present.

Hazaribagh.—There were isolated cases of distress, but no general call for assistance in the district of Hazaribagh during the period under report. The Deputy Commissioner was on tour throughout the south of the district, and found people able to get on without assistance except at a place called Gumeah, with an area of 10 square miles and a population of 6,000. Test works were open in many places, but were not attended by any considerable numbers. Eighty-five persons were in receipt of gratuitous relief. Cotton was distributed in the town of Hazaribagh and elsewhere to be spun, but no information has been furnished as to the results. The Deputy Commissioner expects to have about 10,000 persons employed on relief works scattered over this district during the next three or four months.

13. *Bhagalpur Division.*—The two districts threatened with distress likely to require assistance from Government are Bhagalpur and the Sonthal Parganas. Particulars relating to both the districts were given in paragraph 11 of my letter No. 447 Agri., dated the 16th February 1897.

Bhagalpur.—Two relief works were open in thana Bongong, in the Madhipura Sub-division. The number on one of these on 27th February was 5,828, with 295 non-working children, and on the other 375. In the Supaul Sub-division two works were open under Government, besides works undertaken by zamindars. The total number on the Government works in the Supaul Division on the 27th February was 1,593, with 34 non-working children. No gratuitous relief was given in either sub-division beyond allowances on account of non-working children.

Sonthal Parganas.—In the Sonthal Parganas distress has appeared in the north and north-west part of the Jamtara Sub-division, comprising an area of about 350 square miles, with a population of 93,000. The estimated number likely to need relief is 10,000 on works and 1,200 on gratuitous relief. Measures have been taken to afford relief to the needy.

14. *Orissa Division.*—There is nothing of importance to mention with regard to Angul and Balasore, except that the rain which fell in the middle of February benefited the standing crops. Prices were stationary. The Collector of Cuttack reports that the condition of the people generally is better than he had hoped for at this season. He anticipates little trouble before May, and even then sees no reason to fear anything like widespread distress.

As regards the district of Puri, this Government is not yet in possession of complete information. The timely rain in February is reported to have saved the standing crops and given field employment to labourers. The general aspect of the tracts adjoining the Chilka Lake is also said to have slightly improved. The Commissioner has been requested to proceed to the place and arrange for such measures of relief as may be necessary.

15. There is nothing of importance to report with regard to the Burdwan, Rajshahi, Dacca, and Chittagong Divisions.

16. There has been some delay in the submission of this report, owing to non-receipt in time of some of the Commissioners' reports.

I have, &c.

M. FINUCANE,

Secretary to the Government of Bengal.

(a.) The account is not yet made up.

* The figures in columns 2 to 6 are for the whole district, as no particular portion of it can be said to be affected.

† The figures in columns 3 to 5 include 73 miles of the proposed railway from Bairagnia to Bagaha, which would give employment to about 14,120 persons for three months.

‡ The figures in columns 8 and 9 do not include works under the Public Works Department.

PUNJAB.

REMARKS to accompany IMPERIAL MONTHLY FAMINE STATEMENT A. for the Five Weeks ending Saturday Evening, the 30th January 1897.

HISSAR DISTRICT.

Much private relief has been given in an unsystematic way by the indiscriminate distribution by charitably disposed persons of grain doles to all comers. In a few villages the Ját owners have taken on themselves the duty of keeping their menials alive. Under Rs. 15,000 have been promised and are being collected by public subscription in the larger towns and villages. A Central Famine Committee for the district and local committees for the outlying towns such as Bhiwáni have been organised under section 261 of the Code.

Gratuitous relief in villages has been started in tahsils Sirsa and Fatahabad and has been given in isolated urgent cases in other parts of the district.

Gratuitous relief both from Government and private funds is being distributed according to instructions issued by the Deputy Commissioner.

There are three poor-houses in Sirsa, Fatahabad and Bhiwáni, but the attendance is still small. The people dislike the restraint. The Deputy Commissioner is arranging for a poor-house to be opened in Hissar.

The large relief works on which the majority of labourers are engaged are the two Ghaggar Canals, the Bhiwáni water tanks, the Hissar-Barwála road, and the Fatahabad-Tohána road. These afford approximately relief to 37,000 people. All except the last are in full working order, and the arrangements and discipline are satisfactory.

The last mentioned has only recently been opened, and the arrangements have not had time to settle down. There are in addition several smaller works on hand, viz., the repair of small roads and the excavation of village tanks.

The physical condition of the people is good but the destitution is more keenly felt and signs of distress are weekly more apparent. One striking proof of this is the large number of Bishnois and Játs of good caste who are coming to the works. On the Fatahabad-Tohána road there are over 1,000 Bishnois now at work.

Three deaths from starvation have been reported. Only one has been authenticated. The other two have turned out to be false. The average death-rate is abnormally low.

Food stocks were exhausted some time ago. There are two proofs of this: (*a*) The large numbers of applications to prosecute dealers for selling unsound and diseased grain, and (*b*) the large number of imports compared with exports of grain by the Rájputana-Málwa Railway Stations in this district. For the week ending 6th February the imports were 17,700 maunds and exports 1,500 maunds.

The *rabi* crops on irrigated lands are in a very ordinary condition and the unirrigated crops are almost nil.

Famine wages have fallen practically by one pice in each class owing to the good prospects of the *rabi* harvest in the Punjab proper.

The condition of the cattle left alive is very poor. The Muhammadan Pachádás and Ranghars and the menial castes are killing their own cattle and those of other people that come into their hands.

ROHTAK DISTRICT.

1. *Private Relief.*—In some of the towns and villages of the district small sums are given in private relief. The total amount of subscriptions collected and credited

under section 258, Famine Code, amount to Rs. 1,367–8–0, and a committee has been appointed for the management of the fund.

2. *Village and Poor-house Relief.*—There are no poor-houses established as yet, but the affected area has been thoroughly examined and gratuitous relief is given through Lambardárs to all persons entitled to it.

3. *Relief Works.*—Relief works are at present all small works with the exception of the Jhajjar-Kosli road and consist chiefly of excavating village tanks.

4. *Physical Condition.*—The physical condition of the people is good, and no deaths from starvation have occurred, nor have any cases of serious debility from want of food been noticed.

5. *Food Stocks.*—It is hard to get reliable information as to food stocks, but so far as can be ascertained they are sufficient for two or three months' supply.

6. *Import and Export.*—Grain seems to be freely imported as required from Delhi and Gurgaon, also from Bhiwáni in Hissar District.

7. *Rabí Prospects.*—*Rabí* prospects are uncertain. Although practically no baráni crops have been sown, the irrigated area sown is larger than has ever been sown before. On well-irrigated lands the crops are at present doing well, but rain is necessary to fully develop them properly. Canal-irrigated crops promise well, but with them too rain would greatly increase the outturn. At present the village menials and purely labouring classes only are affected, and it depends on the *rabí* harvest whether distress will extend to agriculturists.

Gurgaon District.

This district has been singularly exempt from famine. The cultivators except in the Rewári and part of Gurgaon Tahsils are doing well, and the *rabí* prospects in Palwal, Firozpur, Nuh, and in part of Gurgaon are splendid.

In Rewári owing to want of rain the area under *rabí* has been contracted, but the crop on irrigated lands is good. Only in this tahsil and in part of Gurgaon, owing to a poor *kharíf* and the high prices prevailing, the kamíns are badly off, as there is no work for them in the fields, and relief work in the shape of tank clearing has been given to them.

General health of the district is excellent and the physical condition of the kamíns is good so far. No case of death from starvation has occurred amongst them.

At Rewári and Farukhnagar private relief has been started. In Farukhnagar Rs. 838 has been subscribed, and up to 30th January 1897 Rs. 299 has been spent in providing food for 60 women, 14 men, and two children. At Rewári Rs. 1,451 was subscribed, and arrangements are being made to distribute food to those in the greatest need.

Food stocks throughout the district are sufficient. The following figures will show for the week ending 30th January the importation of grain :—

——	Imported by Rail.	Exported by Rail.
Week ending 30th January 1897 -	Maunds. 5,328	Maunds. 899

High price of food grains has caused no change in the rate of wages. The only important work which has been started as a relief work in the Gurgaon Tahsil is the Gurgaon-Bahora road *viâ* Kasan, which it is estimated will employ 500 persons for five months.

Delhi District.

In Delhi city the amount of private relief is growing less, as the municipal relief works have drawn the helpless people out of the city.

The poor-house relief in the city of Delhi grows greater; only such persons are fed who are utterly unable to do any sort of work.

The physical condition of the people is fair; there are scarcely any signs of emaciation from want.

Food stocks are sufficient and are being supplemented with imports from other districts.

The prospects of the affected area are not improved. There has been no rain, and the *rabí* crop will not be even as large as was previously expected.

There was no change in rates of wages, but during February they will probably be reduced.

There has been no special mortality or increase in the death-rate.

Karnal District.

A General Committee for the management of the subscription fund collected in this district for the relief of the poor and needy has been formed and gratuitous relief started in the town of Karnál and on a small scale in villages in the district. The total receipts from private subscription amount to Rs. 6,808–10–0 up to date, and the expenditure to Rs. 572–7–9.

No poor-houses have yet been started in this district.

Two large relief works are in progress in this district,—one in the tahsil of Karnál in the heart of the Nardak, viz., raising and improving Karnál-Asandh road, and the other in the Kaithal Tahsil, construction of the Kaithal Branch from the Sarsuti Canal. The daily average number of labourers employed on these works amounts to 2,351.

The health of the people continues to be good. There is still sufficient stock of grain in large villages, but in smaller villages it is quite exhausted.

Fifteen thousand eight hundred and twenty-seven maunds of grain have been imported into the district during the month under report.

The condition and prospects of the famine remain just as before, and the little rain that has recently fallen has in no way affected it, though it is calculated to be beneficial to the standing crops.

No changes in the rates of wages were made during the month, the prices of food-grains being almost stationary. They fell only slightly during the last two weeks of the month at head-quarter towns, but this did not affect the local prices current at the places where the works are being carried out.

The actual death-rate during the month is below the normal of previous years.

Umballa District.

1. There was no private village or poor-house relief.

2. So far relief works have taken the form of village tanks in the district and relief works for spinners in the Umballa City. A fairly large relief work financed by Government in the Public Works Department will give employment to 3,000 labourers for at any rate three months. It is being started from the 1st February.

3. The zamindars are able to hold their own. They have been greatly encouraged by the recent rain. They are able to consume their food stocks without much anxiety. The Kamín classes (by which is meant the village classes owning no land) have been reduced to the last stage of destitution, but the able-bodied can get labour to feed their families. The decrepid and old are face to face with actual starvation, feeding principally on wild products of the soil. Efforts are being made to prepare lists of these persons within the circles of Circle Inspectors and to bring them on the gratuitous relief list, as relief works cannot be made local enough to accommodate them.

4. The general condition and prospects of the affected area will remain the same till next monsoon, although the *rabí* harvest will create an interlude. Improvements in agricultural prospects have been too slight to make the landowners actually easy, and until they are easy the rural non-agriculturists must remain in distress.

5. The rain caused a change in prices, which will ease tension not a little. Wheat has, in at any rate one rural tract, fallen to 10 seers and maize to 12. After the last fall of rain telegrams ordering sales were plentiful.

Ferozepore District.

Subscriptions have been collected in municipalities for private relief, also in villages of Moga Tahsil.

There are no poor-houses.

The relief works now in progress are composed of kankar quarries under the Public Works Department and small works under the District Board and municipalities. They are sufficient to relieve the distressed population of the district.

The physical condition of the people is good. There is an abundant supply of grain—

Exports - - - - -	32,761 maunds.
Imports - - - - - -	1,705 „

The rain of January 13th will ensure a fair *rabí* harvest, and the prospects of the district are by no means gloomy.

Wages are calculated on 13 seers in Ferozepore municipality, 12 seers near other towns, 11 seers in outlying regions.

Lahore District.

(1.) *Private Relief.*—In the Lahore municipality a sum of about Rs. 18,000 has been collected by the citizens to provide relief to the poorer classes of Lahore. In Kasúr municipality about Rs. 2,000 have been similarly collected.

(2.) *General Character of Relief Works.*—At Kácha near the Kána Kácha Railway Station in Tahsil Lahore the silt clearance of a pacca tank was commenced on the 2nd January 1897 as a relief work. In the Lahore municipality the relief work consisted of the raising of two or three plots of nazúl land situated near the Upper Mall in the Civil Station. Work commenced here on 21st December 1896.

(3.) Physical condition of the people in affected tracts is good up to the present, and there is no disease and no visible emaciation.

(4.) Food stocks are sufficient, and grain is being introduced into the district from Sind and from the Chenab Canal tracts.

(5.) The general condition and prospects of the affected area are not very hopeful. In baráni lands no rain fell at the proper time, and therefore no crops were cultivated.

(6.) *Changes in Rates of Wages.*—At Kácha, when the work was first started, the wages were fixed on the price of makki (Indian corn) which was 9½ seers per rupee. From the 23rd January 1897 there was a reduction made in the wages, as the price of makki fell from 9½ to 11 seers per rupee. A reduction is also being made in the Lahore municipal relief work for similar reasons.

Gujrat District.

Large Work—Jhelum Canal.—Gratuitous relief given under section 140A: average attendance 890. Physical condition of labourers good and of the population generally fair, the poorer classes suffering as before. Owing to the winter rains, which it is hoped will save the *rabí* crops sown, prices are a little easier, but still rule high. Grain is imported in sufficient quantities. At present no change in the rate of wage has been found necessary.

There have been no serious cases of sickness on the works.

No. 508, dated Lahore, 17th March 1897.

From M. W. FENTON, Esq., Revenue Secretary to Government, Punjab and its Dependencies, to the SECRETARY TO THE GOVERNMENT OF INDIA, Revenue and Agricultural Department.

Sir,

In continuation of my letter No. 341, dated the 19th February 1897, I am directed to submit, for the information of the Government of India, the Monthly Famine Report of the Punjab for the month of February 1897 in the form of the two prescribed Statements A. and B. and the accompanying map.

2. I am to point out that the death from starvation reported from Hissar last month has since been found to have been one of suicide. In regard to the two deaths reported from the same district this month, I am to observe that both the deceased were immigrants. One of these was a woman in whose case starvation was merely a contributory cause of death, as she really died from pneumonia. Further inquiry is being made as regards the other case.

I have, &c.
M. W. FENTON,
Revenue Secretary to Government, Punjab.

Imperial Monthly Famine Statement A. for the Four Weeks ending Saturday Evening, the 27th February 1897.

REMARKS to accompany IMPERIAL MONTHLY FAMINE STATEMENT A. for the Four Weeks ending Saturday Evening, the 27th February 1897.

HISSAR DISTRICT.

A few drops of rain fell during the month not sufficient to lay dust.

The few crops on *baráni* lands in the south of the Hissar and Bhiwáni Tahsils which were sown after the rain of 28th December are fast withering. The prospects of the crops on *saílába* lands are very poor. The crops on canal-irrigated lands are, taking the district as a whole, in fair condition.

Grain stocks are practically exhausted, and food, principally *jowár*, is being imported from Sind. These imports have fallen off lately owing, it is believed, to the fall in prices in February and to the dislocation of the Karáchi trade caused by the plague. But the imports are again showing a slightly upward tendency, and traders assure the local officers that it will be long before the Sind stocks are depleted. Imports during the month have been 101,436 maunds, and exports 8,757 maunds.

The fodder stocks are nearly exhausted and are being replenished in some parts by imports from the canal villages in the Native States to the north.

The condition of the cattle is becoming worse every day. Many are dying for want of food and many are being slaughtered by Pachádas, Ránghars, and the menial castes. Even the camels now are showing signs of want.

The people are beginning to show distinct signs of want, those on relief works looking better than any others. Hitherto Government has been successful in saving people from dying of hunger, but—except in canal villages—emaciated figures are to be seen. This is specially noticeable in the villages.

The physical condition of the workers is not so good as it was, but this may be partly due to the late fast which so many of the Muhammadan labourers observed. However, their condition gives no cause for anxiety. They are well looked after.

The Ghaggar Canals, the Bhiwáni Waterworks, and the Rangoi Cut will all finish before the end of April in all probability. This will throw over 30,000 people on our hands. Work will probably be provided on the Ghaggar Canal roads and the Alikai Canal project. It is proposed to employ the Rangoi Cut workers on tanks, which will keep them occupied till 1st July. But these tanks will not provide for everyone, and the residents of the Tohána Sub-tahsil, who have hitherto eked out a living on the Southern Punjab Railway works, will have to be provided for.

Work has started on the Hissar cattle farm ditch and the Western Jumna Canal cuts-off. Tank work is in full progress in Hissar and the north of Hánsi. The Hánsi-Tushám and Bhiwáni-Tushám roads will soon have to be stopped and tanks are being started in these two tahsils. Hánsi is provided for till the rains; Bhiwáni is not, as tank work there, owing to the sandy soil, is not so well fitted for famine relief as in other parts of the district; and there are no works which can be carried on in that tahsil, but the desirability of undertaking the fencing of the Rewári-Ferozepore Railway is being considered.

The provision of a sufficiency of suitable relief works for this district is constantly under the consideration of Government. Application has been made to the Government of India for permission to carry out the earthwork on the Tohána-Ludhiána Railway, and estimates have been called for of the cost of railing labourers to other parts of the Province where large works are available.

The wages paid on relief works are sufficient. Prices have risen since the last monthly report, and no relief in this respect is expected until the *rabí* harvest is reaped in the Punjab.

Gratuitous relief is being issued in Sirsa, Fatahabad, and Bhiwáni. It has been begun in three relief circles in Hissar and in two in Hánsi, and in the course of the first fortnight in March this form of help will be general all over the district.

Poor-houses have been opened in Sirsa, Fatahabad, Hissar, and Bhiwáni towns. Except in Sirsa the attendance is meagre, and at present the inmates are chiefly immigrants from Native States.

Two deaths from starvation have been reported from Sirsa. Both were immigrants, and reports regarding them have been submitted.

The case of death from starvation reported in last month's report has since been discovered to have been really a case of suicide.

Large amounts of grain are still being distributed in private charity. The most systematic and therefore the most effective efforts in this direction are being made by the ladies belonging to the Baptist Zenána Mission Society in Bhiwáni, by Rám Sarúp, Mahájan, of Satraud, and by a Mahájan of Dhíranwás, Tahsíl Hissar.

Rohtak District.

Poor-houses have not been established, but gratuitous relief is given to destitute persons. Private relief is given in the shape of grain in a few of the towns and villages by bankers and persons of substance.

The relief works that have been started are small, consisting chiefly of the excavation of village tanks, but they afford sufficient labour for those affected by famine. The physical condition of the people has been good, no deaths from hunger have been reported, but a few of the labourers who came from the Foreign State of Dujána appeared emaciated and famine-stricken.

The stock reserves of the district are roughly estimated at 498,000 maunds and include food-grains of every description. These stocks are sufficient for present requirements.

Grain continues to be imported from Delhi, Gurgaon, and Bhiwáni in the Hissar district.

The unirrigated area sown is about 1,900 acres and will yield nothing unless rain falls, when the crop will not be more than a 2-anna one.

The area under canal irrigation is estimated at 127,690 acres. The yield of the early crop is likely to be a 16-anna one, and that of the late crop an 8-anna one. The area under well irrigation is small in three tahsils, but in Jhajjar, where there is no canal irrigation, it is larger, being roughly estimated at 27,132 acres. The crop is likely to be a 12-anna one only unless rain falls. In the Bhur Circle and in the tracts affected by saline efflorescence the crops will not be more than a 2-anna one.

The relief works available, chiefly roads and tanks, are at present estimated to provide for all that may require relief.

No change was made during the month in the rates of wages. The wages were calculated on the price of gram at 10 seers per rupee.

Gurgaon District.

No rain has fallen in any part of the district during the past month.

The estimated area under crops of all description as compared with the actuals of last *rabí* in Gurgaon and Rewári is as follows:—

District.	Irrigated.	Unirrigated.
	Per cent.	Per cent.
Gurgaon - - - - -	100	45
Rewari - - - - - - - - -	55	49

In Rewári Tahsil and part of Gurgaon, where the kamín classes are in distress, the standing crops are withering in many parts from high west winds and want of rain. The prospects of the standing rain land crops are growing more and more unfavourable. The irrigated crops are as yet promising well.

Private subscriptions to the amount of Rs. 263 were raised in Sohna, and arrangements for gratuitous distribution of grain have been completed both in Rewári and Sohna. Rupees 128-7-8 has been spent during the month in supporting 15 men, 57 women, and two children in the town of Farukhnagar. A balance of only Rs. 279 remains for disposal for further relief there. Endeavours are being made to raise further subscriptions, but people are very indifferent to this call.

Food stocks throughout the district are sufficient. The import and export of food grain by rail is as follows:—

Week ending	Exports.		Imports.	
	Mds.	Srs.	Mds.	Srs.
6th February 1897 - - - -	4,812	30	3,720	0
13th „ - - -	3,892	0	1,742	0
20th „ - - - -	5,041	0	5,905	0
27th „ - - -	4,072	0	10,581	0

Wages for relief works were paid during the month in kind instead of in cash as being more convenient for the people. Instructions have, however, been issued to substitute cash for grain payments.

General health of the district and the physical condition of labourers is good. One person was reported to have died of starvation, but this was incorrect. The true cause of death was continued fever. No poor-houses have been opened in this district, but relief is afforded to some blind and infirm persons.

Delhi District.

Private relief through the relief committee has been extended during the month, but less relief is being given by private persons. There are three poor-houses where only persons totally unfit to work are given food. Relief works are roads and tanks, but the earthwork on the Delhi Agra Chord Railway is in reserve. Condition of people is fair; there are no signs of actual starvation. Food stocks are very low and considerable imports are coming in. The general condition is unchanged, but prospects are worse as the hot weather is drying up the crops. The wages have been raised as prices have risen. The death-rate in the city continues low.

Karnal District.

The receipts and expenditure from the Famine Subscription Fund are as follows:—

	Rs.	A.	P.
Receipts up to end of February 1897 - -	6,824	10	0
Expenditure do. do. - -	729	3	3
Balance - - - -	6,095	6	9

Of this amount Rs. 1,000 has been advanced to the members of the local committee of the Karnál town for distribution of gratuitous relief in that town. Gratuitous relief (from provincial funds) has also been started in villages throughout the district.

No poor-houses have yet been started. There were two large works in progress in this district during the month under report, viz., raising and improving of the Karnál-Asand road and the construction of the Kaithal Branch of the Western Jumna Canal. The former was completed on the 3rd March 1897. Another large work, the Nardak Rájbaha, has now been started from 1st March; it crosses the same tract of country as the Asand road, and it has already attracted a large number of persons from the neighbouring villages. The present two large works (viz., the construction of the Kaithal Branch and the Nardak Rájbaha) are estimated to afford relief to about 8,400 persons daily for six months.

The health of the people is good throughout the district.

Food stocks can still be freely obtained in large villages and in the centres of distress. Twenty-two thousand and seventeen maunds of grain was imported into the district during the month consisting chiefly of maize and gram.

There were some slight showers in the Kaithal Tahsil during the month, but they were not sufficient to improve matters or affect the state of famine in any way.

Hitherto the wages paid to the labourers were calculated on the price of whole grain, but they are now calculated on the price of gram flour.

The number of deaths reported to have occurred during the month is 953, which is far below the normal rate.

Umballa District.

Private Relief.—A local committee has been formed which has affiliated itself to the Provincial Committee of the Indian Famine Charitable Relief Fund. This committee will endeavour to raise local subscriptions and will administer any funds allotted to it from Lahore.

Village and Poor-house Relief.—Nil.

Character of Relief Works.—Village tanks and one canal work, which is being executed under Public Works Department supervision.

Physical Condition of People.—Labourers on works are generally speaking in good condition. Emaciation is not noticeable amongst the people.

Local food stocks are practically exhausted, but the zamíndárs still retain some stores of this *kharíf* maize. Old and rotten grain is occasionally brought out of old grain-pits. Some of this is passed, but the very bad is stopped from sale by executive intervention.

Importation of Grain goes on freely, as the weekly returns from all railway stations in the district show.

The condition and prospects of the affected area are tolerable. There will be general *rabí* harvesting operations in three weeks or so, and this will give employment to the menial classes, which are the only really distressed ones in the district.

Change in Rates of Wages.—The labourers have now been properly classified as A., B., C., and D. workers. The corresponding changes in the rates of wages have been introduced.

The death-rate in the district cannot be said to have been affected by the famine.

Ferozepore District.

Money has been subscribed largely in the Moga, Fázilka, and Zíra Tahsils for the relief of the poor in villages and the construction of works of general utility.

There are no poor-houses.

The relief works now in progress are the digging of two large tanks in tracts where they are much needed and small works in municipalities. They are sufficient to relieve the distressed population of the district, as the Agawah Canal, which is being extended, has provided work for a large number of people.

The physical condition of the people is good. Stock of food-grain sufficient. Very little grain is imported into the district, but the exports are large. The figures for the week ending 27th February are: imports 11,218 and exports 20,199 maunds. On the whole the prospects are by no means gloomy. Wages are calculated on grain selling at 10 to 13 seers per rupee.

Lahore District.

Private Relief.—A sum of Rs. 10,000 has been allotted by the Indian Famine Charitable Relief Fund for the Lahore District.

Changes in Rates of Wages.—Though the price of food-grains has risen again, no change has been made in the rates of wages.

For the rest the remarks made in last month's report still hold good.

Gujrat District.

Jhelum Canal Works.

Gratuitous relief is given to a daily average of 1,046 persons under Section 140A. Village or poor-house relief has not been found necessary.

The only relief work is the Jhelum Canal. Physical condition of people good. Food stocks ample.

Owing to the winter rains the crop prospects are fair and prices are easier.

Wages for week ending 27th February were reduced 3 pies and paid on a basis of maize flour at 9 seers.

Death-rate is not abnormal. The numbers on the works are decreasing rapidly.

BURMA.

No. 416.—1 S.-2, dated Rangoon, the 13th February 1897.

From C. G. BAYNE, Esq., Revenue Secretary to the Chief Commissioner of Burma, to the SECRETARY TO THE GOVERNMENT OF INDIA, Department of Revenue and Agriculture.

I am directed to submit a copy of letter No. 410—1 S.-10, dated the 10th February, from the Financial Commissioner containing the famine report for Burma for January.

No. 410—1 S.-10, dated the 10th February 1897.

From the Secretary to the Financial Commissioner, Burma, to the Revenue Secretary to the Chief Commissioner, Burma.

In continuation of this office letter No. 174—1 S.-14, dated the 8th January 1897, I am directed to send herewith returns in forms Appendices VI. and VII., Burma Famine Code, for Upper Burma for the period of five weeks ending Saturday evening, the 30th January 1897.

The affected areas in Meiktila and Yamethin are the same as reported last month.

During the month the provisions of the Famine Code have been extended to the whole of the Kyaukpadaung township, Myingyan district, and an additional Circle Inspector on Rs. 100 per mensem has been appointed.

The figures in columns 4 and 5 of Appendix VI. for Myingyan represent the area and population of the whole of the Myingyan, Taungtha, Pagan, and Kyaukpadaung townships, to all of which the Famine Code has been applied.

Column 15 of Appendix VI. has been kept blank, pending further information from the Deputy Commissioners concerned, as the figures given by them were obviously wrong.

The numbers on relief works show a slight increase, and the Deputy Commissioners of Myingyan and Meiktila anticipate that still further increases will take place. During the past month such crops of jowar, maize, and paddy as were obtained have been used for food by those who were fortunate enough to obtain them, but these stocks must now be becoming exhausted. The earthwork on the Meiktila-Myingyan Railway continued to be the only relief work open during the month. But sanction has now been given to the collection and breaking of ballast for the railway being treated as a relief work, and the more robust of the famine workers will shortly be employed on this.

The price of rice on which wages are calculated has remained unchanged in Meiktila, while it has declined slightly in Myingyan.

Below, points of interest in connexion with each district are noticed :—

Meiktila.—Inspectors continued to distribute gratuitous relief in villages during the month, but local officers have now been appointed, and relief will in future be distributed through them. Rice in large quantities has been imported from Lower Burma. The physical condition of the people is still reported to be fairly good, and no deaths from starvation have been reported * * * *

The Deputy Commissioner is of opinion that the price of the commoner kind of rice, which is at present rather below the average price taken for the calculation of wages, will rise again shortly.

Yamethin.—Rs. 200 were received by the Deputy Commissioner from the Rangoon Famine Relief Fund Committee. Rs. 20 were given to each local Inspector with instructions to supplement from it the Government dole in deserving cases.

No relief work is open in the district. Rice is being imported in sufficient quantities. The health of the people remaining in the district is reported to be normal.

Myingyan.—The necessity of private charity has been impressed upon those who are able to afford it, and the Deputy Commissioner reports that many destitute persons who do not, however, come within the provisions of section 57, Famine Code, are being privately relieved.

The Deputy Commissioner has kept under his own control the sum of Rs. 200 received from the Rangoon Famine Relief Committee, and is using it for the relief of the very poor who do not, strictly speaking, come under the Famine Code. Gratuitous relief in villages was given by the Myoôks of Pagan and Myingyan, and the Circle Inspector, Taungtha, and arrangements have been made for its distribution in the Kyaukpadaung township from 1st February 1897.

The health of the relief workers and of the general population of the affected tracts remains good. A few cases of small-pox have occurred in four villages in the Taungtha township.

The Deputy Commissioner says that no deaths have occurred from starvation, and that no increase has taken place in the normal death-rate of the affected tracts.

* * * * * * *

The small stocks of jowar and paddy obtained this year are being consumed locally. The situation in the affected tracts is becoming more acute owing to these local food stocks becoming exhausted and to the closing of the cotton ginning factories (which employed a considerable number of people) from lack of raw material.

The price of rice on the Myingyan section of the relief work was $3\frac{1}{2}$ annas per pyi at the beginning of the month and $\frac{3}{4}$ annas at the end; on the Taungtha section the price remained at 4 annas per pyi during the month. Hitherto the price of rice on which wages were based has been the price of old rice; in future they will be based on the price of new rice.

Monthly Famine Statement A. for the Five Weeks ending Saturday Evening, the 30th January 1897.

‡ Revised figures.

No. 369—1 S.-2, dated Rangoon, the 13th March 1897.

From C. G. BAYNE, Esq., Revenue Secretary to the Chief Commissioner, Burma, to the SECRETARY TO THE GOVERNMENT OF INDIA, Department of Revenue and Agriculture.

With reference to your Circular No. 13 F.—84–2, dated the 10th February 1897, I am directed to submit the Burma death-rate return for February called for therein. The Chief Commissioner fears that the figures are of little value. As was explained in my telegram No. 70, dated the 5th March, death statistics are not recorded in rural tracts in Upper Burma in ordinary times, and village headmen, the only agency available, cannot be trusted to record them accurately.

Special Death-rate Return, for the Month of February 1897, for Districts in which Distress exists or the existence of Distress is apprehended.

District.	Death-rate of the Month per Mille per Annum.	Average Death-rate of the Month in previous Years.	Deaths from Starvation.	Remarks.
Meiktila - - -	12	—	Nil	Statistics of deaths have only lately been collected, and the reporting is not accurate. The census figures of the population have been taken as correct, but one quarter at least of the total population is believed to have left the district temporarily. There have been a few deaths from small-pox, especially among children. The death-rate is not, the Deputy Commissioner considers, more than normal, or, if so, slightly so.
Yamethin - -	11·76	Not known	Nil	The number of deaths recorded in the month of February is 50 in the affected tract, and the population is estimated at 51,000. The death-rate would appear to be very low, but it is based on the reports of Circle Inspectors who were instructed to carefully and correctly collect statistics on this point.
Myingyan - -	10·56	—	Nil	——

No. 370—1 S.-2, dated Rangoon, the 13th March 1887.

From C. G. BAYNE, Esq., Revenue Secretary to the Chief Commissioner of Burma, to the SECRETARY TO THE GOVERNMENT OF INDIA, Department of Revenue and Agriculture.

I am directed to submit letter No. 409—1S.-10, dated the 11th March 1897, from the Financial Commissioner, containing the famine report for Burma for February.

No. 409—1 S.-10, dated Rangoon, the 11th March 1897.

From J. W. THOMPSON, Esq., Secretary to the Financial Commissioner, Burma, to the REVENUE SECRETARY TO THE CHIEF COMMISSIONER OF BURMA.

In continuation of my letter No. 410—1 S.-10, dated the 10th February 1897, I am directed to send herewith returns in forms Appendices VI. and VII., Burma Famine Code, for Upper Burma, for the period of four weeks ending Saturday evening, the 27th February 1897.

The affected areas are confined to the Meiktila, Yamethin, and Myingyan districts, and are the same as reported in the previous month.

2. The estimate of the population in the affected tract in Yamethin district has been reduced from 96,025 to 51,000 persons in consequence of the large emigration which has taken place since the commencement of the period of scarcity. The revised figures are based on the returns given in the thathameda assessment rolls.

3. The number of persons employed on relief works show a considerable decrease as compared with the figures for the previous month.

A number of toddy-palm tree climbers have left the works temporarily as they are able to obtain employment for the present in tree-climbing; coolies who are not absolutely destitute and who are disgusted with the monotony, are said to have thrown up work for the time being, and the fear of small-pox appears to have driven away some of the children. The greater number of the persons who have left the works are likely to return in a short time. The number of persons on gratuitous relief has increased largely in Myingyan district on account of the improved arrangements for distribution.

4. The figures shown in column 15 of Appendix VI. are probably somewhat below the actual death-rate for the month. Considerable difficulties are met with in obtaining an accurate return of deaths, as a system of registration has not yet been introduced generally into Upper Burma, and is not therefore readily grasped by local officers.

5. The local food supplies have been largely supplemented during the month by importation of rice from Lower Burma, the total imports from Lower to Upper Burma during the month of January having amounted to 10,671 tons of paddy and rice, and importations for February, though not accurately known as yet, will exceed this figure.

6. The Meiktila-Myingyan Railway was the only relief work open during the month. Employment was given on earthwork and on quarrying stone and collecting and breaking of ballast.

The price of rice has fallen slightly in Meiktila district, and has risen in Yamethin.

7. I am to add the following further detailed remarks on each district separately:—

Meiktila.—Gratuitous relief has been distributed during the month through local officers. With the exception of a few scattered cases of small-pox the health and physical condition of the people continues fairly good. No deaths have been reported as due directly to starvation. Rice has been largely imported, and food supplies are ample. Water and fodder for cattle are becoming scarce, but are sufficient for present needs. The price of rice has varied very slightly during the month; on the relief work common rice can be bought at the rate of 10 seers 15 chittacks for one rupee.

Yamethin.—There is no relief work in this district. The number of persons on gratuitous relief has risen slightly. A local famine relief committee has been formed, and has distributed some 40 bags of rice and 400 viss of ngapi given by residents of Rangoon. The condition of the people remaining in the affected tracts is satisfactory.

Myingyan.—Gratuitous relief was distributed during the month throughout the whole of the affected tracts. Local food supplies are practically exhausted, and rice is being largely imported from Lower Burma. The general health, both on the relief works and throughout the district, is said to be satisfactory, and no deaths from starvation are reported. The price of rice has remained almost stationary during the month, and no change has been made in the rate of wages on the relief works. Water is becoming scarce in the Taungtha township, and cattle are being emigrated from the Pagan sub-division owing to the insufficiency of water and fodder.

MADRAS.

From M. R. Ry. R. V. SRINIVASIAR, Avargal, B.A., Rao Bahadur, Secretary to the Commissioner of Revenue Settlement and Director of the Department of Land Records and Agriculture, Madras, to the SECRETARY TO THE GOVERNMENT OF INDIA, Revenue and Agricultural Department, Calcutta.

Sir, Madras, February 10, 1897.

I am directed to submit herewith the Board's monthly report on the affected area in this Presidency, prepared in accordance with section 48 (VI.) of the Madras Famine Code (*see* p. 174). Two copies of the map prepared as directed in Rule VII. are also enclosed.

I have, &c.
R. V. SRINIVASIAR, Secretary.

Remarks.—The area to be considered affected during January showed a small increase, with a corresponding increase in the population affected. The area more particularly affected is shown on the map, and the whole lies within the four Deccan districts. During the month there has been no improvement in the outlook, and the fate of the late-sown crops has now become hopeless in the affected area. The labouring classes still find some employment in gathering cotton, and removing the straw of the withering crops, as well as on the cultivation of land that is protected by irrigation from wells and, in parts of Kurnool and Cuddapah, of that under the Kurnool-Cuddapah Canal. The prospect for the cattle continues to grow worse. Pasturage in the most affected parts is practically non-existent and fodder very scarce and dear. The people have resorted largely to the forest reserves for cutting grass, which has been allowed free, and numbers of cattle have been driven off to the jungles and to Mysore for grazing.

Prices have again begun to rise, and, unless there be great relief in the pressure to the north, must be expected to continue to rise until the next south-west monsoon sets in. The districts to the south are not likely to be able to spare much surplus, for though there will be a fair late crop, it is not likely to be a large one, having been sown very late, and the early sown crops suffered severely from drought and yielded poorly. The prices given in Statement A. are those which were reported on January 30th, and since then the rates have risen again. In the districts referred to cholum (*Sorghum vulgare*) is the staple food-grain of most of the people of the parts affected, and the normal price of that grain is thirty seers per rupee.

The markets appear to be well supplied at present, and the traders no longer hold up their stocks. Trade is, however, excessively dull both so far as transfers of grain within the Presidency, and as to exports northwards beyond its limits. Comparative figures, so far as available, are given for the affected districts in the following table for the two periods of four weeks ending January 2nd and January 30th, respectively :—

Districts.	Railway.	December 1896.		January 1897.	
		Receipts.	Despatches.	Receipts.	Despatches.
		Mds.	Mds.	Mds.	Mds.
Kurnool	Southern Maharatta Railway	2,410	5,233	*704	*1,469

	Madras Railway	13,529	15,864	5,742	11,612

* For two weeks only. † Not reported.

The people in the affected area are reported to be generally in good condition, but in parts of the Kurnool and Bellary districts, the Sanitary Commissioner has reported that the number of those who are seeking relief, whose condition is poor or bad, is considerable, and that the scale of wages prescribed in the Code is inadequate in the circumstances. Relief is being offered to the people in the form of employment on works, which are for the most part road works, and to such of their dependants as will accept it, as well as to a few other destitute persons, in the form of cooked food at kitchens. Besides this relief has been granted to large numbers of weavers at their own trade. The numbers of these weavers have, unfortunately, to be included under

Monthly Famine Statement A. for the Period ending Saturday Evening, the 30th January 1897.

column 11 of Statement A., together with the numbers relieved gratuitously. The weavers relieved on January 30th numbered in Bellary 743 and in Cuddapah 6,801. This form of relief is in no sense gratuitous, as the wages of C. class are only paid to the weavers on the production of regularly tasked manufactured articles. In addition to the 41,072 persons directly relieved by the State, a considerable number is employed by the ryots on carrying out land improvements, either by the aid of State loans or from their own resources. The amounts of the loans granted and disbursed up to January 30th, in the affected taluks of the districts concerned, are summarised below. Applications for loans of this class have been pouring in in parts of Kurnool, Bellary, and Anantapur, and special arrangements are being made and extra staff appointed to dispose of them promptly. So far the progress made has been fairly satisfactory in Anantapur only.

Districts.	Land Improvement Loans.								Number of Wells.

Bellary - -	9	1,575	5	450	156	17,920	80	8,410	1	1
Anantapur - -	482	55,367	399	40,619	204	30,725	70	9,620	241	23
Cuddapah - -	10	1,375	9	763	—	—	—	—	4	—
Total - -	512	59,882	421	43,147	372	50,245	160	19,505	282	24

NOTE.—The figures here given relate to affected areas, not to whole districts as in Statement B., column 11.

The number of persons resorting to the relief works has been increasing during the last few weeks at the rate of about 6,000 a week, and it must be accepted that the rate of increase may rapidly become greater. The greatest increase has so far taken place in Bellary, but in Anantapur and Kurnool also during the last week there has been a material rise owing chiefly to the opening of new works. In Cuddapah the numbers remain almost stationary, but it is in this district that the number of weavers relieved at their trade is largest. More works, however, appear to be required in that district.

The mortality returns for December 1896 give the following results:—

Districts.	Number of Deaths reported.			
	During December.		From October to December.	
	1896.	Average, 1894–95.	1896.	Average, 1894–95.
Kurnool - - -	1,193	1,532	3,753	4,366
Bellary - - -	1,444	1,409	4,330	4,171
Anantapur - - -	1,027	1,044	3,478	3,020
Cuddapah - - -	2,425	2,685	6,179	7,693

So far the mortality returns show little or no practical result as having followed the present high prices, but during the last two months of the period there has been an increased number of deaths reported from some of the more affected taluks.

The state of parts of the Northern Circars, to which allusion was made in paragraph 12 of the last report, underwent no change during January, but it has become apparent that relief may be required in the Bhadráchalam taluk of Gódávari, which adjoins Bustar in the Central Provinces. In Gánjam a test relief work has recently been opened which has attracted labourers, and the Collector has considered it necessary to allow of the grant of money doles to some destitute poor. Orders have, however, been issued that the latter must be relieved at kitchens as laid down in section 64 of the Code, or, in the case of caste objections to the acceptance of cooked food, by grain doles under section 83. Money doles have been prohibited.

No. 218, Madras, 11th March 1897.

From M. R. Ry. R. V. SRINIVASIAR, AVARGAL, B.A., RAO BAHADUR, SECRETARY TO THE COMMISSIONER OF REVENUE SETTLEMENT AND DIRECTOR OF THE DEPARTMENT OF LAND RECORDS AND AGRICULTURE, Madras, to the SECRETARY TO THE GOVERNMENT OF INDIA, REVENUE AND AGRICULTURAL DEPARTMENT, Calcutta.

SIR,

WITH reference to section 48 (VI.) of the Madras Famine Code, I am directed to submit herewith the Board's monthly report on the affected area in this Presidency (*see* p. 178). Two copies of the map prepared as laid down in Rule VII. are appended.

I have, &c.

(Signed) R. V. SRINIVASIAR,
Secretary.

Remarks.—Owing to the inclusion of a portion of the Ganjám district, regarding the situation of which no map has yet been received, and to the gradual development of distress in the Deccan districts, the area and population affected show a material increase since the report for January was submitted. In Ganjám distress is not as yet acute, although a number of cases of destitution have been found and relieved, whilst, owing to the abnormal lowness of wages in that district, the Famine Code rates have not served as a test of the necessity for relief. There has also been much emigration of the men to Burma and elsewhere from that district, but it is becoming clear that considerable relief operations may be shortly necessary both in that district and in Vizagapatam. In parts of these districts there were good showers during the month, which has relieved pressure as to the supplies of drinking water and also, to some extent, as to pasturage.

In the Deccan districts there has been no improvement, and now that the gathering of the scanty straw from the late-sown crops is nearly over, and cotton picking is rapidly being finished, the demand for labour is decreasing and relief on works will be required by increasing numbers. In these districts the outlook for the cattle grows worse, and in parts not only are pasture and fodder scarcely obtainable, but difficulties as to the supply of water are great.

2. Prices have been very steady during February, with a slight upward tendency, but in Ganjám since the close of the month there has been a slight fall. The prices given in Statement A. are those reported for February 27th. In Ganjám the principal staple food-grain is rice, and secondarily ragi; elsewhere cholam is the principal staple. The markets continue to be well supplied, and though trade in food-grains is dull, it appears to be reviving to some extent, the imports by the Madras Railway into the Deccan districts having shown an increase over those of January, as shown below :—

Districts.	Railway.	January 1897.		February 1897.	
		Receipts.	Despatches.	Receipts.	Despatches.
		Mds.	Mds.	Mds.	Mds.

	Madras Railway	5,742	11,612	22,807	12,878

* For two weeks only. † Not reported.

3. The Collector's reports show that, generally, the people are in good condition, although it is clear that in parts they have been very hard pressed, whilst reports from the Sanitary Commissioner go to show that a number are in low or poor condition, and also that, owing to classification under C. class and deductions for short work the workers on one of the earlier-started works have fallen into a bad state. Relief is

Grand total -	35,475	5,596	12,754	1,958	1,310	43,542	16,617	458	61,927	4,939	—	—	—		

being granted chiefly by employment on works, which are necessarily in the Deccan districts chiefly road works. But in Bellary and Cuddapah a number of weavers is being relieved by employment at their own trade, and schemes for similar relief have been approved for the other affected districts also.

Except in Ganjám, gratuitous relief has been confined to the offer of cooked food at kitchens, and the persons relieved have been for the most part the children, or infirm dependants on the relief workers. In Ganjám gratuitous relief in the form of grain doles to destitute persons has been given, but this is now being restricted as elsewhere to the offer of cooked food at kitchens except in special cases. Sanction has, however, been recently granted by Government, on a representation of the Sanitary Commissioner, to the organisation of village relief in the more affected portions of Kurnool and Bellary, and a similar organisation has been established in Ganjám. In addition to the 66,866 persons relieved by the State direct, the Collectors of the affected Deccan districts estimate that about 7,000 persons find employment on land improvements being carried out by the aid of State loans. Applications for such loans continue to pour in in Kurnool, Bellary, and Anantapur, and, as will be seen from the subjoined table, considerable progress has been made in disposing of these applications in Bellary and Anantapur:—

Districts.	Land Improvement Loans.								Number of Wells.		Estimated Number of Labourers employed.
	For Wells.				For other Purposes.						
	Accepted.		Disbursed.		Accepted.		Disbursed.		Completed.	Under Construction.	
	Number.	Amount.	Number.	Amount.	Number.	Amount.	Number.	Amount.			
		Rs.		Rs.		Rs.		Rs.			
Kurnool	50	9,368	39	4,770	39	3,760	35	2,860	—	59	190
Bellary	16	2,425	11	1,075	493	54,270	401	44,245	1	11	2,300
Anantapur	790	1,03,102	646	57,547	285	42,860	197	23,645	37	530	4,500
Cuddapah	14	2,175	13	1,263	—	—	—	—	—	6	40
Total	870	1,17,070	709	64,655	817	1,00,890	633	70,750	38	606	7,030

The mortality return for January only became available towards the end of February. An abstract thereof for the four Deccan districts is subjoined, the totals from October to January being added:—

Districts.	Number of Deaths reported.			
	During January.		From October to January.	
	1897.	Average.	1896-97.	Average.
Kurnool	1,132	1,426	4,885	5,792
Bellary	1,408	1,316	5,738	5,487
Anantapur	1,185	970	4,663	3,990
Cuddapah	2,400	2,223	8,579	9,926

There has been an increased mortality in the affected portions of Anantapur and Bellary, and the causes are under investigation, but the death-rate is everywhere low, both for the average figures and for those of the current year. Thus any ratios would be entirely misleading.

The condition of Ganjám has been alluded to above. That of Vizagapatam continues to be fair, but the Collector anticipates that relief must be granted there also at an early date. From Bhadráchalam it is reported that the Koyas decline to accept relief on works. Arrangements are being made for the opening of further test works in both Vizagapatam and Ganjám.

No. 226, dated Madras, the 13th March 1897.

From the SECRETARY TO THE COMMISSIONER OF REVENUE SETTLEMENT AND DIRECTOR OF THE DEPARTMENT OF LAND RECORDS AND AGRICULTURE, Madras, to the SECRETARY TO THE GOVERNMENT OF INDIA, DEPARTMENT OF REVENUE AND AGRICULTURE.

Under instructions conveyed in Rule VII. of the Appendix to the Government of India Circular Resolution No. 8–52, dated 21st March 1892, as modified by paragraph 2 of Mr. Ibbetson's Circular Letter No. 16–36, dated 30th July 1894, I am directed to submit herewith a statement showing the provision made for famine relief works in the four Deccan districts noted below,* in which relief is now being given.

2. The statement contains information revised up to the end of December last in accordance with the supplementary programmes submitted by the Collectors concerned.

3. The district programmes have been thoroughly overhauled by the Famine Commissioner, and adequate arrangements have been made for the maintenance, on the lists, of a sufficiency of works available for execution as famine relief works.

FAMINE STATEMENT D.

N.B.—Numbers are shown in thousands.

District.	Population.	Maximum Number of Persons for whom Relief may be required daily in the event of serious Famine.	Number of Persons provided for by Relief Works daily for Three Months.				Remarks.
			Large Works.		Small Works.		
			Sanctioned.	Not sanctioned.	For Relief of Agricultural Population in Neighbourhood of Villages.	Others.	
1.	2.	3.	4.	5.	6.	7.	
Kurnool	815	163	205	318	91	3	These programmes include generally the construction and repair of irrigation works and roads and miscellaneous works for the improvement of supply of drinking-water and village sanitation, the clearance of village sites and the like, as well as well sinking, &c., to be executed with the aid of loans, under the Land Improvement Loans Act. 2. The provision made is generally adequate and exceeds the maximum requirements in all districts. The numbers that can be provided for on sanctioned works also exceed the expected maximum in Kurnool and Bellary. More than two-thirds of the large works in Anantapur district are sanctioned. In Cuddapah, however, the proportion of the sanctioned works is very small, and this is ascribed by the Collector to the fact that the Public Works Department is behindhand in the preparation of estimates for the irrigation works. The attention of the Public Works Department will be again invited to this matter.

										53,978	23,135			
Total	48,179	8,013	42,055	6,709	34,610	81,692	36,673	23,143	58,568	2,42,031	1,03,592	20·42	18·86	18·00(rice). 22·20(nagli). 17·13(wheat).

* This figure includes non-working children, adult dependants, and nurses only. The Collector of Bijápur reports that the number of others gratuitously relieved will be subsequently reported.

J. MONTEATH,
Acting Chief Secretary to Government.

Remarks to accompany Statement E.

(*a.*) *Private Relief.*—Generally *nil* except in Bijápur; the relief given by wealthy merchants in the larger towns of Sholápur is availed of by professional beggars. The Bijápur Municipality has opened a poor-house and a relief work. The contribution given by that body towards a grain shop has been withdrawn. The Bagálkot Municipality has also opened a relief work, and distributes gratuitous dole to its poor citizens. In Muddebihal and Tálikot people have opened shops for the poor, and in Sindgi a subscription of Rs. 2,000 has been raised for a grain shop. The Municipalities of Guledgud and Ilkal also distribute gratuitous dole.

(*b.*) *Village Relief.*—In Sholápur the distribution of gratuitious relief by the dole has been extended to 279 out of 717 villages. In Sátára only five persons are on village relief. Village and poor-house relief is also granted in 111 villages in five tálukas of Poona. In Bijápur the total number of persons gratuitously relieved during the month is 129,357. Amongst these are included Walikars (village servants), and 3,630 persons relieved by the Municipalities of Ilkal, Guledgud, and Bágalkot.

(*c.*) *Poor-house Relief.*—One poor-house has been opened and maintained by the Municipality of Pandharpur in the Sholápur District, and application has been made to open such houses at nine different places in the district.

(*d.*) *General Character of Relief Works.*—The relief works consist mainly of improving roads, breaking and collecting metal, and deepening of irrigation channels.

(*e.*) *Physical Condition of the People.*—Generally good, except that there were one or two isolated cases of cholera and small-pox in Sholápur, and some cases of small-pox and fever in Khándesh. Cholera had made its appearance for a short time in Bágalkot, Bádámi and Indi Tálukás of Bijápur, but it did not spread. Necessary precautions are being taken to keep the water clean, and measures are also being adopted against the bubonic plague.

(*f.*) *Deaths* (*if any*) from starvation.—*Nil.*

(*g.*) *Food-stocks.*—Generally sufficient.

(*h.*) *Importation of Grain.*—In Sholápur grain was chiefly imported from His Highness the Nizám's territory both by rail and road, and also from Mysore and Madras. In Bijápur there was but slight importation.

(*i.*) *General Condition and Prospects of Affected Areas* in Sátára and Khándesh are fair; in Sholápur the same as in last month. But the demand for labour is generally increasing.

(*j.*) *Changes in Rates of Wages.*—The wages given are made to depend on the prices of the staple food-grains. In Sholápur the maximum and minimum rates paid were 2 annas 3 pies and 1 anna 1 pie respectively. Statements showing the rates of wages in Khándesh and Sátára are appended.

J. MONTEATH,
Acting Chief Secretary to Government.

J. MONTEATH,
Acting Chief Secretary to Government.

No. 621 Fam., dated Bombay Castle, the 23rd February 1897.

From the HONOURABLE MR. MONTEATH, I.C.S., ACTING CHIEF SECRETARY TO THE GOVERNMENT OF BOMBAY, to the SECRETARY TO THE GOVERNMENT OF INDIA, DEPARTMENT OF REVENUE AND AGRICULTURE.

In continuation of my letter No 192 Fam., dated 19th January 1897, I am directed to submit supplementary report for the four weeks ending 26th December 1896 for the Ahmednagar, Nasik, and Belgaum Districts in Forms E. and F., together with a statement in Form E. 1, and to state that the general remarks made on Statement E., submitted with my letter referred to above, apply equally to the supplementary statement.

2. I am also to forward a map of the Ahmednagar Collectorate as required by Rule VII. of the rules printed in Appendix II. of the Bombay Famine Code. The maps for the Nasik and Belgaum Collectorates will be forwarded as soon as they are received from the Collectors.

3. With reference to paragraph 2 of the letter from the Government of India, No. 358 F.—62–2, dated 26th January 1897, I am directed to state that the number of persons gratuitously relieved in the Bijapur District on the 26th December 1896 was 13,788, and to add that the report called for in paragraph 3 of the letter will be forwarded as soon as it is received.

MONTHLY SUPPLEMENTARY FAMINE STATEMENT E. for the Four Weeks ending Saturday Evening, the 26th December 1896.

J. MONTEATH,
Acting Chief Secretary to Government.

No. 869 Fam., dated Bombay Castle, the 16th March 1897.

From the HONOURABLE MR. J. MONTEATH, I.C.S., ACTING CHIEF SECRETARY TO THE GOVERNMENT OF BOMBAY, to the DEPUTY SECRETARY TO THE GOVERNMENT OF INDIA, DEPARTMENT OF REVENUE AND AGRICULTURE.

In continuation of my letter No. 776 Fam., dated 9th instant, I am directed to forward a copy of the statement submitted by the Sanitary Commissioner for the Government of Bombay, showing the death-rate for the month of January 1897 for each of the affected districts in the Central Division, and to state that the death-rates for Belgaum and Bijapur will be reported as soon as they are ascertained.

With reference to paragraph 2 of my letter referred to above, I am directed to state, for the information of the Government of India, that the special monthly death-rate returns for all the affected districts will be telegraphed as soon as received, but that it seems to his Excellency the Governor in Council improbable that those for the majority of the affected districts can be furnished before the 20th of the subsequent month at the earliest. Further orders have now been issued to the officers concerned in accordance with the circular endorsement from the Government of India, No. 17 F.—84–12, dated 13th instant.

No. 1,138 B., dated Bombay, the 15th March 1897.

STATEMENT showing the DEATH-RATE per 1,000 of POPULATION from all Causes for the Month of January 1897, compared with the mean DEATH-RATE for the same Month for the preceding Ten Years from 1887 to 1896.

* The death-rate for these districts will be sent as soon as received.

BERAR.

No. 51 of 1897, dated Hyderabad Residency, the 25th February 1897.

From A. WILLIAMS, Esq., Secretary for Berar to the Resident at Hyderabad, to the SECRETARY TO THE GOVERNMENT OF INDIA, Revenue and Agricultural Department.

Sir,

In accordance with Rule 10 of the Rules circulated with the Resolution of the Government of India, No. 5—48, dated the 2nd March 1892, and section 26 of the Bombay Famine Relief Code, which has been adopted provisionally in Berar, I am directed to submit the following report on the scarcity now prevailing in parts of the Hyderabad Assigned Districts. As explained in my letter No. 40, dated the 12th February 1897, this report was necessarily held back till the several districts reports under section 22 of the said Famine Relief Code had been considered and disposed of.

2. The following statement shows the area affected, its population, and the numbers that may be expected to require relief between the 1st March and the next monsoon in June. The numbers in column 5 are purely conjectural; it is not likely, however, that they will be exceeded. The Commissioner indeed considers that the estimate for Basim is far too high, while for Buldana the local officers have not been able to supply any trustworthy figures. Mr. Bullock, writing on 13th January, reported that the amount of distress in this district is not very marked. No serious trouble is anticipated in the districts of Amraoti or Wun or in the plain taluks of Ellichpur. In the Akola districts the taluks most seriously affected are Akola, Balapur, and Khamgaon. The classes likely to suffer are the agricultural labouring classes supplemented by immigrants from the Central Provinces :—

District.	Taluk.	Area in Square Miles.	Total Population.	Numbers likely to Require relief.
1.	2.	3.	4.	5.
Amraoti	Murtizapur	610	121,657	
Akola	Akola	738	137,988	8,000
	Balapur	569	101,673	
	Khamgaon	443	99,785	
		1,750	339,446	20,000
Basim	Basim	1,046	177,250	
	Mangrul	635	82,446	
	Pusad	1,275	138,485	
		2,956	398,181	84,000
Ellichpur	Melghat	1,649	7,031	7,000

3. The rainy season of 1896 in Berar was characterised by an average rainfall during the months of June, July, and August, and by an almost entire absence of rain during the months of September, October, and November; while in December the rainfall exceeded the average of that month. The principal crops in Berar are the *kharíf* crops of juar and cotton, which take up about 68 per cent. of the entire cultivated area of the Province. The area cultivated of juar in 1896 is not known; the area cultivated of cotton is in excess of the average of the last five years, and the outturn of both crops has been reckoned at eight annas for the whole Province. The two principal *rabí* crops are wheat and linseed, which together occupy about 20 per cent. of the whole cultivated area, and the estimated outturn for the current year has been placed at four annas. Both these crops are grown mainly for export. The stock of food-grains available in Berar from past years is estimated as being enough to maintain the entire population of the Province for about one year. It follows, therefore, from the foregoing facts that the agriculturists themselves should under the circumstances require little or no relief even if prices continue at their present high figure. With the

agricultural labouring classes, especially in the affected area, the case is different; a comparatively scanty *kharíf* harvest, and, in consequence of the failure of the north-east monsoon, short sowings of the *rabí* crops have deprived them of occupation to some extent; their credit is bad, and prices are high. From April till agricultural operations recommenced the agricultural labourer will be in difficulties. It is noticed, however, that in many parts of Berar the preparation of the land for sowing has been already commenced.

4. As to the economic condition of the affected area in ordinary times, it is probably enough to say that there is no record of any serious famine in Berar. The facilities for local trade are ample, but prices being equally high throughout the Province, little local trade is likely to take place. On the other hand, the *kharíf* harvest in the northern districts of the Hyderabad State, which border the districts of Basim and Buldana, was fair, and the import of grain from that quarter lies under no restriction save an export duty of 5 per cent. Internal communications are good; the affected taluks are traversed by serviceable roads, and the Great Indian Peninsula Railway runs through the Province from east to west with a branch to the trading centre of Khamgaon.

5. As regards arrangements proposed for famine relief administration and the possible requirement of the services of officers from other Provinces, I am to say that the Resident thinks that the district staff should be able to deal adequately with the situation as it exists at present. It may be found necessary to entertain a few additional officers to supervise relief works and to provide for medical and sanitary superintendence, and also to strengthen temporarily the staff of Naib Tahsildars; but more than this is not likely to be needed. The projects which will first be undertaken as occasion arises for the relief of the affected districts are stated in a note by the Secretary in the Public Works Department in Appendix A., and they will, it is anticipated, provide suitable labour for as many as are likely to require it between the present date and June. Their aggregate estimated cost is upwards of Rs. 3,30,234; the expenditure, however, so far actually sanctioned for the current year is Rs. 53,000 from provincial and Rs. 77,500 from local funds. The necessity of adhering strictly to the provisions of the Famine Relief Code regarding tasks and wages, especially on test works, has been particularly impressed on the officers concerned. In the Melghat, and exceptionally situated forest taluk, relief works were opened in January last. The total number employed on five works on the 10th February 1897 was 2,152. As reported in this office No. 382, dated the 19th December 1896, relief works in the Melghat are in charge of the local forest officers, who are best qualified to deal with the Gonds, Kurkus, and other aboriginal tribes of that hill tract. Small local fund projects have at the same time been sanctioned as test works outside the affected area, but it is not expected that they will attract labour for the present: one opened in the Wun district has already collapsed. Provision, too, has been made for the opening of poor-houses in the Amraoti and Akola districts by the Commissioner, and in the municipalities of Akola, Khamgaon, Akot, Shegaon, and Basim by the municipal committees concerned under the rules of the Famine Relief Code. So far none have been found actually necessary, but one supported by private charity in Amraoti is reported to be doing good. Among the artisan classes no appreciable distress has been reported up to date. On ordinary works capable of affording suitable employment the first four municipalities named above are further prepared to contribute in 1897–98 an aggregate sum of Rs. 23,600.

6. In the matter of takavi, I am to say that the allotments of Rs. 46,000 and Rs. 9,500 under the Land Improvement Act and the Agriculturists' Loans Act respectively have been almost exhausted. Under the latter Act a supplemental allotment has been sanctioned of Rs. 500; under the former the Commissioner has applied for a further grant of Rs. 53,000; but he has been asked to first report how far the purposes to which it would be devoted fulfil the conditions laid down in the circular letter of the Government of India, No. 11–F./27–1, dated the 8th February 1897. Indirectly, too, relief has been afforded by timely grant of forest concessions. As already brought to the notice of the Government of India in the correspondence ending with Mr. Sly's letter No. 1112/290–2–F., dated the 21st December 1896, the Conservator had been authorised to alter the scale of rates for forest produce fixed under Rule 10 of the Rules applicable to State-forests of Classes A. and C., and the Commissioner now reports that important concessions have been made chiefly in respect of the rates for timber, fuel, bamboos, grazing, and minor produce, and that they are much appreciated. The total loss of

forest revenue involved cannot be exactly estimated, but it is not likely to fall short of Rs. 50,000, the loss on grazing dues alone being computed at Rs. 40,000. The supply of fodder and water had been reported as inadequate everywhere, except in the districts of Basim and Ellichpur and in parts of Akola, but the condition of the agricultural stock need not now cause any serious anxiety. Suspensions of land revenue will be considered as necessity arises on the principle laid down in the Resident's Book Circular No. XXV., dated the 9th January 1897, a copy of which is annexed as Appendix B. So far no suspensions have been proposed.

7. The expenditure for 1897–98 which the Resident has sanctioned up to date amounts to Rs. 2,18,000 from provincial and Rs. 1,46,975 from local funds. The Resident has at his disposa lan estimated balance of Rs. 1,08,266 on his existing contract which expires on 31st March next, and the budget estimates for 1897–98 prepared on the basis of 50 per cent. of the revenue show a balance of Rs. 43,850, so that the total sum available for extraordinary expenditure from provincial funds in 1897–98 is only Rs. 1,52,116, or less by Rs. 65,884 than the amount at present required. The Resident anticipates, however, that in framing the contract for the five years commencing with 1st April 1897–98, the Government of India will allow him a fair sum for extraordinary expenditure, from which the afore-mentioned deficiency and any further demands which may arise out of the circumstances of the season can be met.

I have, &c.
A. WILLIAMS,
Secretary for Berar.

APPENDIX A.

NOTE by the SECRETARY to the RESIDENT in the PUBLIC WORKS DEPARTMENT.

The following large relief works will be undertaken as they may be required :—

District.	——	Cost.	Remarks.
		Rs.	
Akola - -	Road from Telhara to Ursool, 9½ miles	35,000	Estimate really not formally sanctioned.
Do. - -	Construction of tank at Erundal -	11,000	Ditto.
Do. - -	Diversion of Shanoor River - -	35,000 (probable).	Estimate not quite ready, but work could be begun.
Amraoti - -	Road from Karinja to Darwa, 22 miles	1,10,234	Estimate sanctioned. About 16 miles in Wun District.
Do. - -	Road from Nandgaon to Bisnoor -	12,000 (probable).	Projects under preparation.
Do. - -	Road from Bulgaon to Kolapur -	10,000 (probable).	
Wun - -	Road from Karinja to Darwa, about 16 miles (*see* under Amraoti).	—	
Do. - -	Road from Darwa to Digras, 16 miles	60,000 (probable).	Project ready for work, but estimate not quite ready for sanction.
Do. - -	Fair weather roads in south-east of district.	15,000 (probable).	Project under preparation.
Basim - -	Improvement of old Nagpur dâk line -	10,000 (probable).	Estimates not quite ready, but work might be begun at once.
Do. - -	Road from Mungrul to Sailoo -	12,000 (probable).	
Buldana - -	Improvement of old Nagpur dâk line -	20,000 (probable).	Ditto.

Besides the above, about one lakh could be advantageously spent in collecting a stock of broken stone metal for roads. A sum of Rs. 20,000 has been already sanctioned for expenditure under this head wherever relief may be required.

Other projects are under consideration; but there is some difficulty in finding relief work in Berar, because irrigation works are unsuitable to the country, and because the Province is already provided with metalled roads nearly up to the limit of the capability of the revenue to provide funds for road maintenance.

There are 1,041 miles of provincial roads, and the cost of annual maintenance is about 3¾ lakhs.

Much improvement in town and village water supply is, however, required, and the Public Works Department has been instructed to seek in that direction for such further relief projects as may be necessary.

It is hoped that the existing Public Works Department establishment will, with some temporary additions, be competent to deal with all the relief works which are undertaken.

20th February 1897. H. C. F.

APPENDIX B.

B.B. Cir. No. XXV., dated the 9th January 1897 (Ch. I., Vol. IV.).

(Next preceding Circular No. XXIV., dated the 30th June 1896 (Ch. I., Vol. IV.).)

District officers are reminded that the Land Revenue Code for the Hyderabad Assigned Districts came into operation on the 1st January 1897, and that arrears of land revenue are recoverable by any one or more of the processes enumerated in section 119. Attention is also called to the provisions of Chapter X. of the Famine Relief Code on the subject of the suspension and remission of land revenue. Having regard to the distress which owing to the premature cessation of the monsoon rains may be expected to prevail in some parts of the Province, district officers should institute careful inquiry into applications for suspension of revenue, should grant provisional postponements promptly in cases in which the whole crop or a considerable part of it has entirely failed, due regard being paid to the circumstances of individuals, and should abstain as far as possible from resort to coercive processes to enforce payments.

(By order)
(Signed) A. WILLIAMS,
Secretary for Berar to the Resident.

NOTE.—The last circular issued for insertion in this Code was R.B. Circular No. IX., dated the 6th January 1897, Chapter IV., Volume III.

Circular No. $\frac{11}{27-1}$ F., Calcutta, the 8th February 1897.

From T. W. HOLDERNESS, Esq., I.C.S., DEPUTY SECRETARY TO THE GOVERNMENT OF INDIA, to the SECRETARY TO THE GOVERNMENT OF MADRAS; to the SECRETARY TO THE GOVERNMENT OF BOMBAY; to the SECRETARY TO THE GOVERNMENT OF THE PUNJAB; to the CHIEF COMMISSIONER, Central Provinces; to the CHIEF COMMISSIONER, Burma; to the CHIEF COMMISSIONER, Ajmere and Merwara; to the RESIDENT AT HYDERABAD.

SIR,

I AM directed to forward, for $\frac{\text{the information of}}{\text{your information}}$, extracts from the correspondence noted below,* with regard to the grant of advances for agricultural loans in *Bengal, in connexion with the prevailing scarcity. The Government of India desire to draw attention to the following principles which they think should be observed at the present time in dealing with proposals for such loans, viz.:—*

(1.) That no money is at present available for the purposes of ordinary land improvement as distinct from the relief of distress;

(2.) That advances such as are under consideration should therefore be made only in tracts in which relief is required, and spent in wages to those for whom it would otherwise be necessary to provide relief in some other form;

---

* (1.) Extract, paragraphs 5 and 6, from a letter from Government of Bengal, No. 5183 Agri., dated 12th December 1896. (2.) Extract, paragraphs 3 to 7, from a letter to Government of Bengal, No. 8 F., dated 22nd December 1896.

(3.) That all such advances, even though partly recoverable and made under the conditions prescribed by one or other of the Loans Acts, should in the first instance be brought to account as "Famine relief" expenditure; *vide* Financial Department Resolution, No. 5300 A., dated 16th December 1896;

(4.) That only such portion of them should be recovered as roughly represents the value of the work done, the excess cost, due to the need for the relief of distress, being borne by the State.

2. These instructions are not intended to prohibit or to apply to advances for the construction of temporary wells, for the purchase of seed, or for other similar measures in tracts where they may be required in order to avert distress and to save the cultivators from the necessity of applying for Government relief.

I have, &c.
T. W. HOLDERNESS,
Deputy Secretary to the Government of India.

No. $\frac{11}{27-1}$ F.

Copy forwarded to the Foreign Department for favour of communication to the Agents to the Governor-General, Rajputana and Central India, for information and guidance.

No. $\frac{11}{27-1}$.

Copy forwarded to the Finance Department for information.

By order,
T. W. HOLDERNESS,
Deputy Secretary to the Government of India.

No. 5183 Agri., dated 12th December 1896.

EXTRACT from a LETTER from the SECRETARY TO THE GOVERNMENT OF BENGAL to the SECRETARY TO THE GOVERNMENT OF INDIA, Department of Revenue and Agriculture.

* * * * * * * *

5. The Conference which met at Muzaffarpur suggested that advances should be given by Government free of interest in the distressed areas to zamindars and others for excavation of tanks and wells and for the execution of other petty works in their own villages. The Lieutenant-Governor accepts this suggestion (paragraph 19 of the Resolution) on the understanding that care must be taken that the works for which the advances are given are really executed, and that the money advanced is not spent on purposes other than those for which it is advanced, and that the works are really required for, and suitable as relief works, especially such as those by which the supply of water for drinking and irrigation purposes will be increased. I am to explain that the works for which these advances are proposed to be given will ordinarily be tanks, village reservoirs for storage of water and irrigation channels (pynes), and that they must be approved by the officers of Government before they are undertaken. The labourers to be employed upon them will receive not more than the maximum and not less than the minimum wage, calculated according to the principles laid down in the Famine Code.

6. The Lieutenant-Governor is unable to authorise the grant of these advances free of interest without the sanction of the Government of India. These advances will ordinarily be made under the Agriculturists' Loans Act (XII. of 1884).* Rules under that Act have been framed by the Government of Bengal, with the previous sanction of the Governor-General in Council; a copy of which is enclosed for ready reference. These

* Rule 13 of the Rules under the Agriculturists' Loans Act.

rules already give power to the Local Government to sanction loans at reduced rates of interest, or without interests; but the Lieutenant-Governor now requests the sanction of the Government of India to a general relaxation of the rule regarding interest. In the famine of 1873–74 Rule 35 of the Rules then in force under the Land Improvement Act of that time (XXVI. of 1871) was relaxed under the authority given by paragraph 17 of the resolution recorded by his Excellency the Governor-General in Council on the 7th November 1873, by a notification dated the 20th November 1873, of which a copy is annexed, in so far that no interest was charged on advances of less than Rs. 500 till after the expiration of one year. The Lieutenant-Governor apprehends that the remission of interest for one year only would not be sufficient inducement to the parties to take such loans, and therefore proposes to go further and altogether to forego interest on these loans; but does not desire to relax generally the other conditions which now govern the grant of advances such as the condition of repayment by instalments in five years. The Lieutenant-Governor would, however, in order to avoid unnecessary delays, give to the Board of Revenue discretion to relax these conditions in particular cases in which it may be found desirable to do so.

* * * * * * *

No. 8 F.—45-14, dated Calcutta, the 22nd December 1896.

EXTRACT from a LETTER from DENZIL IBBETSON, Esq., C.S.I., I.C.S., Secretary to the Government of India, to the SECRETARY TO THE GOVERNMENT OF BENGAL.

* * * * * * *

3. With regard to the advances for excavation of village tanks and other similar objects which it is proposed in paragraphs 5 and 6 of your letter to make under the Agricultural Loans Act (XII. of 1884) free of interest to zamindars and others in the distressed area, on the condition that the labourers employed upon them will receive neither more than the maximum nor less than the minimum wage prescribed by the Famine Code, I am, in the first instance, to point out that they cannot apparently be legally made under the Act in question, since that Act excludes (section 4) all the purposes specified in the Land Improvements Loans Act (XIX. of 1883), under section 4 (2) (*a*) of which the proposed works would appear to fall.

4. I am further to explain that at the present juncture money cannot be spared for advances for land improvement in the ordinary way, unless it is applied to the purpose of famine relief and expended on the principles you state, on wages to people who would otherwise drift to relief works.

It is understood that this is the intention of his Honour the Lieutenant-Governor, and that he will take such measures as he deems sufficient to satisfy himself that this condition is fulfilled. The whole of the money should, in the first instance, be brought to account as famine relief expenditure, and in no other way; though with reference to the question of recovery, which will be discussed presently, the recoverable portion of it, when ascertained, may afterwards be adjusted upon the accounts as "Advances recoverable." Any such adjustment in the way of bringing the recoverable portion under a head other than of famine relief is, however, a matter of account which can be settled later on. The object of Government making the advances is, in the first place, famine relief and not land improvement, and outlay should therefore be dealt with for the present as famine relief expenditure.

5. The question of recovery is a difficult one. As just remarked, the money in question is to be spent primarily for the purpose of famine relief; and the liability of the public purse for the provision of such relief has repeatedly been affirmed by Government. The Governor-General in Council doubts whether we either could or should propose to a landowner that he should bear the whole cost of such relief on the ground that the work to be done will result in improvement or advantage to his estate; and the more so, because it is notorious that work done (as it is essential that this work should be done) under relief conditions is more costly than it would be if done at ordinary market rates. His Excellency in Council thinks that this excess cost at least must be borne by the State, and that the liability of the zamindar to recoup Government, whether wholly or according to a stipulated proportion, must be measured, not by the cost of the relief given, but by the real value of the work done.

6. In most cases it will probably be easy to settle roughly at the time of the advance the portion of the loan which the landowner may fairly be called on to repay-three-quarters, two-thirds, or one-half, according to the nature of the local conditions. The procedure necessary to secure the recovery of this portion by summary process it will be for his Honour the Lieutenant-Governor to consider. There is, first of all, the plan of giving the entire advance under the Improvements Loans Act with a proviso that, if the work is carried out on the conditions imposed, a remission will be made of one-fourth, one-third, or one-half, as the case may be. There is the alternative of giving under the Act only so much as it is decided to recover, but this method leaves little security that the work will be executed at all. And there is a third plan of giving the loan under an agreement somewhat after the pattern attached, which is enclosed for information in case Sir Alexander Mackenzie should wish to make use of a similar document in these cases. Any question as to the legal validity of any such agreements could be very readily solved by an Act on lines similar to those of Bengal Act IV. of 1875. It it entirely for his Honour to decide what procedure he will adopt. But whatever procedure may be decided upon in this respect will of course be only as between the Government and the borrower, and will not affect the manner (already explained in paragraph 4) in which Government deals with the expenditure in its own accounts and with reference to its famine relief policy.

7. Subject to the above remarks, all the proposals of your letter regarding these advances are approved. It is understood that you will make a separate communication on the subject of the amount of grant to be made for the purposes indicated.

* * * * * * *

Circular No. $\frac{16}{104—1}$ F., dated Calcutta, the 13th February 1897.

From T. W. HOLDERNESS, Esq., I.C.S., Deputy Secretary to the Government of India, to the GOVERNMENT OF MADRAS; the GOVERNMENT OF BOMBAY; the GOVERNMENT OF BENGAL; the GOVERNMENT OF NORTH-WESTERN PROVINCES AND OUDH; the GOVERNMENT OF PUNJAB; the CHIEF COMMISSIONER, Central Provinces; the CHIEF COMMISSIONER, Burma; the CHIEF COMMISSIONER, Assam; the CHIEF COMMISSIONER, Coorg; the CHIEF COMMISSIONER, Ajmere-Merwara; the RESIDENT AT HYDERABAD.

Sir,

I am directed to forward, for information and guidance, copy of a memorandum in which are succinctly stated the leading principles regulating expenditure upon public works in time of famine.

2. Paragraphs 5 to 8 of the memorandum should be regarded as supplementing the provisions contained in the Provincial Famine Codes with regard to the expansion of "ordinary" public works and the opening of "test" works when distress is imminent or its extent and acuteness have to be ascertained. It is not proposed at present that the Famine Codes should be amended with a view to bring them into formal agreement (where this is necessary) with the memorandum as to the manner in which such works should be conducted. The statement of principles contained in the memorandum leaves in this respect a large discretion to Local Governments and Administrations, and any amendment of the Codes which may be required in this and other points will be more usefully undertaken when the experience of the present year can be brought under review.

3. As paragraph 6 of the memorandum refers to the "intermediate or gang piece work" system which has been experimentally adopted in the North-Western Provinces and Oudh, the papers noted below,* which explain this system, are also forwarded for reference.

I have, &c.
T. W. HOLDERNESS,
Deputy Secretary to the Government of India.

---

* Letter from North-Western Provinces and Oudh Government, No. 417 S., dated 14th December 1896; letter from North-Western Provinces and Oudh Government, No. 500, dated 21st December 1896, and enclosure; letter to North-Western Provinces and Oudh Government, No. 255 F., dated 16th January 1897.

No. $\frac{16}{104-1}$ F.

Copy forwarded to the Foreign Department for information and favour of communication to the Agents to the Governor-General, Rajputana and Central India.

No. $\frac{16}{104-1}$ F.

Copy forwarded to the Finance and Public Works Departments for information.

By order,
T. W. HOLDERNESS,
Deputy Secretary to the Government
of India.

PRINCIPLES for regulating EXPENDITURE upon PUBLIC WORKS in time of FAMINE.

1. In districts where no distress exists it is the general rule that expenditure upon public works, even within the limits of budget provision, should be contracted with a view to setting funds and establishments at liberty for employment when they are more needed. To this rule, however, exceptions may be made :—

(1.) Where the works could not be contracted without risk of creating distress by reducing the local employment of labour ;

(2.) Where the contraction of the works would result in returning to districts where distress exists or is threatened the labourers employed on them.

2. Where distress exists it will be necessary to provide additional employment upon works. All such additional expenditure must be subjected to the relief conditions described below.

3. The essence of relief conditions is that the remuneration for work done must be so fixed as not to attract labour for which there is existing employment elsewhere. This condition must invariably be enforced. The method of enforcing it will vary with the degree of distress which prevails.

4. Where acute distress or famine prevails, so that the general population is affected, and it is necessary to provide employment not only for able-bodied labourers, but also for a large proportion of inefficient labour, task-work must be rigorously enforced, nobody being allowed either to do more than the fixed task or to earn more than the fixed maximum wage. The former condition is necessary in order to economise the supply of useful work upon which labour can be employed ; the second, in order to limit expenditure, since, when the dependants of a skilled labourer are paid separately, it is not necessary for purposes of relief to pay him more than a subsistence wage.

5. But when distress, though present, is not so acute as to drive on to the works a large proportion of inefficient labour or of persons unaccustomed to work, payment by results is more economical than task-work ; for so long as an able-bodied labourer can earn enough, under the conditions laid down in paragraph 3, to enable those of his family who do not work to live at home, he will support himself and them more cheaply than Government can do.

6. Payment by results may take the form, either of an expansion of ordinary works under the usual system of petty contracts, or of the intermediate or gang piece-work system of the North-Western Provinces. The former is sufficient when distress is slight ; but as the scarcity becomes more acute and threatens to deepen into famine, the latter should be substituted, since it secures proper remuneration to the individual workman, which, under the urgency of distress, the former fails to do.

7. If the rates offered are regulated by the principle laid down in paragraph 3, gang piece-work will effectively gauge the intensity of distress, since it will afford to inefficient labour only a bare subsistence.

8. As soon, therefore, as the demand by inefficient labour for employment on these terms begins to be appreciable, additional test-works on the task-work system may

usefully be opened, though at a sufficient distance from the piece-work works to insure that if the man works at piece-work and his women and children at task-work, they shall at least be compelled to live apart. These will provide for the women and children during the intermediate stage, while distress is becoming acute. As soon, however, as the demand by inefficient labour for employment upon either system becomes considerable, acute distress is present, and payment by results must then be discontinued and task-work substituted for it.

9. It is conceivable that in any district there may be cases in which the rapid and efficient prosecution of a particular public work is of such importance as to justify a relaxation of the above conditions. Such instances will be rare, the works will be of magnitude, and each case will be decided upon its individual merits.

10. It is for Local Governments to judge of the local conditions in each case, and to justify to themselves or to the Government of India, as the case may be, the action to be taken under the principles thus laid down.

No. 15 (Revenue and Agriculture) of 1897, dated Calcutta, the 17th March 1897.

From the GOVERNOR GENERAL OF INDIA IN COUNCIL to the RIGHT HON. LORD GEORGE F. HAMILTON, M.P., HER MAJESTY'S SECRETARY OF STATE FOR INDIA.

MY LORD,

WITH reference to your Lordship's Despatch No. 9 (Rev.), dated the 15th January 1897, we have the honour to forward a copy of the accompanying letters received from Local Governments and Administrations showing the extent to which they have been able to comply with your Lordship's request to be kept informed as to the monthly mortality in districts affected by famine or scarcity. The returns are unfortunately incomplete for January, but the information still wanting will be supplied as soon as possible. The Madras return has not yet reached us, but we have ascertained that the death-rate in no part of that Presidency is abnormal.

9. In Upper Burmah there is at present no system of death registration in rural tracts.

3. In Bombay, the Punjab, Bengal, and the Berars there has been so far no exceptional mortality.

4. In the North-Western Provinces and Oudh the death-rate for January was exceptionally high in the districts of Fatehpur, Banda, Hamirpur, Jhansi, Rai Bareli, and Hardoi; and was in excess of the normal in other districts. The Local Government reports that the rise in the mortality is due, or partly due, to the wet and cold weather which then prevailed and which told on the health of the people collected on the large relief works. We have asked the Local Government whether the high mortality was due in any district to epidemic disease, and we shall acquaint your Lordship in due course with the result of our inquiry.

5. From the Central Provinces the return for January has not yet been received. We enclose the returns for the two preceding months, and we shall report the result of the inquiries we are making.

We have, &c.

ELGIN.
G. S. WHITE.
J. WESTLAND.
J. WOODBURN.
M. D. CHALMERS.
E. H. H. COLLEN.
A. C. TREVOR.

No. 359, dated Lahore, the 22nd February 1897.

From M. W. FENTON, Esq., Revenue Secretary to the Government of the Punjab, to the SECRETARY TO THE GOVERNMENT OF INDIA, Department of Revenue and Agriculture.

I am directed to acknowledge to receipt of your Circular No. 13–84–2 F., dated the 10th February 1897, asking for a special monthly death-rate return for districts in which distress exists or is apprehended.

2. In reply I am to say that, with a view to watching any variation in the death-rate in this Province, the Lieutenant-Governor had already arranged for the submission of a weekly death-rate return for those districts in which relief operations are in progress. A copy of the return for the month of January is enclosed for information, and, if there is no objection, a return in this form will be submitted monthly for the information of the Government of India.

Statement showing Death-rates per 1,000 of Population per Annum.
For Weeks ending.

No. C. 330 (Fam.), dated Camp Bilaspur, the 9th March 1897.

From H. H. PRIEST, Esq., I.C.S., Chief Secretary to the Chief Commissioner, Central Provinces, to the SECRETARY TO THE GOVERNMENT OF INDIA, Department of Revenue and Agriculture.

In compliance with your telegram of the 3rd instant, in which you ask for the provincial statistics of mortality for the months of November and December 1896 and January 1897, in the form prescribed in Revenue and Agricultural Department Circular No. 13 F., dated the 10th February 1897, I am directed to submit the required information for the months of November and December. The January figures are still incomplete for 10 districts, but will be forwarded as soon as possible. The February returns will also be submitted at an early date.

2. With reference to the instructions contained in your Circular No. 13 F., dated the 10th February 1897, regarding the regular submission of monthly returns of the mortality in distressed districts, for the information of the Secretary of State, I am directed to enclose copy of a Circular Letter (No. 1400, dated the 4th March 1897), issued by the Chief Commissioner, to secure compliance with these instructions. The Chief Commissioner trusts that the desired information will be available for March and the following months with some approach to completeness.

STATEMENT showing the DEATH-RATE for the Month of November 1896 and 10 previous Years.

No.	Districts.	Death-rate per Mille for the Month of November 1896.	Average Death-rate per Mille for 10 previous Years.	Total Deaths from Starvation.	Remarks.

No. 776 (Fam.), dated Bombay Castle, the 9th March 1897.

From the HONOURABLE MR. J. MONTEATH, I.C.S., ACTING CHIEF SECRETARY TO THE GOVERNMENT OF BOMBAY, to the DEPUTY SECRETARY TO THE GOVERNMENT OF INDIA, DEPARTMENT OF REVENUE AND AGRICULTURE.

With reference to your telegram dated 2nd instant, requesting that the Government of India may be furnished with the monthly death-rate returns for each of the affected districts in the Central and Southern Divisions for the months of October, November, and December 1896 and January 1897, together with the average death-rate returns

for those months, I am directed to forward copy of a statement submitted by the Sanitary Commissioner for the Government of Bombay, furnishing the required information for the first three months, and to state that the figures for the month of January will be furnished as soon as they are available.

2. With reference to your Circular Letter No. 13–F.—84–2 dated 10th ultimo, I am to state that it has been represented to this Government that it will not be possible for the district officers to submit the monthly death-rate returns, so as to admit of the required figures being reported to the Government of India by the 10th of the month subsequent to that to which they relate. Further inquiries have, however, been instituted in the matter, and endeavour will be made to furnish the returns at the earliest possible date in each month.

STATEMENT showing the DEATH-RATE, per 1,000 of POPULATION, from all CAUSES, for the Months of October, November, and December 1896, compared with the MEAN DEATH-RATE for the preceding Ten Years, from 1886 to 1895, in the following COLLECTORATES.

Months.	Central Division.												Belgaum.		Bijapur.	
	Ahmednagar.		Khandesh.		Nasik.		Poona.		Satara.		Sholapur.

Telegram, dated 15th March 1897.

From BOMBAY to CALCUTTA.

From BOMBAY GOVERNMENT to REVENUE.

Your Circular No. 13 F. of 10th February. Death-rate for February, Bijapur 6 talukas, 1·81; Khandesh, 17 talukas and pethas, 1·8; Satara, 1·98; Sholapur, 1·74; exclusive of 34 villages average of month in previous years:—Bijapur 2·29, Khandesh not reported, Satara 1·64, Sholapur 1·69. Deaths from starvation in all these districts, nil. Figures for other districts will be reported when available.

No. 731, dated Allahabad, the 11th March 1897.

From the SECRETARY TO GOVERNMENT, North-Western Provinces and Oudh, to the SECRETARY TO THE GOVERNMENT OF INDIA, DEPARTMENT OF REVENUE AND AGRICULTURE.

In compliance with your telegram No. 704 F.—84–K.W., dated 2nd March 1897, I am directed by the Lieutenant-General and Chief Commissioner to furnish the accompanying statement, showing the mortality in all districts officially declared to be distressed or under observation. The January figures for a few districts have not yet been supplied.

2. It is probable that the slight rise in mortality in January, or some part of it, is due to the inclement weather which prevailed then. The extreme cold and the wet

at the end of December and in January must have pressed more severely than usual where large crowds were collected on relief works.

STATEMENT showing DEATH-RATE in DISTRICTS in which DISTRESS exists or is apprehended during October, November, and December 1896, and January 1897, with AVERAGE DEATH-RATE for the previous Years of each Month.

Districts.	October.		November.		December.		January.

RETURN of the NUMBER of PERSONS in receipt of RELIEF in DISTRICTS affected by SCARCITY.

NOTE.—The figures are compiled from the Local Gazettes, and give the district details of the provincial totals published weekly in the Crop and Weather Summary in the "Gazette of India."

Non-labouring children and other dependents of relief workers are classed as on relief works when distinguished in the local returns from persons gratuitously relieved in poor-houses or at their homes.

	Grand Total for all Provinces.	2,175,163	640,810	2,815,973	2,167,762	636,078	2,803,840	2,194,276	662,889	2,857,165	2,251,062	702,528	2,953,590

The dates at the head of the table are the dates of the "Gazette of India" in which the provincial totals were published. The figures however actually show the numbers on relief on each preceding Saturday. Thus the figures in the last column actually show the numbers on relief on Saturday the 10th April. All previous returns should be read subject to a similar correction.

T. W. HOLDERNESS,
Deputy Secretary to the Government of India.

Dated 23rd April 1897.

NUMBERS on RELIEF in SUCCESSIVE WEEKS (as reported telegraphically).

No. 81 Revenue, dated 20th May 1897.

From the RIGHT HONOURABLE THE SECRETARY OF STATE FOR INDIA IN COUNCIL to His Excellency the RIGHT HONOURABLE THE GOVERNOR GENERAL OF INDIA IN COUNCIL.

MY LORD,

SINCE my Despatch, dated the 15th January 1897, I have received from your Excellency's Government the further papers noted below* concerning the famine and relief operations, while your weekly and monthly telegrams bring the narrative of events down to the present time. Two sets of famine papers have already been presented to Parliament, and a third set is in the press.

2. The area of relief operations has considerably extended since January, and by the latest accounts relief of some kind was being given in parts of one hundred British districts, in four districts of the Nizam's territory, and in some other Native States. According to your monthly telegram of the 12th April, the main relief numbers were as follows :—

RELIEF STATISTICS, as per Telegram for Week ending the 9th April 1897.

Province.	Number of Districts in which Relief Operations of some kind are going on.	Distressed Tracts.						Affected Tracts.				Total Number in receipt of Relief of all kinds in 000s.
		Area in Square Miles.	Population in 000s.	Number on Relief Works in 000s, including Dependents.	Numbers on Gratuitous Relief in 000s.	Total Number on Relief in 000s.	Percentage of Numbers on Relief to Total Population.	Area in Square Miles.	Population in 000s.	Number on Relief Works in 000s.	Numbers on Gratuitous Relief in 000s.

* No. 4, dated 6th January, from the Secretary to the Government, with enclosures; No. 9, dated 13th January, from the Secretary to the Government, with enclosures; No. 13, dated 20th January, from the Secretary to the Government, with enclosures; No. 23, dated 27th January, from the Secretary to the Government, with enclosures; No. 27, dated 3rd February, from the Secretary to the Government, with enclosures; No. 31, dated 10th February, from the Secretary to the Government, with enclosures; No. 39, dated 17th February, from the Secretary to the Government, with enclosures; No. 9, dated 24th February, from the Government of India, with enclosures; No. 45, dated 24th February, from the Secretary to the Government, with enclosures; No. 50, dated 3rd March, from the Secretary to the Government, with enclosures; No. 11, dated 10th March, from the Government of India, with enclosures; No. 57, dated 10th March, from the Secretary to Government, with enclosures; No. 15, dated 17th March, from the Government of India, with enclosures; No. 65, dated 17th March, from the Secretary to Government, with enclosures; No. 69, dated 24th March, from the Secretary to Government, with enclosures.

The total numbers on relief had been as high as 3,216,000 during the week ending the 9th March, and they have again risen to 3,608,000 by the middle of May. Out of the earlier total, 1,654,000 were in the North-West Provinces and Oudh; afterwards the numbers on relief in those provinces fell 650,000, in consequence of the demand for labourers at the spring harvest, and in consequence of the partial improvement of the situation caused by the ingathering of the spring crops. In the Central Provinces, Bengal, Bombay, and Madras, the numbers on relief have advanced more or less steadily; and in these tracts the spring crops have not lessened the strain on the relief administration.

3. The result of the spring harvest over India is now approximately known. The rain from November to February has been unusally favourable to the spring crops. In the Punjab a good harvest has been realised or is expected over 85 per cent. of the usual wheat area; the spring grains form a much larger part of the food supply for the common people than in other provinces; the relief numbers have fallen; and any fear of famine for the greater part of the Punjab has practically passed away, though prices are still high, and some relief may continue to be needed until August next. In the North-West Provinces and Oudh a fair spring harvest has been obtained over two-thirds of the normal area devoted to that crop, with the result that prices have remained steady or have fallen, that the food supply has nowhere failed, and that the numbers receiving relief were, on the 16th April, 32 per cent. less than they were on the 5th March; though subsequent telegrams have shown that the numbers on relief had again risen to 1,316,000 by the middle of May. It appears to be uncertain how far into the autumn relief operations on a large scale may continue to be required. But it is quite clear that relief administration was begun in good time, and has been wisely and carefully conducted in those provinces. Even if relief should be required until October in the unfortunate districts of Bundelkund, there is ground for hoping that in the remainder of these provinces the people will be in good condition and good heart for returning quickly to their usual occupations, when the monsoon shall have favourably begun.

4. In Bengal the spring harvest has been satisfactory over South Behar; but the spring crops count for little in North Behar where distress has been keenest. Prices have not fallen in Bengal despite the large importations of Burma rice. There is one feature in the Bengal relief administration, which may be susceptible of explanation, and that is the large amount of gratuitous relief. According to the telegram of the 12th April, Bengal had 293,048 relief workers and 223,784 dependents and persons on gratuitous relief of different kinds. At the end of a famine, after outdoor work is stopped by rains, the numbers on gratuitous relief may be expected to increase in comparison with the relief workers. But the proportion of people relieved gratuitously, 43 per cent., in Bengal is high for the month of April; in the North-West Provinces the corresponding proportion was 41 per cent.; in the Central Provinces 27 per cent., and in Bombay 26 per cent. It is possible that the difficulty of devising and superintending a sufficient number of village works has led to the Bengal and North-West Provinces placing very large numbers on gratuitous relief thus early in the season. It is manifestly right to run no risks by causing weakly people to travel considerable distances to large relief works. But you and your officers are doubtless fully alive to the undesirability of giving gratuitous relief on an excessive scale early in the season.

5. In the Central Provinces the spring harvests appear to have been poor, and to have been reaped over a very reduced area only. Prices are very high, especially in some of the Satpura districts. And it appears that relief on a large scale will be required far into the autumn. In Bombay the numbers on relief have not advanced rapidly during the eight weeks ending on the 16th April; the spring harvests have been beneficial; and notwithstanding the aggravation caused by plague in the coast districts, the prospect is not so serious as was at one time feared. In Madras the numbers on relief have gone up recently, but the area of distress is limited, and good crops have been harvested in other parts of the presidency.

6. In regard to the results of the relief operations you were able to telegraph on the 12th April that the condition of the people in the affected tracts continued to be generally good in Madras, Bombay, Bengal and Burma, and fair in the Punjab and Berar, while in all these six provinces the death-rate continued to be normal. In the

North-West Provinces and Oudh the condition of the people is reported to be fair to good, though the death-rate is considerably above normal in the districts of Bundelkund and in some of the Oudh districts. Regarding the Central Provinces you report that in the wilder parts the poorer classes show signs of privation, some cases of emaciation still occur, and the mortality exceeds the normal rate. The latest complete statistics that have reached me are for the month of February, and in the undermentioned districts the death-rate of 1897 is 50 per cent. or more above the normal rate for the month, thus,—

DISTRICTS in which the DEATH-RATE of 1897 exceeds the normal DEATH-RATE by 50 per cent. or upwards.

Central Provinces (10 out of a total of 20 districts).			North-West Provinces and Oudh (17 out of 37 distressed and affected districts).		
Districts.	February 1897.	Average, 10 years.	Districts.	February 1897.	Average, 10 years.

			Lucknow	3·33	2·12
			Unao	3·31	1·81
			Budaon	3·19	1·86
			Shahjahanpur	3·00	1·90
			Basti	2·65	1·73
			Partabgarh	3·84	1·90
			Sultanpur	3·27	1·84

The death-rate in some parts of the Central Provinces was very high; I observe the monthly famine statement gives the "deaths due directly or indirectly to the effects of privation" in the whole of the Central Provinces as 4,885 during the month of January, while your telegram of the 16th April reports the January death-rate in six of the districts of those Provinces to have ranged between 5·3 and 6·9 per thousand, and in one sub-division, whither immigrants flock from Native States, to have reached 10·6 per thousand; but even here, in spite of exceptional difficulties, I trust that relief operations are now, and have for some time been, adequate and effective.

It is satisfactory to find that food supplies are nearly everywhere sufficient, local deficiencies being met by private imports. During the three months January to the middle of April nearly 268,000 tons of Burma rice were imported, and a large further surplus of rice (estimated at one million tons) is still available there. Your decision to trust to private trade for supplying food to the country has so far been amply justified. I approve your decision to take steps to secure supplies of food for certain parts of the Central Provinces, where transport is difficult during the rainy season.

8. The contributions to the Mansion House Fund and other public funds raised for the succour of sufferers from the present famine in India exclusive of gifts in kind appear to have reached a total of about 142 lakhs of rupees (887,000*l.*) by the middle of May; and the Central Relief Committee report that the local committees in the several provinces ask for grants aggregating 166 lakhs. Already 50 lakhs have been distributed to the provincial committees in British India and in Native States, who are devoting the money to supplying clothing and small comforts to sufferers and to giving doles to the respectable poor. Voluntary associations and workers are helping to husband these resources, to prevent abuses, and to make the money do as much good as possible. Arrangements are being made to distribute the remaining funds at the proper season so as to enable the poorer cultivators to buy seed-corn and cattle, and thus to recover their position. The splendid liberality shown by the United Kingdom, Canada, and other British Colonies, and also by many charitable people in foreign

ountries, will be greatly appreciated in India; and I am confident that these funds, hich have been contributed by all classes, will be administered as a sacred trust by ll committees and individuals engaged in their distribution.

9. It was not to be expected that India could pass through a severe and far-reaching m ne without much suffering to her and some loss of life; but I am satisfied that, he whole, your Excellency's Government, and the many local authorities and local es engaged in the contest with famine, have been unquestionably successful, and I glad to assure you that the arduous and self-sacrificing labours of those on whom duty has fallen are fully appreciated in this country.

I have, &c.

G. HAMILTON.

Reports from Bombay from 26th April to 1st June 1897 180

Report from Berar, dated 1st April to 26th May 188

Resolution of the Government of India, No. $\frac{20\text{–F}}{157\text{–I}}$ dated 12th May 1897 208

Famine Letters, No. 28, of 28th April, and No. 33, of 18th May 1897, from Viceroy to Secretary of State 209

Weekly statement showing numbers on relief during week ending 17th July 1897 ... 219

Table showing numbers on relief in successive weeks from 31st October 1896 to 30th July 222

Tables showing the Death-rates in all Famine Districts from November 1896 to May 1897, inclusive 223

TELEGRAMS.

From Viceroy, 21*st May* 1897.

Famine. Showers throughout Bengal, where agricultural prospects good. Autumn crops sowings being actively prosecuted. In Burma fair rain has fallen; elsewhere there has been but little rain since the first. Meteorological forecast considers meteorological conditions are favourable to a normal monsoon, south-east trades being of normal strength. Numbers on relief increasing as expected. In Allahabad division 900,000 on relief; in Darbhanga and Champaran 340,000. Rice prices are rising in Bengal slightly, possibly through seed demand. Similarly autumn grains prices are rising in Punjab, while wheat and barley steady. Prices of staple grains are:—at Bellary 12 seers per rupee, Bijapur and Poona about 10, Mandla 8, Jubbulpore 10, throughout Bengal rice between 7 and 9, and in Behar maize 9½; in North-West Provinces and Oudh cold weather grains from 10 to 13; in Punjab wheat 13, barley 14. On relief:—Madras 299,000, Bombay 376,000, Bengal 782,000, North-West Provinces and Oudh 1,404,000, Punjab 89,000, Central Provinces 649,000, Burma 15,000, Berar 27,000, Hyderabad 27,000, Central India 17,700, Rajputana 23,000; total 3,869,000.

From Viceroy, 28*th May* 1897.

Famine. April death-rate in North-West Provinces and Oudh highest in Fatehpur 4·4, Banda 5·2, Allahabad 4·4, Mirzapur 4·8, Rae Bareli 5·2, Hardoi 5·2, Gonda 4·0, Sultanpur 4·6, Partabgarh 4·2. In Central Provinces, April death-rate highest in Saugor 5·6, Damoh 4·9, Jubbulpore 5·4, Mandla 4·2, Seoni 4·2, Balaghat 4·0, Raipur 4·1, Bilaspur 6·7, Narsinghpur 8·2. Cholera affected death-rate in all districts. Excluding cholera, death-rate in Saugor, Bilaspur, Narsinghpur is respectively 4·7, 5·7, 4·6. In Bombay, April death-rate highest in Satara 3·72, Sholapur 3·75, Belgaum 4·32, Bijapur 3·22; cholera prevalent in Dekkan. Bengal and Punjab death-rate normal. Madras not received.

From Viceroy, 28*th May*, 1897.

Famine. Good rain has fallen in Burma, Eastern Bengal, and Madras east coast; showers also in Bombay, and hot weather storms in North-West Provinces and Punjab. Reports show no change in the situation. Outturn of wheat crop in North-West Provinces has been distinctly good, and western districts are now exporting. Prices are generally stationary, slightly tending to rise in parts; in Madras, Hyderabad and Berar great millet ranges from 11 to 13 seers per rupee, in Bombay from 9 to 11; rice in Bengal from 7 to 9; maize and barley in Behar from 9 to 12; in North-West Provinces wheat, barley and peas from 9¾ to 13; in Punjab wheat averages 12, barley 13; in Central Provinces, at Balaghat rice and wheat are 7½, at Saugor wheat 8½, at Raipur wheat 9½, at Jubbulpore wheat 10. On relief:—Madras 355,000, Bombay 363,000, Bengal 821,000, North-West Provinces 1,454,000, Punjab 92,000, Central Provinces 687,000, Burma 17,000, Berar 32,000, Hyderabad 28,000, Central India 191,000, Rajputana 23,000; total 4,064,000.

14135—875—7/97 Wt 6821 D & S 6

From Viceroy, 4th June 1897.

Famine. Good rain has fallen during past week in Bengal and Burma, and early rain* crops are doing well. Weather showery in Madras and Bombay Deccan, and in parts of North-West Provinces and Oudh and Punjab, enabling fields to be prepared for sowing. Monsoon not yet established in Ceylon or India, and arrival on western coast may be delayed till the middle of June. Meteorological final forecast issued. Conditions in India and in Indian seas alike considered favourable for normal monsoon. Prices unaltered since last week, and generally situation unaltered. On relief:—Madras 401,000, Bombay 350,000, Bengal 833,000, North-West Provinces and Oudh 1,545,000, including 60,000 relieved by Charitable Relief Fund, Punjab 96,000, Central Provinces 697,000, Burma 18,000, Berar 30,000, Hyderabad 40,000, Central India 128,000 (incomplete), Rajputana 21,000; total 4,161,000.

From Viceroy, 14th June 1897.

Famine monthly telegram. Relief figures for each province as follows:—Madras has in seven districts 142 relief works, with 335,713 workers and 15,528 dependents; also 23,755 weavers employed in weaving, and 70,909 on gratuitous relief; also eleven test works in four districts, with 3,256 workers; affected and distressed area 17,800 square miles, population 3,569,000. Bombay in nine districts has 128 small and large works, with 253,338 workers and 65,957 dependants, seven poor-houses with 593 inmates, on gratuitous relief 36,177; distressed area 42,700 square miles, population 6,744,000: also six test works, with 959 workers, 145 dependants; affected area 200 square miles, population 360,000. Bengal has 588 works, with 380,348 workers and 34,435 dependants, 69 poor-houses with 8,409 inmates, on gratuitous relief 386,619; distressed area 19,800 square miles, population 9,718,000: also 57 test works, with 8,293 workers and dependants and 14,016 on gratuitous relief; affected area 5,200 square miles, population 1,902,000. North-West Provinces and Oudh have in 18 districts 924 works, with 948,719 workers and 180,682 dependants, 82 poor-houses with 29,257 inmates, besides 317,144 on gratuitous relief; distressed area 35,400 square miles, population 15,712,000: also in 19 districts 104 test works, with 24,360 workers, and 41 poor-houses with 5,529 inmates, besides 58,676 on gratuitous relief; affected area 17,600 square miles, population 9,781,000. Punjab has in seven districts 237 works, with 69,280 workers and 14,630 dependants, 12 poor-houses with 1,338 inmates, besides 14,065 on gratuitous relief; distressed area 14,300 square miles, population 3,602,000. Central Provinces have in 18 districts 212 works with 487,370 workers and 87,327 dependants, 44 poor-houses with 25,660 inmates, besides 93,048 on gratuitous relief; distressed area 50,400 square miles, population 6,167,000. Burma has in two districts two works with 12,296 workers and 2,506 dependants, besides 1,295 on gratuitous relief; distressed area 4,900 square miles, population 527,000: also in one district one test work since closed, with 58 workers; affected area 200 square miles, population 16,000. Berar has 57 works with 27,497 workers and 6,953 dependants, besides 24 poor-houses with 255 inmates, besides 5,114 on gratuitous relief; distressed area 16,700 square miles, population 2,622,000. Including Native States, numbers on relief are 4,240,337 against 3,481,480 last month. The numbers demanding relief have continued to increase most rapidly in West Madras, Bengal, Central Provinces, and Central India, crops being off ground and agricultural operations temporarily suspended till rains. Relief is at once more necessary and more eagerly sought. Task and wage conditions have been in places made stricter for able-bodied labourers, or numbers might have been greater; in Bombay decrease in numbers due in part to this and partly to cholera. Gratuitous relief extended greatly in Madras, Bengal, Central Provinces, preventing wandering and great privations, though needing very close supervision and large establishment. Monsoon, after advancing feebly on Ceylon

---

* *Sic*, query "grain."

and in Southern India, has made no progress, nor is immediate change probable. Delay is unfortunate, as owing to the great heat everywhere prevailing, and outbreak of cholera and small-pox, deficiency of fodder, pasture and water, relief operations are very arduous, telling alike on staff and on relief labourers. Condition of cattle deplorable in Dekkhan and South Punjab, and bad in parts of Central Provinces. Prices have risen slightly in month in Bengal, Central Provinces and in Southern India. Prices stationary in North-West Provinces and Oudh, but in parts of Punjab prices are slightly easier. Punjab is exporting to other provinces. Following are prices of staple grains:—Bellary 11½ seers per rupee, Poona 9⅓, Mandla 7½ seers per rupee, Saugor 8, Saran 11; barley, Dharbanga, 9; Indian corn, Shahabad, 8; rice, Delhi, 10½ seers per rupee. Wheat markets well supplied generally, but Government has had to import in Mandla and assist traders elsewhere with advances. Last month about eighty thousand tons Burma rice imported. Condition of people is fair in Madras except in parts of Ganjam; satisfactory in Bombay except in some hill tracts; good in Bengal, Burma, Punjab; good or fair in North-West Provinces and Oudh and Central Provinces; in latter province signs of distress, except in poor-houses are now infrequent. In all provinces classes on relief are mostly labourers and petty cultivators, but in worst districts higher classes and castes are noticed to be gathering to Relief Works. In all provinces Famine Fund is being actively distributed for purchase of seed and cattle, and with good general rainfall will restore many thousands to prosperity. Regarding Native States, Rajputana has had spring harvest, fair to good, and with prices easier, general situation improved. Affected and distressed area 4,300 square miles, population 1,668,000. In Central India spring harvest in parts very good. General situation improved in South Bundelkhund, but in North distress is increasing. No very material changes to report in Baghelkhand or Gwalior. Affected and distressed area 2,700 square miles, population 3,994,000. In Hyderabad distress not severe and will disappear with favourable rain.

From Viceroy, 16*th June* 1897.

Famine. Monsoon prospects have improved greatly during last two days. Continuous and heavy rain on west coast from Karwar southwards, extending inwards to Bijapur; very strong monsoon winds blowing, extending northwards. Monsoon winds also established in Bay of Bengal, giving moderate rain over south Bengal. Will keep you informed by telegraph.

From Viceroy, 18*th June* 1897.

Famine. South-west monsoon continues to give heavy rain in Mysore, Coorg, and west coast. Moderate to light rain has fallen in Bombay and Madras (Central) and Central Provinces, but deficient still. Also deficient in Berars, Rajputana, Central India. Cyclonic storm from Bay of Bengal has given good rain in Burma, Bengal (Deltaic and Central), Chota Nagpur, Behar, and northern districts North-West Provinces and Oudh. Local falls reported in South Punjab, in Bengal and Burma. Prospects good elsewhere. Preparations for sowing continue. No material change in prices. On relief:—Madras 465,000, Bombay 328,000, Bengal 831,000, North-West Provinces and Oudh 1,500,000 including 60,000 relieved by Fund, Punjab 105,000, Central Provinces 647,000, Burma 14,000, Berar 25,000, Hyderabad 28,000, Central India 205,000, Rajputana 25,000; total 4,174,000.

From Viceroy, 26*th June* 1897.

Famine. Ordinary monsoon conditions now prevail. There has been general rain throughout Burma, Deltaic and Central Bengal, and Behar, North-West Provinces; and heavy rain in Central Provinces. In Madras and Bombay Deccan

more rain is wanted in parts. In South Punjab only slight rain has fallen. In Bengal agricultural conditions quite satisfactory, and elsewhere cultivation now proceeding generally. Advance in prices in many places :—In Kurnool 11 seers, Bijapur 9½, Nasik 8¼, Saran, barley, Darbhanga, Indian corn, 9, rice 7½ ; North-West Provinces 9 to 12 ; Delhi, wheat, 10 ; Rohtak, barley, 12½ ; Bilaspur 9, Mandla 7¼, Balaghat 7. On relief :—Madras 504,000, Bombay 301,000, Bengal 842,000, North-West Provinces 1,367,000 (including 63,000 relieved by Fund), Punjab 98,000, Central Provinces 583,000, Burma 7,000, Berar 23,000, Hyderabad 17,000, Central India 160,000, Rajputana 25,000 ; total 3,929,000.

From Viceroy, 2nd July 1897.

Famine. Rainfall general and heavy in Bengal. General but irregular in North-West Provinces and Oudh. Little or no rain has fallen in other affected tracts during last few days. Rain mainly confined to Bengal, Assam, and Lower Burma, and hot westerly wind has reappeared in North-Western India. Large decrease in numbers on works due to agricultural operations for autumn harvest. Prices show a tendency to rise still further :—Bellary 11 seers per rupee, Bijapur, 8⅞, Sholapur 8⅕, Jubbulpore 8½, Raipur 8, Balaghat 7, Dharbangah Indian corn 9, Champaran Burma rice 8⅞, North-West Provinces and Oudh 9⅝ to 12, Delhi wheat 10. On relief :—Madras 559,000, Bombay 312,000, Bengal 740,000, North-West Provinces and Oudh 865,000, Punjab 93,000, Central Provinces 458,000, Burma 20,000, Berar 27,000, Hyderabad 18,000, Central India 162,000, Rajputana 24,000 ; total 3,279,000.

From Viceroy, 5th July 1897.

Famine. May death-rate highest in following North-West Provinces and Oudh districts :—Fatehpur 4·03, Rai Bareli 4·01, Hardoi 3·51. Highest in following Central Provinces districts :—Saugor 7·48, or excluding cholera 5·80, Damoh 6·31 or 5·29, Jubbulpore 6·31 or 5·29, Narsingpur 7·41 or 5·31, Hoshangabad 7·76 or 5·16, Mandla 7·17 or 5·11, Balaghat 6·56 or 5·55, Raipur 7·50 or 4·14, Bilaspur 6·79 or 5·03. Cholera prevalent in Central Provinces, and probably more of the deaths reported are due to it than are so recorded. Highest in following Bombay districts :—Satara 7·12, Sholapur 4·12, Belgaum 5·23, Bijapur 6·87. These high rates due chiefly to deaths from cholera. Punjab, Madras, and Bengal death-rates not abnormal.

From Viceroy, 11th July 1897.

Famine. Monthly telegram. Relief figures for each province as follows : Madras has in six districts 144 relief works, with 432,886 workers, and 18,224 dependants, also 32,171 weavers employed in weaving, and 136,714 on gratuitous relief. No report one district. Also one test work in one district with 110 workers. Affected and distressed area 21,600 square miles ; population 4,726,000. Bombay in nine districts has 88 small and large works, with 213,494 workers, and 56,906 dependants, 13 poor-houses with 1,278 inmates ; on gratuitous relief 45,565 ; distressed area 42,700 square miles, population 6,744,000. Bengal has 653 works, with 260,682 workers and 30,721 dependants, 55 poor-houses, with 10,016 inmates ; on gratuitous relief 403,961 ; distressed area 23,900 square miles, population 10,195,000. Also 11 test works, with 2,862 workers and dependants, and 38 on gratuitous relief ; affected area 700 square miles, population 572,000. North-West Provinces and Oudh have in 17 districts 375 works, with 340,593 workers and 62,336 dependants, 75 poor-houses with 32,299 inmates, besides 357,097 on gratuitous relief ; distressed area 33,900 square miles, population 15,013,000 : also in 19 districts 32 test works, with 12,166 workers, and 42 poor-houses with 7,463 inmates, besides 49,877 on

gratuitous relief; affected area 19,100 square miles, population 10,484,000. Punjab has in six districts 284 works, with 75,918 workers and 8,712 dependants, 12 poor-houses with 1,478 inmates, besides 11,404 on gratuitous relief; distressed area 13,700 square miles, population 3,447,000. Central Provinces have in 18 districts 177 works, with 269,894 workers and 43,041 dependants, 44 poor-houses with 30,931 inmates, besides 110,683 on gratuitous relief; distressed area 51,800 square miles, population 6,461,000. Burma has in two districts two works, with 18,300 workers and 3,949 dependants, besides 1,314 on gratuitous relief; distressed area 4,900 square miles, population 527,000. Berar has 31 works, with 16,393 workers and 3,076 dependants, 23 poor-houses with 3,201 inmates, besides 6,659 on gratuitous relief; affected area 12,800 square miles, population 2,156,000. Including Native States, numbers on relief are 3,303,968 against 4,240,337 last month. Up to 25th June, ordinary monsoon conditions appeared well established. Agricultural operations had generally commenced and numbers on relief were declining. West coast monsoon then died away, and, excepting scattered showers, weather throughout the country has been fine. Burma still receives good rain. Good rain is now falling again on west coast to the south of Bombay and in Mysore, and fair rain has fallen last three days throughout Central Provinces, and parts Bengal and North-West Provinces. Bombay, Deccan, and Madras still without rain. If there is renewed advance of the monsoon now, damage will not have been very great, but present situation serious in districts where sowings on large scale have been made. Elsewhere sowing operations suspended, and persons returning to relief works. Great scarcity of fodder felt in Bombay, Madras, Hyderabad, Berar, and parts of Central Provinces. Prices are rising, but not rapidly. In Madras, staple food grains are about 10 seers; Bombay between 7 and 9; Bengal 8 seers, rice and Indian corn 9; North-West Provinces 9 to 12 seers; Punjab 8 to 13; Central Provinces 7 to 9; Berar 8 to 10; Gwalior 9. Grain supplies sufficient generally for three months, except Betal, Bhandara, and other isolated tracts in Central Provinces and elsewhere. Condition of people is fair in Madras, good Bengal, also Bombay except in hilly tracts; good or fair North-West Provinces and Berar; good Punjab except in Hissar; generally fair in Central Provinces, but isolated cases of privation occur in Raipur and among immigrants from Native States. Condition of relief workers fair to good everywhere. In Central Provinces all classes are represented on relief works, as also in Hissar. Cultivators are in small proportion in Bombay. Petty cultivators are found on relief works in North-West Provinces and Bengal. General position still improving in Rajputana, and if good rain falls shortly there should be little more distress. Bhurtpore State can now be excluded from affected and distressed area, 4,200 square miles, population 1,104,000. No change of any importance Central India; affected and distressed area 2,700 square miles, population 4,070,000. Hyderabad same as before.

From Viceroy, 17th July 1897.

Famine. During past week good rain has fallen in Bengal, in most districts of Central Provinces and North-West Provinces and Oudh, and some districts of Punjab. Elsewhere in Rajputana, Sind, Gujerat, and Central India there has been general rain of varying amounts. In Bombay Deccan showers have fallen in parts, but more rain is wanted. Madras still practically rainless, also Hyderabad. Some rain in Berar, but more is wanted. Situation therefore much improved, and chief anxiety now confined to Bombay Deccan, and Hyderabad (South), and parts of Madras. Autumn harvest will be late, except in Burma and Bengal, and relief consequently protracted. No material change in prices. On relief:—Madras 720,000, Bombay 359,000, Bengal 695,000, North-West Provinces and Oudh 989,000, Punjab 86,000, Central Provinces 549,000, Burma 25,000, Berar 29,000, Hyderabad 14,000, Central India 102,000, Rajputana 24,000; total 3,592,000. The rapid rise in Madras is engaging our attention.

From Viceroy, 18th July 1897.

Famine. Lieutenant-Governor of North-West Provinces reports sufficient rain has fallen now over whole province.

From Viceroy, 23rd July 1897.

General rain in Bengal (Deltaic and Central) and Behar ; prospects good, except in north Darbhanga and Champaran, where rainfall insufficient. In North-West Provinces good rain has fallen from 15 inches downwards throughout provinces, and prospects now favourable. In Central Provinces, good rain from seven inches downward, and present prospects are favourable throughout province. In Punjab, good rain has fallen in some districts, but more rain is needed. Central India and Rajputana report good, and Berar moderate rain. In Madras (Central) showers now falling, but heavier rain is much wanted both in Madras and Bombay, also in south-west of Nizam's territory. Prices risen in Madras, Hyderabad ; falling Agra ; stationary elsewhere. On relief :— Madras 797,000, Bombay 385,000, Bengal 627,000, North-West Provinces 837,000 (including 64,000 relieved from Famine Fund), Punjab 60,000, Central Provinces 574,000, Burma 26,000, Berar 34,000, Hyderabad 13,000, Central India 93,000, Rajputana 16,000 ; total 3,462,000.

From Viceroy, 30th July 1897.

Famine. Light general rain during past week throughout Bengal and Central Provinces ; heavy rain throughout North-West Provinces ; good or fair rain has fallen throughout Burma, Punjab, Rajputana, Central India, Berar, Nizam's territory. In Madras (Central) good rain has fallen in Kurnool, and fair rain has fallen in Bellary and Cuddapah ; more rain is wanted in Anantapur ; normal elsewhere in Madras. In Bombay Deccan rain has fallen widely, but more rain is wanted in Bijapur and parts of other districts. Monsoon strengthening and prospects much improved everywhere. Prices 9 to 12 seers millet Madras, 7 to 9 millet Bombay, 6½ to 9 rice and wheat Central Provinces, 7 to 9 common rice, Bengal, 9 to 12 wheat and barley North-West Provinces, 10 to 13 wheat Punjab. On relief :—Madras 831,000, Bombay 404,000, Bengal 582,000, North-West Provinces 628,000 (including 66,000 relieved by Famine Fund), Punjab 37,000, Central Provinces, 572,000, Burma 31,000, Berar 29,000, Hyderabad, 14,000, Central India, 77,000, Rajputana 16,000 ; total 3,220,000.

From Viceroy, 2nd August 1897.

Famine. In North-West Provinces June mortality highest in Hamirpur 4·97, Jalaun 3·67, Fatehpur 3·61, Mirzapur 3·45, Jhansi 3·25. In Central Provinces June mortality greatly swollen by cholera, 21,000 deaths being so returned, and many others due to same cause. Highest mortality :—in Balaghat 11·7, or excluding cholera 6·92, Bilaspur 10·9 or 6·88, Mandla 10·5 or 6·91, Saugor 10·3 or 8·5, Raipur 9·05 or 5·73, Bhandara 7·02 or 5·2, Nimar 6·96 or 5·47, Seoni 6·86 or 4·93, Tiret 6·48 or 5·43, Damoh 6·39 or 4·53, Betul 6·3 or 4·01, Puron 6·15 or 4·43, Jubbulpore 5·71 or 5·06, Wardha 5·59 or 4·13, Nagpur 4·83 or 3·97. In Bombay, highest in Satara 5·81, Poona 5·72, Nasik 5·25, Belgaum 5, Bijapur 4·56. Excess due to cholera. In other provinces mortality not excessive.

CENTRAL PROVINCES.

No. 476-C., dated Camp Saugor, the 25th March 1897.

From M. W. Fox-Strangways, Esq., I.C.S., Officiating Chief Secretary to the Chief Commissioner, Central Provinces, to The Secretary to the Government of India, Department of Revenue and Agriculture.

In continuation of my No. C. 330 of the 9th instant, and in compliance with your No. $\frac{848}{84-22}$ F., dated the 19th idem (received yesterday), I am directed to submit a statement received from the Sanitary Commissioner, showing the mortality statistics of the Provinces for the month of January 1897. A brief explanation of abnormal mortality has been given, as desired in your letter, in the remarks column, and a column has been added showing the actual excess mortality, as compared with the normal figures entered in column 2.

2. It will be observed that the January death rate shows an increase in Jubbulpore, Narsinghpur, Seoni, Betul and Sambalpur, and a decrease elsewhere. But in this connection I am to point out that the normal figure for January is lower in every district (except in Burhanpur, where it is the same in both months) in January than in December.

3. As regards deaths from the effects of privation, either direct or indirect, the Chief Commissioner regrets that he is still unable to furnish reliable statistics, and he fears that this will also be the case as regards the February return, which he hopes to submit very shortly. The subject has, however, been discussed in the monthly returns (Famine statements A and B and the appended remarks) for January and February, which have already been submitted to the Government of India. Orders have now been issued for the collection and punctual submission of the information called for in your Circular No. $\frac{13}{84-2}$ F, of the 10th February, and in my letter above quoted it was stated that the Chief Commissioner hoped to be in a position to submit figures for March with some approach to completeness.

Statement showing the death rate for the month of January 1897 *and* 10 *previous years.*

	Districts.	Death rate per mile for the month of January 1897.	Average death rate per mile for 10 previous years.	Excess mortality (column 1 — column 2.)	Total deaths from starvation.	Remarks.
		1	2	3	4	
Jubbulpore Division.	Saugor	5·3	2·8	2·5	Information not available.	Much of the excess mortality during the month was among starving immigrants from outside the Provinces. This was especially the case in the Murwara Sub-division of the Jubbulpore District.

REVENUE DEPARTMENT.

From M. W. Fox-Strangways, Esq., I.C.S., Officiating Chief Secretary to the Chief Commissioner, Central Provinces, to the Secretary to the Government of India, Revenue and Agricultural Department, No. 1934, *dated Nagpur, the 8th April* 1897.

SIR,

In paragraph 25 of Mr. Priest's letter No. 849, dated the 12th February 1897, it was stated that the Chief Commissioner hoped shortly to be able to submit a forecast of the probable requirements of the Province in the matter of famine-relief during the coming official year. Any such estimate of requirements must obviously be based on the probable numbers of persons who will seek relief, and a preliminary attempt at such an estimate for the period between the 1st of February and the end of September was made in the letter of February referred to above.

It was on this estimate and on the figures furnished by Commissioners of Divisions that the amount of 58 lakhs of rupees (exclusive of famine loans) as representing the probable provincial expenditure on famine relief during 1897–98 was fixed and reported to the Finance Department in this office letter No. 1271, dated the 27th February 1897.

2. Since these calculations were made, the Chief Commissioner has visited Balaghat, Raipur and Bilaspur, and has found that the local officers in all three districts had considerably under-estimated the numbers who will probably need relief during the hot weather and monsoon months. Moreover the actual statistics of persons in receipt of relief during the latter half of February and the first half of March have shown that the diminution in numbers which was anticipated as likely to result from harvest labour and the opening of the forests will probably, in nearly all districts, be more than counterbalanced by the effect of the steady depletion of stocks, especially in the extensive rice tracts of Chhattisgarh, where the reaping of the rabi crops gives but slight relief to the great mass of the people. The Chief Commissioner also thinks it probable that the very fact that relief works have been opened on an extensive scale, and that large bodies of people have for some time been employed on them, will deter many persons from resorting to the forests to gather *mahua* in accordance with their usual practice at this time of the year. In the majority of cases whole families have settled on the works: they have arranged for sufficient shelter: an adequate supply of food is secured, and the regular labour is not found unduly arduous or irksome; and there is thus no sufficient motive to induce them to move off to the uncertain subsistence which the forests offer.

These considerations have made it necessary to recast, in several cases, the estimates of the numbers likely to need relief in each month of the ensuing year, which were furnished by Commissioners in reply to Mr. Priest's letter No. 5123, dated the 30th December 1896; and I am now to submit for the information of the Government of India a carefully revised statement showing the probable numbers, classified as relief workers and gratuitously relieved, for each month of the next year in all districts of the Province. The estimates have been framed on the assumption that the course of the next monsoon rains will be normal and that the outturn of the kharif crops will not be below the average. If these crops should again fail, the figures will of course need entire revision; but it does not seem advisable to provide for this contingency at present. It must, moreover, be carefully borne in mind that the figures given do not pretend to be more than approximations. So far, experience has only tended to strengthen the Chief Commissioner's previous conviction that accurate prediction in matters connected with famine is almost impossible; and all that he can urge in favour of the estimates now submitted is that they are based on previous actuals and that the fluctuations indicated from month to month are those which experienced local officers think, after careful consideration, to be most probable.

3. Considering first the grand totals for the Province for each month, it may be observed that in spite of harvesting operations, which have been in active progress during the last four weeks, numbers during this period have steadily risen from 326,000 to 379,000. This increase has been most marked in the rice country of Chhattisgarh, where stocks are rapidly running out, and in the Nerbudda Division, where there has been a large immigration of harvest labourers who, owing to the scanty rabi crops, have not found their usual employment and have been forced on to the Government works. In the Jubbulpore Division, on the other hand, there has been a decrease, while in Nagpur, owing chiefly to gradual exhaustion of stocks, numbers have gone up by 33 per cent. during the last four weeks.

So far, prices have fallen but slightly, any local fall resulting in immediate export, chiefly to the North-West Provinces, which again brings them back to their previous high level. Should the *rabi* harvest prove abundant in those Provinces and the Punjab, it is possible that a more extensive and permanent fall of prices may take place when it is reaped. The spring harvest is now nearly over in the Central Provinces, and the only further probable cause of decrease in numbers during April and May is the gathering of the *mahua* crop, which, in ordinary years, gives food to large numbers, and which in normal circumstances should at least check the increase which the growing depletion of stocks would otherwise cause. The outturn of this crop is however in most districts still somewhat uncertain; cold and cloudy weather has retarded flowering, and a full crop is in several districts not expected. Moreover, as has been pointed out above, the people have now become accustomed to relief works, and will probably be frequently unwilling to leave them, even for the easier subsistence which the forests might give them. The estimates of 458,000 for April and 525,000 for May, as against 380,000 at the time of writing, seem therefore not unreasonable. In June the advent of the monsoon will certainly induce some of the less needy, especially in the Nerbudda Division, to return to their homes, while, in the rice districts, large numbers will take to field work. In the Jubbulpore Division, however, where distress is acute, it is believed that numbers will increase in all districts except Seoni, where there are large rice areas, and where a considerable proportion of those now on the works are supposed to have a sufficient reserve stock to keep them in food from sowing time to harvest. The same is the case in Nagpur, the Division where it is certain that many of those who are now on the works have come there with the idea of supporting themselves without having to consume their little stocks which they will reserve until the rains begin, and they have to provide food for themselves while engaged in field work. In Chhattisgarh there will certainly be a large decrease in numbers in June, as all cultivators will be busy in their fields. It is indeed possible that the decrease of 22,000 which has been allowed on this account is, if anything, under the mark. The result of these various considerations is that the Provincial total for June is slightly less than the figure for May. In July, when agricultural operations are in full swing everywhere, numbers are expected to fall greatly in all districts, and the diminution of the Provincial total from 507,000 to 356,000 is not more than may reasonably be anticipated. In August the ripening of the maize and some of the early millets will cause a still further fall, and this will be accentuated in September. In October the early rice will give very general relief and will probably lower prices everywhere. The rabi sowings, which will be taken in hand during that month, will still further diminish the demand for Government relief. In November the remaining kharif crops will be reaped, and after December it is generally expected that, if these crops are normal, there will be little or no further necessity for direct famine-relief.

4. A careful comparison of the actual expenditure of the current year, which is now estimated to reach 29½ lakhs, with the number of persons relieved week by week, has shown that the method of calculation hitherto adopted, that is of taking Re. 1 as representing the cost of relieving 10 persons for one day, gives, with a very fair degree of accuracy, the total cost of famine-relief, including actual wages or doles paid, establishments, hutting, tools and plant and contingencies. Accepting this basis of calculation and multiplying the total number estimated to need relief in each month by 30, the total number of units (one person for one day) who are estimated to need relief during the next year comes

to 78,508,500 or say 78½ million, which would give an expenditure for next year of say 78½ lakhs of rupees divided as follows :—

Jubbulpore Division	...	39¾	lakhs
Nagpur ,,	...	9¼	,,
Nerbudda ,,	...	18	,,
Chhattisgarh ,,	...	11½	,,
		78½	,,

From this may be subtracted 10 lakhs of rupees which have been asked for for famine loans, works executed by the aid of which will *pro tanto* diminish the demand for direct Government relief. This leaves a sum of 68½ lakhs as the probable requirements of the Central Provinces up to end of December, after which date it is generally hoped that direct relief will not be needed. The Chief Commissioner is however inclined to think that in view of the succession of bad seasons through which the districts of the Jubbulpore Division have passed, it is not at all certain that the need for Government relief will wholly cease by the end of December. Poor-houses will probably have to be kept open even after that date, and some work will have to be provided for the surplus labourers whom the reduced agriculturists will be unable to employ. He thinks therefore that something should be provided to meet such cases in January, February and the early part of March 1898, and would add 3½ lakhs to the estimate to meet such expenditure. This will raise the Provincial estimate to 72 lakhs as against 58 lakhs estimated in February. This sum is, as already observed, exclusive of 10 lakhs which have been asked for for famine loans.

5. Mr. Lyall observes that, in accordance with the previous estimate, 68 lakhs (inclusive of famine loans) have been provided for famine-relief in the Central Provinces in the Budget for 1897-98. He does not think that it will be necessary to make any change in this provision at present, the data on which the forecast now offered is based being, as already observed, very uncertain. Should further expenditure prove to be necessary, it will have to be incurred independently of Budget provision ; and it will be time enough to add to the amount provided when experience has proved that such addition is necessary.

I have, etc.,

M. W. FOX-STRANGWAYS,

Offg. Chief Secretary.

No. 908-C., dated Pachmarhi, the 19th May 1897.

From M. W. Fox-Strangways, Esq., I.C.S., Chief Secretary to the Chief Commissioner, Central Provinces, to the Secretary to the Government of India, Department of Revenue and Agriculture.

In compliance with the request contained in your telegram No. 966, dated the 9th ultimo, and subsequent reminder No. 1196-F., dated the 5th instant, I am directed to forward herewith letter No. 386-C., dated the 16th March last, to be substituted for the letter bearing the same number and date, with a copy of the revised monthly Famine Statement A for the month of February 1897, and to express regret for the delay which was unavoidable.

To be substituted for the letter bearing the same number and date.

No. 386-C., dated Camp, the 16th March 1897.

From M. W. Fox-Strangways, Esq., I.C.S., Chief Secretary to the Chief Commissioner, Central Provinces, to the Secretary to the Government of India, Department of Revenue and Agriculture.

I am directed to submit, for the information of the Government of India, consolidated monthly Famine Statements A and B as prescribed by Section 16 IV—VII of the Central Provinces Famine Code for the month of February for all districts of the Central Provinces which are affected by scarcity.

A memorandum by the Commissioner of the Division summarizing the main facts in each of the affected districts is also forwarded for each division as well as copy of a letter from the Commissioner, Nerbudda Division, which accompanied the memorandum for his division.

Maps coloured to show the affected areas are also forwarded for each district.

2. With reference to these reports and statements, I am to observe that relief measures in the Jubbulpore and Nerbudda Divisions are, the Chief Commissioner believes, now fully organized, the arrangements made there being fully adequate to meet any probable development of distress. In these divisions it will be observed the harvest operations have caused a substantial decrease of the numbers coming on Government for relief. This decrease is, however, likely to be temporary only and much of the labour now engaged in harvesting will doubtless return to the relief works when the spring crops have been fully gathered in.

In the Nagpore Division there is, Mr. Lyall thinks, some cause for anxiety as regards the Balaghat District where distress has recently been developing very rapidly, and where the Deputy Commissioner has been in weak health and unable to control the arrangements for famine relief with the necessary energy and attention. The Chief Commissioner has, on these grounds, found it necessary to transfer this officer to a lighter charge and to replace him by an officer better fitted to stand the strain of responsibility for a heavy famine district.

The Chief Commissioner visited this district towards the end of February and the whole situation there is now under his careful consideration.

3. In the two districts of the Chhattisgarh Division which are affected by scarcity (Raipur and Bilaspur) distress is, as was to be expected in tracts so largely dependent on one crop (rice), developing very rapidly, now that the small out-turn of the autumn harvest has been consumed. The circumstances of each district have recently been very fully considered by the Chief Commissioner on the spot in consultation with the local officers and he trusts that the scheme of relief which has now been matured will prove adequate to meet any probable development of the situation there.

4. As regards details it will be observed that the number of deaths reported to be due to privation in Jubbulpore and Bilaspur was large. In the case of Jubbulpore, however, the number includes, as will be seen from the Commissioner's remarks, a large number of deaths of wanderers from Native States and from the North-Western Provinces. The Government of India are aware that the northern parts of this district have long been subject to the invasion of such famine stricken persons from outside and that the method of dealing with such immigration has been one of the chief difficulties of the situation there. According to the latest information received more energetic measures are now being taken in the Baghelkhand States for the relief of distress within their borders and the Chief Commissioner hopes that the difficulties caused by immigration will decrease.

5. In paragraph 2 of your letter No. $\frac{749}{}$ F., dated the 6th instant, a request was made that the result of the enquiry into starvation deaths in Bilaspur referred to in paragraph 6 of the memorandum by the Commissioner, Chhattisgarh Division, forwarded with my letter No. 975, dated the 17th February 1897, should be submitted to the Government of India with the reports for this month. The enquiry is, however, I am to say, not yet complete, but the Commissioner of the Division has been asked to have it completed both for that and the following month as soon as possible. As soon as it is received it will be forwarded to the Government of India. The Commissioner, Chhattisgarh Division, has also been instructed to arrange for a more precise record of starvation deaths in the Raipur district.

Monthly Famine Statement A for the four weeks ending Saturday evening the 27th February 1897.

[To be submitted to the Government of India within the first half of the next month.]

FOOT-NOTE (1).—8,101 persons employed on small works started from private funds in the Bhandara District.
15,955 persons employed on Malguzari Tank works in the Balaghat District.
20,328 employed on local works started by the Deputy Commissioner and by Malguzars with the help of famine loans in the Raipur District.

No. 638-C., dated Pachmarhi, the 15th April 1897.

From M. W. Fox-Strangways, Esq., I.C.S., Officiating Chief Secretary to the Chief Commissioner, Central Provinces, to the Secretary to the Government of India, Department of Revenue and Agriculture.

In continuation of my letter No. 476-C., dated the 25th March 1897, I am directed to submit a statement, received from the Sanitary Commissioner, showing the mortality statistics of the Central Provinces for the month of February 1897. The delay which has occurred in the submission of this statement, and which the Chief Commissioner regrets, has been partly due to the necessity for scrutinising some of the very high figures reported.

2. The Murwara registering circle (the Murwara tahsil of the Jubbulpore District) again shows by far the highest death-rate, the excess over the normal being 140, and over last month's figure 5·9. Mandla also, and the remainder of the Jubbulpore District, show large excesses over the normal figure, though in the case of Jubbulpore there has been no increase over the rate reported for January. Seoni, Balaghat, Saugor and Damoh all show high rates, though in all four the rates are below those of January. In all these latter districts, however, the distress is, it is well known, acute, and the rates are not higher than might be expected under the circumstances. As regards the first three, I am to say that in Mandla no less that 363 deaths occurred from cholera, and that if these be deducted the death-rate falls to 54 per mille. In this district, one of the most severely distressed in the Provinces, the administration of relief is, owing to the large area to be dealt with, the imperfect means of communication, the scattered population, and the shy and suspicious character of the aboriginal tribes, particularly difficult.

3. There remain the two registering circles forming the Jubbulpore District. In these also cholera has been present, but not to an extent that would appreciably affect the figures. The Chief Commissioner is not at present in a position to assign any special reason for the very high mortality in this district beyond the fact that the distress there is undoubtedly more intense than in any other part of the Provinces. But I am to submit, for the information of the Government of India, copy of my letter No. 581-C., dated the 9th April 1897, from which it will be seen that a special enquiry, as suggested in your letter No. 904—26-11-F., dated the 24th March 1897, has been ordered. I am further to say that the Murwara tahsil has recently been visited by the Commissioner and the scheme of relief operations thoroughly revised with a view to reach every part of the area, and that Mr. Lyall hopes to visit it himself before the end of the current month.

No. 581-C., dated the 9th April 1897.

From M. W. Fox-Strangways, Esq., I.C.S., Officiating Chief Secretary to the Chief Commissioner, Central Provinces, to the Commissioner, Jubbulpore Division.

With reference to paragraph 6 of Mr. Anderson's summary of the district reports accompanying the monthly Famine statements A and B for the Jubbulpore Division for February last, in which he deals with the mortality of each district in January as a whole, and the deaths specially ascribed to privation in particular, I am directed to forward an extract (paragraph 3) from a letter No. 904—26-11-F., dated the 24th March 1897, from the Government of India, in the Revenue and Agricultural Department, in which they ask that some further enquiry should be made into the high death-rate prevailing in the Jubbulpore District in January.

2. The recent instructions (conveyed in Mr. Priest's circular No. 1400, dated the 4th March, subsequently revised and supplemented on the 31st March) regarding the return of mortality in distressed districts will have supplied full information for each reporting circle for the month of March; but the Chief Commissioner thinks that the enquiry now ordered should include, not only the month of January, but also that of February as well. The enquiry should be made in communication with the Sanitary Commissioner. The returns of each circle should be examined, and the deaths for each classified by clauses as in the usual monthly statements; but in addition to the details thus given, those regarding deaths in poor-houses aud those ascribed to want of food, as set forth in paragraph 4 of circular No. 1400, should be reported.

3. It will, the Chief Commissioner hopes, be found possible to distinguish deaths of wanderers from those of the resident station house population; and in the case of deaths in poor-houses to distinguish (*a*) immigrants from Native States, (*b*) immigrants from the North-Western Provinces, and (*c*) immigrants from other Central Provinces districts from deaths of residents of the district. These details should all be ascertainable from the poor-house registers. Whether in the case of relief centres this information can be given the Chief Commissioner does not know; but if it can it should be. Any additional temporary establishment that may be needed for the purpose of abstracting and compiling this information may be entertained as you may find necessary.

4. The results of the enquiry should be laid before the Sanitary Commissioner who will favour the Chief Commissioner with any observations upon them resulting from his examination, as desired by the Goverment of India. I am to request that the matter may be taken in hand as soon as possible.

Statement showing the death-rate for the month of February and ten previous years.

From M. W. Fox-Strangeways, I.C.S., Officiating Chief Secretary to the Chief Commissioner, Central Provinces, to The Secretary to the Government of India, Revenue and Agricultural Department, dated Pachmarhi, April 1897.

I am directed to submit, for the information of the Government of India, consolidated monthly statements (for March) A and B, as prescribed by section 16—IV-VII of the Central Provinces Famine Code. Figures are given for all districts affected by scarcity, that is, for all except Wardha and Sambalpur.

Memoranda by the Commissioners of Divisions, letters from the Deputy Commissioners of Betul and Chhindwara, received subsequently to the date of the Nerbudda Division memorandum, and maps coloured to show the affected districts and the localities of relief works and poor-houses in each district, are also forwarded.

2. There has been a great increase during the month in the numbers both on works and on gratuitous relief. The rabi harvest although fairly good in most districts, and even excellent in one or two, was yet, owing to the very restricted,

area sown, so small in amount as to afford but little help in the way of employing labour. The mohwa crop, again, has been very late in maturing, and, partly for this reason, and partly for the reason given by the Commissioner of Jubbulpore in his remarks on the lucrative nature, especially to families, of relief work employment, the number of those who left our works in order to pick up a living in the forests was smaller than had been anticipated. There were during the month, in most districts, sudden reductions in the numbers due to the Holi-festival, but these were invariably followed after a very short interval by a return to the former figures.

3. Another result of the short rabi harvest was the very slight effect produced on prices by the marketing of the new crop. Large quantities of wheat were exported especially from the Jubbulpore Division, and no sooner did a tendency to a fall in price appear in any district than it was immediately corrected by export to the North-Western Provinces.

4. The condition of the affected districts has thus been very little improved during the month, and it is therefore a matter for congratulation that the mortality statistics, so far as they are yet available for March, show a decided improvement. This is especially the case in the Jubbulpore District, the blackest spot, as regards the intensity of distress, in the Provinces. The figures now reported lead the Chief Commissioner to hope that the enquiry now being made in this district will show that the very large number of deaths reported as due to privation in February may need some correction. The figures for Mandla and Balaghat, however, show a serious increase. A good deal of this is due in Mandla to cholera, which began in February and continued through the greater part of March. In Balaghat also if the cholera deaths are eliminated the death rate falls from 66 to 60 per mille per annum.

5. Statement B shows that sufficient work is now provided in every district for the numbers likely to apply for it. In this connection I am to say that the programme for nearly every district has recently been revised and enlarged, and that this revision will, it is hoped, be complete for the Provinces by the end of the current month.

6. The Chief Commissioner believes that the organization of relief is now complete in every district. Much has been done during the past month towards systematizing operations and perfecting order and discipline. The system of village to village relief has been very largely extended, and the poor-house population has, wherever possible, been reduced by drafting back to their villages persons who are suitable objects of relief under Section 34 of the Central Provinces Famine Code.

7. The district and divisional reports show that food stocks are everywhere at present sufficient, and that no anxiety about their continued sufficiency is felt in any district except Mandla and Balaghat. The Commissioner of the Jubbulpore Division has been studying the question on the spot in Mandla, and the Chief Commissioner awaits his proposals, which will probably be found equally applicable to the district of Balaghat, which is very similarly situated. As at present advised Mr. Lyall does not think that there is reason to apprehend that private trade will prove unequal to the crisis.

8. It will be observed from the divisional reports that the Indian Famine Charitable Relief Fund has started operations in all divisions, and that in some districts, notably Jubbulpore and Saugor, good progress has been made. The administration of this fund, and the provision of seed grain by means of takavi advances are the two subjects which are now mainly occupying the special attention of the district officers.

9. As regards general prospects Mr. Lyall fears that now that the slight immediate effect of the harvest has passed off no great change, either in the severity of the distress or in the numbers on relief, can be looked for till the breaking of the rains. The reports show, indeed, that a certain number of cultivators are taking advantage of the relief works who are not driven to them by distress, and many of these may be expected to leave during May, when field work will begin. With a view to ascertaining what diminution may be expected from this cause orders have lately been issued for the taking of a census of cultivators on works. This census was to have been taken on the 15th instant; the results are not yet to hand.

Monthly Famine Statement A. for the 4 weeks ending Saturday evening the 27th March 1897.

[To be submitted to the Government of India within the first half of the next month.]

District.	Area.	Population in thousands.	Affected area.	Estimated population in thousands of column 4.	Numbers on Relief Works on last day of month.					Number on gratuitous relief. Children and dependants who do not work should be shown in column 11 under "gratuitous relief": if they do any work, they should be entered under class D (column 9).

N. B.—Columns 15 and 16—Any observations that it may be necessary to make respecting the extent to which increase in mortality is due indirectly or directly to famine should be included in the "Remarks" page appended to Statement A—*vide* overleaf.

If particulars to fill columns 15 and 16 cannot conveniently be submitted for the month under report in the first half of the month following, then these columns should be left blank and a separate mortality statement referring to the month previous to that dealt with in Statement A should be submitted.

This statement will relate to the period between the last Saturday of the previous month and the last Saturday of the month under report.

(*a*) Besides these there were 11,360 persons on small private works.

(*b*) " " 14,980 " malguzari works.

(*c*) Works under Civil Agency.

M. W. FOX-STRANGWAYS, *Officiating Chief Secretary.*

Monthly Famine Statement B. for the 4 weeks ending Saturday the 27th March 1897.

[To be submitted to the Government of India within the first half of the next month.]

Summary of District Reports to accompany monthly Famine Statements A and B for March 1897 as given by Commissioners.

Jubbulpore Division.

Private relief.—The main feature of the month has been the gradual organization of local private relief as part of the scheme of the Indian Charitable Relief Fund. In Jubbulpore, a grant of Rs. 10,000 was made during the month from the Central Fund in addition to Rs. 2,592 raised locally. The District Committee held several meetings during the month, and the following scheme of relief was approved of.

(*A*) *Clothing and comforts for the aged and infirm.*—Each officer in charge on the large relief works has been given an advance of Rs. 50 for clothing and extra food for the old and weakly, and an extra morning meal of rice and gur has been provided in all poor-houses and for the infirm at relief centres. To the destitute residents of villages clothing is being given, and a milk diet is being provided for emaciated or weakly village children on the gratuitous relief lists. Advances have been given to the District Superintendent of Police and Forest Officers to enable them to relieve, in the above ways, any distress they may meet with.

(*B*) *Maintenance of orphans.*—An allowance of Rs. 2 each per mensem has been made by the District Committee for all orphans in the mission, and other philanthropic orphanages, Rs. 830 were spent in this way during the month.

(*C*) *Relief of the respectable poor.*—Rs. 1,800 were spent under this head during the month in Jubbulpore, Sehora and Murwara, and an advance of Rs. 200 was given to Lady Superintendent of the Church of England Zenana Mission, for distribution among poor *pardahnashin* women.

(*D*) *Relief of the agricultural classes.*—An estimate amounting to Rs. 3,75,000 was submitted as the probable requirements for cattle and seed and subsistence grain for destitute cultivators. Careful lists of those cultivators who will need such help are being prepared, and it is intended to distribute the money before the rains break.

The Deputy Commissioner states that the people evince great gratitude for what is being done for them with the aid of the Charitable Fund.

In Saugor, somewhat less progress has been made in the organization of this branch of relief. A Committee has, however, been formed and two meetings were held during the month. Estimates of requirements under the four main heads of relief were framed and submitted to the Central Committee, Rs. 3,10,000 being calculated to be necessary for providing destitute cultivators with cattle and seed grain. Careful lists are now being prepared of the persons to whom this relief will be given. A further sum of Rs. 1,147 was subscribed locally during the month. Rs. 8,000 were received from the Central Committee and Rs. 508 were spent.

A large number of orphans have been taken charge of by the Roman Catholic and Swedish Missions.

In Damoh and Seoni, subscriptions were collected and District Committees have been formed. Estimates of the requirements for cattle and grain Rs. 3,00,000 in Damoh, and Rs. 15,000 in Seoni, were drawn up and submitted, and lists of destitute cultivators are also being prepared by local officers. In Mandla the local Famine Funds which were previously being administered by a separate Committee have been merged in the general fund and the former Committee, with the addition of two more members, has become the District Committee of that Fund. Estimates of the requirements under the four main heads of charitable relief have been framed; funds have been allotted for the provision of clothing to the destitute on relief works, the respectable poor in towns are being fed, and arrangements are being made for the timely purchase of kodo and kutki seed, of which local stocks are scanty. Detailed lists are being prepared of cultivators to whom money for cattle and grain is to be given; the district estimate under the head being Rs. 1,87,500. The Church Mission Society employed 609 persons on light labor and fed 134 persons in their poor-houses. A small poor-house was opened by Malguzars in the Dindori Tahsil and 8 people were fed there.

From this summary it will be seen that the greatest degree of progress in the organization of charitable relief has been made in Jubbulpore and Mandla. Saugor comes next, while in Seoni and Damoh much remains to be done.

Government poor-houses.—The following is a comparative statement of the number of poor-houses in the division and of the number of inmates on the last Saturday of February and March respectively:—

District.	No. of poor-houses.		No. of inmates.		+ or —
	February.	March.	February.	March.	
Jubbulpore	5	5	2,470	2,241	—229
Saugor	5	5	3,781	3,373	—408
Damoh	4	4	1,269	1,146	—123
Mandla	2	2	404	499	+ 95
Seoni	2	2	621	558	—63
	18	18	8,545	7,817	—728

Numbers have decreased everywhere except in Mandla, the decrease being due to the fact that persons who were merely temporarily incapacitated are being

gradually sent to work, or to their homes, and also, to the more complete organization of village relief which allows of people being fed in their own homes instead of being sent to poor-houses. In Mandla, however, there are numbers of Aborigines who have no homes to go to or whose villages have been deserted except by the weakly and aged. For such persons the poor-house is the best refuge, and the Deputy Commissioner expects a still further increase in future months.

I inspected the poor-houses at Jubbulpore, Murwara and Mandla and found that great care was being taken in doing all that was possible for the health and welfare of the paupers. Orphanages are also now being organized in all Head-Quarters, poor-houses and the question of providing the orphans with suitable occupation is being carefully considered.

It may be noticed that in a census which was taken in the Saugor poor-houses it was found that 819 or nearly 25 per cent. of the total population came from Native States or other Provinces. Steps are being taken to return to their homes, those who come from Native States.

3. *Village relief.*—(*a*) Relief centres.

The following table compares the number of relief centres open at the end of February and March respectively and shows the relief afforded :—

Districts.	No. of centres.		Relieved gratuitously.		At work at centres.		Total.		+ or —
	February.	March.	February.	March.	February.	March.	February.	March.	
Jubbulpore ...	19	17	2,919	1,931	16,610	11,965	19,529	13,896	—5,633
Saugor ...	8	3	504	105	90	15	594	120	—474
Damoh ...	...	...	...	...	...	...	...	...	...
Mandla ...	17	17	653	901	3,283	3,233	3,936	4,134	+198
Seoni	8	9	340	161	1,042	681	1,382	842	—540
	52	46	4,416	3,098	21,025	15,894	25,441	18,992	—6,449

Here also, the more effective organization of village relief combined with an adequate provision of work for all who need it has led to a considerable reduction in numbers everywhere except in Mandla.

In that district the area to be dealt with is so large ; parts of it are so inaccessible, and the population is so averse to leaving their homes, that relief centres must probably remain as a permanent feature in a complete scheme of famine relief. In Saugor all centres except three had been closed before the end of the month, and the remaining three have been closed since. In Seoni numbers are greatly diminishing and it will shortly be possible to close several centres, while in Jubbulpore the more effective distribution of relief works which has now been arranged for will probably also make it possible to close some of the existing centres.

(*b*) *Relief of people in their homes.*— Village relief has now been organized with a fair degree of completeness in all districts, Seoni being the most backward. The number of people entered on the 27th March as being in receipt of this class of relief was as follows :—

Jubbulpore	17,849
Saugor	7,010
Damoh	6,000
Seoni	995
Mandla	670

Numbers have considerably increased in Jubbulpore and Saugor. In Jubbulpore it was found by Famine Circle officers in the Murwara Tahsil that people in the west and east of that Tahsil, where no large works had been provided, refused to leave their homes, and were in such a reduced state that the only possible course was to bring them on the registers of village relief. Many of them will, it is hoped, soon recover their strength and, as ample works have now been provided for these tracts it is anticipated that the numbers gratuitously relieved may again diminish. In Saugor and Damoh the increase is ascribed partly to the return of old or crippled people from harvest work, and partly to such people who were wandering about the district returning to their homes on hearing that relief would be provided for them there. The question of the punctual and effective distribution of this class of relief has had the careful consideration of Deputy Commissioners and satisfactory rules have been framed and adopted.

(4) *General character of relief works.*

(*a*) *Public Works Department relief works.*

The numbers of persons on these works at the end of February and March respectively are shown below :—

District.	Works.		Dependants.		Total.		+ or —
	February.	March.	February.	March.	February.	March.	
Jubbulpore	22,793	40,517	5,162	8,247	27,955	48,764	+20,809
Saugor	23,706	29,273	3,643	2,765	27,349	32,038	+4,689
Damoh	6,076	11,267	1,314	2,054	7,390	13,321	+5,931
Mandla	15,949	14,236	4,574	3,792	20,523	18,028	—2,495
Seoni	4,284	4,761	1,059	1,013	5,343	5,774	+431
	72,808	100,054	15,752	17,871	88,560	117,925	+29,365

In Jubbulpore the number and distribution of charges remained unchanged until the close of the month when facts brought to notice by Famine Circle Officers made it necessary to consider possible improvements in the distribution of work in the Sehora and Murwara Tahsils. A redistribution was effected which, without changing the number of the charges, will result in more useful work being done and will provide adequate relief for the distressed tracts in the west and east of the Murwara Tahsil and the south-east of Sehora. In Saugor one charge was added during the month and the present arrangements are reported to be fully adequate for the needs of the district. In Damoh, Seoni and Mandla there was no change in the number or distribution of the charges.

The organization of these works is reported to be most effective in Saugor and in the Murwara Tahsil of Jubbulpore. It is also improving steadily in Seoni. In Mandla, recent inspection leads me to think that much more frequent and rigid supervision is necessary. This has now been arranged for. The chief defect is the failure to exact sufficient tasks, and it is only by constant and repeated inspection that this defect can be remedied. The Deputy Commissioner of Jubbulpore (Mr. Robertson) has been very active in inspecting Public Works Department works and his efforts have already had a good effect.

It will be noticed that numbers have increased in all districts except Mandla, the increase in Jubbulpore, Saugor and Damoh being considerable. This is mainly due to the completion of harvesting operations and Deputy Commissioners consider that there will be no diminution until the rains. It was originally supposed that the ripening of the mohwa flower would greatly lessen the population on famine works, but, so far, this has not drawn off any considerable

numbers. It is true that the crop is, this year, very late ; but it also appears probable that, now that the people have become accustomed to the works where, especially in the case of families, the wage is more than sufficient for sustenance, they will not willingly leave them even for the attraction of an idle life in the forests. I have recently examined large numbers of people on the large works in Jubbulpore and Mandla and have found that in the majority of cases they have been steadily on the works for months, the large families earning 8, 9 and even up to 12 annas a day and in several cases managing to save something out of their daily wage. I consider therefore that we may look for a steady if gradual increase on these works until the rains break.

(*b*) *Local works under District Officers.*—The numbers employed excluding dependants at the close of February and March respectively are shown below :—

District.	February.	March.	+ or —
Jubbulpore	15,160	12,886	—2,274
Saugor	108	9,239	+9,131
Damoh	8,485	11,486	+3,001
Mandla	1,068	1,505	+ 437
Seoni	1,170	1,300	+ 130
	25,991	36,416	+10,425

In Jubbulpore nearly half the total numbers were employed on two Municipal works, the rest being at work on five tanks, two in the Murwara and three in the Sehora Tahsil. No new local works were opened during the month. In Saugor two new tanks were started, one at Jaisinagar in the Saugor Tahsil and another at Khurai the Head-Quarters of the Tahsil of that name. Numbers at Jaisinagar rapidly ran up to over 6,000, and another work in that part of the district has now been arranged for. In Damoh the number of workers remained unchanged, but a severe outbreak of cholera on the Public Works Department works in the Hatta Tahsil led to a large increase in those employed on the local works.

In Mandla there were two local works at the Tahsil Head-Quarters and four forest roads. Work on a ryotwari tank was also begun during the month and, on the 27th March, was employing 190 people.

In Seoni there are 20 local works in ryotwari villages employing small numbers and two forest roads, both in the southern half of the district.

In Jubbulpore the District Council has recently submitted a representation laying stress on the importance of starting as many *local* works as possible both on the ground of their utility being greater than that of the present large works and also because they serve to keep the cultivators in their villages. In this connection it must be remembered that the very liberal terms on which famine loans are now being offered give ample apportunity to malguzars to carry out such works but, so far, they have not proved very ready to avail themselves of this opportunity. There are, however, doubtless, other works which would not benefit particular individuals or are of too large a character to be executed by private funds. With the numerous European officers who are now in charge of famine relief operations, supervision of local works can, so far as I can judge, be made quite as effective as that of Public Works Department works and where useful works can be found in distressed tracts, we should, I think, have no hesitation in starting them. I have asked the Deputy Commissioner, Jubbulpore, to give the matter his very careful attention and to ask his Famine officers to do the same. The subject will be taken up when I return to Head-Quarters.

Famine Loans.

The amounts actually paid out as famine loans up to the end of March are shown below :—

	Rs.	A.	P.
Jubbulpore	20,087	8	0
Saugor	8,500	0	0
Damoh	9,350	0	0
Mandla	3,800	0	0
Seoni...	8,243	0	0
Total	49,980	8	0

In most parts of the division, malguzars and cultivators alike have been so reduced in circumstances by a succession of disastrous seasons that they are not prepared to take further loans of any kind. In Damoh, however, the Deputy Commissioner hopes to advance a considerable sum under this head.

(5). *Physical condition of the people.*—The Deputy Commissioner, Jubbulpore, writes as follows :—

"The people who are on the larger relief works are generally in very fair condition. The difficulty has been that these works hardly reached the people in the more remote parts of the district, especially in the west, north-east and south-east of the Murwara Tahsil, and from these parts reports have been received of the low physical condition of many of the inhabitants. The programme has now been recast, so as to place the works nearer to these people. The ripening of the mohwa crop should also now greatly improve the appearance of the people in the northern parts of the district."

The Deputy Commissioner of Saugor observes that—

"There cannot be the smallest doubt that the physical condition of the people has improved very considerably during the past three months. When poor-houses were opened in all parts of the district in December, it was only natural that most of the worst cases of emaciation should be swept up into them, and this circumstance naturally brought about a low standard of physical well-being in the poor-house population. Speaking generally, I think, that the worst results of the famine were to be seen in these institutions. But the physical condition of the inmates has been gradually improving and the contrast between now and December is marked. The Administrative Medical Officers visited the Saugor poor-house on 2nd current, and was much struck by the improvement in the physical condition of the inmates which had taken place since he last visited it on 15th January. The improvement in the condition of the workers (and also dependants) on relief works has been still more marked and much more rapid. The healthy condition of relief workers in all parts of the district is now matter of common observation. There has been a similar improvement in the condition of the general population even in the worst affected tracts. Cases of emaciation are now exceedingly rare. The extension of village relief throughout the district has doubtless been largely instrumental in bringing about this satisfactory state of things."

The Deputy Commissioner of Damoh was unable, owing to ill-health, to make any personal inspections, but he writes that the condition of the people both on works and generally is reported to have materially improved.

The Officiating Deputy Commissioner of Seoni states that the condition of those in receipt of gratuitous relief is fair while on relief works it is generally good.

The Deputy Commissioner, Mandla, writes as follows :—

"On the whole the condition of inmates of the poor-houses has considerably improved during the month under report. There is also improvement at relief centres. At the poor-houses the percentage of emaciated cases is under 20. The percentage at relief centres of such cases is generally speaking small. The health of those working on Public Works Department works is generally very fair indeed and the percentage of emaciated cases is very low. The condition of the people in distressed tracts is not bad and cases of emaciation are not frequently met with. On the whole question of the condition of the people the reports of the touring officers are very favourable."

Since taking charge of the division I have inspected in some detail several relief works in Jubbulpore and Mandla. In both districts I found the condition of the workers to be distinctly healthy and robust. Among the workers themselves

I noticed no instances of emaciation, such cases being confined to a few new arrivals who were being treated in the hospital or fed in the kitchen attached to the work.

(6). *Mortality, deaths from starvation.*

The following table gives the total number of deaths and the death-rate (per mille per annum) for the months of January and February respectively :—

District.	No. of Deaths.		Death-rate.			
			Exclusive of towns.		*Inclusive of towns.*	
	January.	February.	January.	February.	January.	February.
Jubbulpore	5,807	6,839	86·	102·	107·	114·
Saugor	3,313	2,907	55·	60·	63·	59·
Damoh	1,740	1,417	...	...	64·	52·
Mandla	1,313	2,396	..	...	46·	85·
Seoni	1,948	1,621	...	...	63·	52·

As regards the increased mortality in Jubbulpore the Deputy Commissioner remarks as follows :—

"The chief feature is the high death-rate in Murwara Tahsil. Cholera was prevalent over a considerable portion of the Tahsil and I have already alluded to the fact that the people in the remoter parts of the tehsil preferred to starve rather than leave their villages and go to Public Works Department Relief Camps. Mr. McIver, the District Superintendent of Police and Mr. Maw the Circle Relief Officer found the people in a very reduced state in some of the eastern parts of Murwara. They could not be induced to go to the works, as the latter were at a considerable distance from their homes, and to this, in some measure, part of the increased mortality must be attributed. Prompt measures were taken to bring the worst cases upon village relief, and works have now been opened at Bijeraghogarh, Barhi and near Khitoli which should materially help the distress.

Adequate measures of relief have, I think, now been adopted both in the Murwara and Sehora Tahsils. The Deputy Commissioner is at present making an extended tour in the most distressed parts of these Tahsils and is giving especial attention to the sufficiency of the relief which has been given. I fear, however, that, however much may be done, mortality in the Jubbulpore district must continue high for some time to come. Many thousands of people from the Native States of the Baghelkund Agency have been pouring into this district for some time past in search of harvest labour which was far less abundant than in ordinary years. They are now returning. Many of them having earned little or nothing. Their condition is frequently very low and they are so anxious to get back to their homes that it is difficult to induce them to go on to relief works or to poor-houses. All that is practicable will be done, but it is impossible in such circumstances, to prevent a high rate of mortality.

In Saugor the district death-rate has diminished from 63 to 59 and in Damoh the decrease has been marked the rate having fallen from 64 to 52 per mille. These results are satisfactory.

In Mandla on the other hand the total number of deaths rose from 1,313 to 2,396 : the death-rate being 85 per mille as compared with 46 in January. It is true that 523 of the excess deaths were due to cholera, but there was also a large increase in the mortality from fever and bowel complaints, part of which must almost certainly be ascribed to the results of privation, I have directed the special attention of the Deputy Commissioner to these statistics and have asked him to satisfy himself both by personal inspection and through his famine circle officers that village relief is being given to all those who need it, that sufficient work has been provided and that the Police are doing their duty in looking after starving wanderers. I am at present in the Mandla district and have made

careful inspections of three out of the four large works there. These certainly give no indication of acute distress or inadequate relief. The workers are, as I have already noted, above the normal of their class in health and robustness, and cases of emaciation are only to be found in a few cases of new arrivals. The Deputy Commissioner's special report on the subject will be awaited with interest.

The Seoni figures do not call for special remarks. The following statement gives the number of deaths (*a*) due to actual want of food (starvation), (*b*) due to the effects of privation, in *February* and *March* respectively. Deaths are put in class (*a*) where they were due to the entire want of food or to inadequate food for *some days prior to death.* They occur chiefly among wanderers in remote parts of districts. In class (*b*) are put cases where in spite of adequate and suitable food, death occurred in consequence of previous want of nourishment. Such deaths take place chiefly at poor-houses and at relief centres and in the relief kitchens which are now attached to all large works :—

District.	Due to Starvation.		Due to Effects of Privation.	
	February.	March.	February.	March
Jubbulpore	631	152	2,077	1,237
Saugor	...	...	425	255
Damoh	9	14	186	167
Mandla	8	2	166	39
Seoni	30	17	29	131

It will be seen that there has been a very marked improvement in the Jubbulpore district though the figures there are still far in excess of those in any other district. The question of the high mortality in Jubbulpore is, as I have already noticed, forming the subject of special enquiry and need not be further noticed here. Meanwhile the large decrease in starvation and privation deaths as compared with the previous month is satisfactory. The statistics from other districts require no comment.

7. *Food stocks.*—On this subject the Deputy Commissioner, Jubbulpore, remarks as follows :—

"Food-stocks seem to be sufficient for present requirements. The general opinion is that there is no dearth of grain in the country. This has come out plainly enough in the enquiries we have been making as to sufficiency or otherwise of seed grain. The excellent rabi harvest in the haveli must have replenished the stocks all over the district to some extent, if we may judge from the strings of people to be seen going along the Mirzapur road carrying their labourers' share of the produce."

In Saugor stocks are reported to be ample and no difficulty is anticipated with regard to future supplies. In Damoh supplies are sufficient and, as it is now hoped that the branch of the Indian Midland Railway will be open for goods traffic by the beginning of May, this district also gives no cause for anxiety on this score. The Deputy Commissioner, Mandla, observes that stocks are beginning to run short in the interior of the district but the excellent rabi harvest so far as it goes, will tend to replenish them. The ordinary operations of trade are, so far, keeping pace with the demand both at relief camps and in the markets in the interior of the district.

Considerable difficulty is anticipated in securing an adequate supply of food-grains during the monsoon months. The demand in many parts will not be large enough to induce competition among traders nor are local trading firms sufficiently numerous or enterprising to enter spontaneously into the risks of such a business. The subject is now under consideration and it is hoped that by a system of local contracts or bounties a sufficient supply may be secured.

The following table shows the retail prices of staple food-grains in seers per rupee at the Head-quarters of each district at the end of February and March respectively :—

District.	Wheat.		Gram.		Common Rice.	
	27th February.	27th March.	27th February.	27th March.	27th February.	27th March.
Jubbulpore	10½	11	11	11½	10	9
Saugor	8	8¼	10	9¾	7	5¾
Damoh	8	7½	10	10¼	8	8
Mandla	8	9	10	11	8½	8
Seoni	10½	11	11¼	9	*9¼	*11

* Price of juar.

It will be seen that the reaping of the rabi crops has caused a slight fall in the price of wheat in all districts except Mandla where the rabi area is unimportant. That the fall in the Jubbulpore—where the outturn has been excellent—has not been much larger, is due to extensive exports from there to Upper India where higher prices were obtainable. Gram shows, but slight fluctuations except in Seoni where it has become dearer probably owing to export. The price of rice has risen in all the four districts where it is a staple. Generally speaking, it may be said that the small areas sown in Saugor and Damoh and considerable export from Jubbulpore have prevented that fall in prices which was anticipated as a consequence of the reaping of the rabi harvest. It is possible that when the new crops from the Punjab and the North-Western Provinces come on to the market there may be a further fall, but the demand for gram is, this year, so intense and widespread that it takes a very large surplus stock to produce any perceptible effect on the general level of prices.

So long as these high prices continue they must obviously increase such distress as exists. I may mention here that Burma rice is now being sold throughout the division at a price not higher than that of the local rice. It is much whiter and freer from dirt and impurities than the local product and the people buy it readily.

8. *Import and export of food-grain.*—The exports and imports for these districts where they have been registered are as shown below :—

	Imports. Maunds.	Exports. Maunds.
Jubbulpore	56,855	85,961
Saugor	4,237	5,878
Mandla	3,000	*Nil*
Seoni	8,744	4,056

The only noteworthy figures in these statistics is the large increase—nearly 30,000 Maunds—in the exports from Jubbulpore. This was due to the excellent harvest in the haveli area of that district and to the high prices obtainable in the distressed districts of the North-Western Provinces.

9. *General condition and prospects of the affected area.*—On this subject the Deputy Commissioner of Jubbulpore observes that—

"the harvesting has given very general employment for the first part of the month but now that it is over the relief works are being largely resorted to. There is no doubt also that as this is the slack season and the agricultural population have little to do many people are coming on the works who are not really distressed. Near Sleemanabad and Teori I found

whole villages practically deserted and was informed that everybody went to the works both those who had enough to eat and those who had not. It is manifestly lucrative employment for every person in the household to receive a wage, as is done on the works, and this is being taken advantage of. The prospects of the mohwa crop continue on the whole favourable. From the south of the district reports are received that the flowers have been damaged by the cloudy weather. But in the north the people consider any damage that has been done to be slight, and the crop is expected to be little below the average."

The Deputy Commissioner of Saugor reports as follows :—

"The harvest has now been gathered but it has not been by any means abundant. The yield of the crop has been best in the Rehli Tahsil and worst in Khurai. On the whole 7 annas may be taken to represent the outturn of wheat and gram, and 6 annas that of linseed. But when it is remembered what a small proportion of the normal area was sown at all, a considerable deduction must be made even from this moderate estimate. Thus comparatively few cultivators have been able to lay up a store of grain, and the improvement effected by the harvest is small. No material improvement can now be looked for until after the rains."

The Deputy Commissioner, Damoh, reports that the outturn of the rabi crops has been poor but that as a consequence of the extensive system of relief which has now been organized the condition of the people is improving. The mohwa crop, though here as elsewhere it is unusually late, promises well and will furnish a very welcome addition to the local food-supply. In Mandla the outturn of the rabi has been excellent on the diminished area ($\frac{1}{4}$ of the normal) which was sown. The mohwa has been somewhat damaged by cloudy and unsettled weather but is already furnishing perceptible relief to the people. In Seoni the good rabi crop has perceptibly improved prospects.

It may be said generally that though the rabi harvest has lowered prices to a slight extent it has not materially diminished the necessity for Government relief. Harvest wages were less liberal than usual and far fewer labourers were employed. These have now either returned or are returning to the relief works and numbers will probably continue to increase during the current month. The gathering of the mohwa crop may attract a good many away from the works, but these will shortly return and others will come to add to their number. Relief arrangements are now, however, fully organized and district officers are well able to provide for all who may seek Government relief.

The chief problem at present is the provision and distribution of seed grain. The grants from the Mansion House Fund will be of untold value in restoring the really destitute to their former and better position, while agricultural loans on a liberal scale should provide for those who still have some credit left. The matter is being dealt with with great care by all district officers.

10. *Changes in the rate of wages.*—There has been no change in the rate of wages in any district.

11. *Railway work.*—The numbers employed on the Saugor-Katni extension of the Indian Midland Railway at the end of February and March respectively are shown below :—

	27th February.	27th March.
Jubbulpore	3,692	3,935
Saugor	8,510	7,238
Damoh	8,918	12,214
	21,120	23,387

12. *General remarks for the Division.*

(*a*) *Situation of the division in regard to famine.*—The following is a

comparison of the aggregate numbers in receipt of Government relief at the end of February and March respectively :—

Nature of relief.	27th February. Nos. relieved.	27th March. Nos. relieved.
A. WORKS.		
1. Public Works Department	72,808	100,044
2. Works under Civil Officers	47,016	52,310
A. Total Works ...	119,824	152,354
B. GRATUITOUS RELIEF.		
3. In Poor-houses	8,465	7,817
4. All other kinds of gratuitous relief including dependants on works	44,834	57,442
Total Gratuitous Relief ...	53,299	65,259
Grand Total Relieved ...	173,123	217,613

It will be seen that owing to the cessation of harvest labour there has been a considerable increase under all heads except poor-houses. The decrease in the numbers in poor-houses is due to the more complete organization of village relief. Those who recover their strength are drafted off while there are fewer new arrivals owing to those who formerly sought refuge in the poor-house, now receiving relief in their homes. The kitchens which have now been established on all the large Public Works Department works will also tend to diminish the poor-house population.

(*b*) *Measures taken to organize and complete measures of relief.*—Village relief has now been fully organized in all districts and a scheme of works suitable for the hot weather and rains has been worked out for Damoh and Saugor and is under consideration in other districts. Two more European Relief Officers (Staff Corps Officers) have been posted to Saugor and one more to Mandla. The arrangements for famine relief may now be considered to be complete in all districts all that is needed being constant aud sustained supervision.

(*c*) *Prospects of the division as regards the scarcity.*—The rabi crops having been gathered in, no marked change in the situation can be anticipated at present. Numbers will probably increase during the current month and increasing exhaustion of stocks in kharif areas must make distress more acute. The gathering of the mohwa crop will form a most useful addition to the food supplies of the people, and, especially in remote tracts, should improve the general health and tend to diminish the death-rate.

NAGPUR DIVISION.

Private relief.—No change in arrangements under this head is reported from Nagpur and Balaghat. In Bhandara, local subscriptions amount to about Rs. 1,250 per mensem up to the end of June. While Rs. 4,000 have been received as a provincial allotment from the Provincial Committee at Nagpur. In addition to money being distributed to relief works and poor-houses, the necessities of respectable persons in towns and elsewhere, are relieved, a scheme for the relief of the weaver class is being introduced, and information regarding requirements of cultivators in the matter of bullocks and seed grain is being collected. I am aware that similar action is being taken in other districts also but details are not reported.

Poor-house relief.—A proposal to close the Kampti poor-house and take action under Section 34 of the Famine Code, is being considered. No new poor-houses have been opened. In Bhandara, the number of inmates has risen from 787 to 811. A trifling increase due to more careful organization. The Deputy Commissioner reports that at all poor-houses there are a number of persons who would "more suitably be relieved at their own homes," and that he is arranging to do this. In Balaghat the number relieved was 1,634 against 1,392 in February and 1,149 in January. Total dieting charges amounted to Rs. 4,103.

Village relief.—Nothing to record as regards Nagpur. Probably some assistance will be required at Mansar near Ramtek, where the mohwa crop has all but failed. The Deputy Commissioner intends visiting this spot and will report definitely as to the extent of relief (if necessary), required. The only relief centres in the Bhandara district are children's kitchens at police station houses and outposts. The number of persons on village relief is estimated at 250. But the number is expected to increase in the future, as four Additional Revenue Inspectors, through whom relief is given, have been sanctioned for employment in this district. In Balaghat the total expenditure incurred on account of this form of relief was Rs. 7,672 the number of persons relieved being 3,058.

General character of relief works.—In the Nagpur district new works (Public Works Department) have been opened at Metpanjra and Mansar. The number of people on the latter work increased rapidly soon after it was opened. These two new camps have resulted in an increase in the number on relief works throughout the district to 4,098, compared with 1,278 in the previous month. The poor outturn of mohwa in this part of the district induced many to flock to the relief work near Mansar. Details are given in Statement D of the district statements. In Bhandara, there has been no change in the number of relief works under the Public Works Department. On the 27th March there were 10,763 persons on the Tumsar, Rampaili, Amgaon-lanji and Gondia-Arjuni roads as compared with 15,094 persons on 27th February 1897. Similarly, on the former date 2,584 persons were relieved gratuitously on the works, against 3,420 persons on the latter date; the average attendance during March being 10,475 as compared with 11,749 in February. The steady decrease is due partly to rabi harvestings, and the holi festival but principally to the large sums expended in famine loans. The Court of Wards in this district is said to have spent Rs. 1,832 during the month. 385 works were open on the last day of the month, giving employment to 11,360 labourers of whom 2,167, 5,654 and 3,539 were distributed amongst the Tahsils of Bhandara, Tirora and Sakoli, respectively. In Balaghat the following new works were in progress during the month.

Lanji-Amgaon Road (2 camps).
Bhilewani tank.
Ghoradihi tank.
Bakal tank.

Including persons fed gratuitously the number on relief works increased from 13,374 to 24,019. Relief kitchens have been opened on relief works. The number of persons employed on private works was 14,980, against 16,000 at the end of the previous month, the decrease is said to be due to the mohwa harvest. The only work of this class in Chanda has already been mentioned in last month's summary. To it has apparently been recently added the construction of the Chowki Tank, but no details are to hand.

Physical condition of the people.—The remarks under this head as regards Nagpur, do not contain anything definite but they are clear on one point, no deaths from starvation. The Deputy Commissioner submits some interesting statistics under this head in the statements appended marked E and K. The state of things they indicate is no doubt reassuring, but at the same time I quite agree with the Deputy Commissioner's reservation, "if these figures are to be trusted." In Bhandara, as in other districts, no details are given as to the actual condition of people in receipt of gratuitous relief, attention will be drawn to this. In this district the highest death-rate (48·72) is reported from the Nowegaon. In rural circles where curiously, there is hardly any distress, all the

deaths except eight are reported as due to fever, the next highest (42·12) is reported from the Sakoli Rural circle. 143 out of 230 deaths are reported as due to fever. Increases are most noticeable in the Gondia and Tirora registering circles, being 37·84 against a mean of 18·14, and 27·24 against 19·77, respectively. The Pamir Rural circle shows a considerable increase from 21·10 to 35·88. Distress there is said not to be severe at present, but the advisability of opening relief works there is under consideration. 26 deaths are reported as due to starvation. Of these 7 are reported from Gondia Station House and 5 from Rampaili. 20 of the 26 deaths are returned as unknown wanderers varying in age from 40 to 60, none of the remaining 6 died in the villages in which they resided.

The condition of the people in Balaghat on relief works is said to be fair. I am able to support this opinion from what I saw during my recent visit to that district. But in the poor-houses both at Balaghat and Gondia, I noticed several cases of emaciation. The total number of deaths from all causes has been 2,547 during the month. Of these 236 died of cholera. 48 deaths are reported as due to starvation as against 233* in February. The death of an old man of 90 is reported from Chanda, as due to starvation but from enquiries the Deputy Commissioner says he has no hesitation in ascribing the death to natural causes.

* The Deputy Commissioner has shown this to be incorrect—*vide* this office letter No. 3692, dated 10th instant. The correct No. is 33.

Food stocks.—Reported to be ample in Nagpur. 83,234 maunds of grain were imported and 24,938 exported by rail during the month as against 66,971 and 20,932 respectively in the previous month. The exports were chiefly to Wardha, Hinganghat, Burhanpur and districts in Berar. 41,972 maunds of grain were imported and 1,945 exported by road. In Bhandara the stocks are reported to be generally sufficient except on the Arjuni relief works, where the necessity for arranging for a grain contractor is contemplated. The imports and exports are 26,491 and 20,138 maunds respectively by rail during the month. The rabi crops on the whole are said to have yielded an 8 to 10-anna outturn; much of the produce having been exported to other districts in exchange for common rice. The food stocks in Balaghat are reported to be insufficient. 1,362 maunds of food and seed grain were imported for Baihar by a contractor named Haroosao. The Deputy Commissioner reports that imports cannot be ascertained with any precision, but does not explain why. From Chanda, the imports and exports of grain are reported to be 3,256 and 11,660 maunds respectively. The condition of the food stocks is not stated, nor indeed any remark made in reference thereto, but as the late grain is being exported, apprehension arises that in some parts of the district, stocks will run short before long.

General condition and prospects of affected areas.—Is generally reported as unchanged. The damage to the mohwa crop by cloudy weather, and the exportation of the whole of the produce of the Pauni Chawras have caused some distress near Pauni and in the Pauni Haveli. The Deputy Commissioner, Bhandara contemplates opening a relief work here and hopes it will be possible to close all relief work by 15th July next, but expects some further relief may be necessary in September.

In Balaghat the mohwa crop although below the average is at present affording relief to the destitute. In Chanda the Deputy Commissioner does not anticipate the necessity for any more relief works beyond the scheme of tank repairs now in hand, but expects that a few forests will have to be thrown open later on.

Changes in the rates of wages.—There has been very little variation. In Bhandara wages were paid at 9½ seers per rupee, but owing to a rise in prices payments will probably have to be made at 7 seers per rupee. In Balaghat wages are paid on the basis of 8 seers per rupee.

State of crime.—In Nagpur, burglaries have increased from 28 to 80 and thefts from 47 to 190, but no details are given. In Balaghat thefts against property are on the increase. The jail is reported to be overcrowded and arrangements are being made for constructing huts outside it. Mr. Fraser and

I explained on the spot to the Superintendent how this can best be done. In Chanda an increase of petty crime is reported throughout the district, principally thefts of small value, the increase being most marked in Talodhi Station House circle and in the Brahmapuri Tahsil.

Nerbudda Division.

Private relief.—The system of private relief on a large scale is now being organized by the District Charitable Fund Committee and operations will shortly be begun. Meantime the various Mission Societies in the district have continued to give relief both through their orphanges and by providing work.

Hoshangabad.

During the month under references 75 persons were relieved in the district by private charity at a cost of Rs. 114-15-3. On receipt of the instructions from the Honorary Secretary of the Indian Famine Charitable Relief Fund, Central Provinces, Rs. 1,009 were raised by private subscriptions for local relief. Rai Bahadur Seith Tikaram continued to feed needy persons in the town of Narsinghpur. There are no private institutions for famine relief in the district.

Narsinghpur.

In Burhanpur Rs. 101-8-0 were subscribed in March 1897. This sum is spent in affording gratuitous relief by a Committee. Total expenditure up to end of March Rs. 1,165. The attendance on 27th March was 169 against 121 at the end of February.

Nimar.

In Khandwa Rs. 42 were subscribed in March 1897. This money has not yet been spent.

Poor-house relief:—Two poor-houses were open during the month and a third was sanctioned for Hurda and will be opened shortly. Hitherto there has been a private poor-house there but the funds have become exhausted.

Hoshangabad.

The number of inmates has steadily risen from 545 on the 28th February to 770 on the 27th March.

The condition of the inmates has improved and it has been found possible to send several batches to the relief works.

In Hoshangabad poor-house there were 25 deaths during month on an average population of 315, and in Sohagpur 24 deaths on an average population of 334.

The number of persons receiving treatment during the month at each institution was :—

Hoshangabad	...	...	66 in-patients, 128 out-patients.
Sohagpur ...	...	...	78 „ 103 „

There were 3 Government poor-houses at Narsinghpur, Gadarwara and Chhindwara. None were opened during the month. The number of inmates on the date of the report (*i.e.*, 27th March 1897) in each of these institutions was respectively 944, 727 and 148 ; being an aggregate of 1819. On the last day of the preceding month the numbers were Narsinghpur 955, Gadarwara 667 and Chhindwara 183. Total 1805.

Narsinghpur.

There are two Government poor-houses, one at Khandwa and the other at Burhanpur—

Nimar.

Attendance on 27th March 1897	...	...	136
„ at the close of February	...	...	105

Village relief.—The village relief is gradually being organized. In the Hoshangabad Tahsil 300 persons are at present in receipt of relief. In the Seoni Municipality there are 103 persons similarly relieved and lists for Harda and Hoshangabad have been approved by the Commissioner.

Hoshangabad.

The list for Sohagpur Municipality is now ready and lists for village relief in the Sohagpur Tahsil have been passed but the Circle Inspectors have not reported if the payments have been made.

Those for the Seoni Tahsil are being examined and the list for one circle of the Harda Tahsil has been passed.

The question of this form of relief will be carefully examined during this month with a view to see that the relief granted is sufficient. The Police continued to do good work during the month. 302 persons were sent to the poor-houses, and 278 persons to relief works.

There were 21 relief centres* at the Police station houses and outposts. The numbers gratuitously relieved at these centres on the last day of the period under report were 213, as compared with 884 of the preceding month. No regular works were opened at any of these centres. No new centres were established during the month. The number of persons relieved in their houses on the same date was 378, as compared with 324 in the previous month.

Narsinghpur.

* These are not relief centres in the sense in which the term is understood in the Jubbulpur division. Wanderers in a reduced state are fed at Police stations and passed on to poor-houses or relief works.

Nimar.

Attendance at the Harsud relief centre on
27th March 1897 22
at the close of February 9

On the last day of the month, 27th March, gratuitous relief at home was afforded to 81 persons in 32 villages in hilly tracts. This form of relief will be further extended.

General character of relief works.—The large works under the Public Works Department remained the same during the month, but the numbers of workers rose considerbly owing to the completion of the harvest as the following statement shows :—

Hoshangabad.

Date.	No. of workers.	No. of persons gratuitously relieved.	Total.
28th February 1897 ...	20,209	6,381	26,590
27th March 1897 ...	46,256	9,967	56,223

The numbers in receipt of gratuitous relief have not increased in the same proportion as the workers and the ratio of the one to the other is now more satisfactory.

There was one small village work in the Hoshangabad public garden and another is about to be opened at Sobhapur.

The system of substituting food for a money dole for weakly children has had a good effect in improving their conditions.

There were five large works, all being in charge of the Public Works Department. During the month the Chawar Patha section of the Burmhan-Tendukhera road was opened.

Narsinghpur.

(*a*) Construction of the Gadarwara-Sanikhera road ; earthwork. Number on last day of the month 9,096, as compared with 2,336 of the previous month.

Gadarwara Tahsil.

(*b*) Metalling of Burmhan-Tendukhera road including Chawarpatha section; stone breaking. Number on last day of the month 13,553 as compared with 5,936 of the previous month.

Gadarwara Tahsil.

On these works (A) and (B) I am informed that large numbers of immigrants from Bhopal are employed.

(*c*) Metalling of the Narsinghpur-Lakhnadon road; stone breaking. Number on last day of the month 3,090, as compared with 2,188 of the previous month.

Narsinghpur Tahsil.

(*d*) Metalling of the Saugor-Kareli road north of Burmhan; stone breaking. Number on last day of the month 4,222 as compared with 383 of the previous month.

(*e*) Construction of the Narsinghpur-Sankal road. Number on last day of the month 6,079, as compared with 3,138 of the previous month.

During the latter part of the month under report famine loans to the extent of Rs. 5,875 were advanced to cultivators and Court of Wards estates. Local works such as field embankments were started by the Court of Wards in the villages of Umaria and Dilheri.

Nimar.

The attendance on the Mohghat road which is the only relief work in the district fluctuated.

Attendance on 27th March 1897	...	...	78
,, at the close of February	...	...	192

The fall is ascribed to labourers resorting to the neighbouring Indore territory where grain sells cheap. The classification is agriculturists 21, agricultural labourers 15, ordinary labourers 27, artizans 12, low caste 3, total 78. 24 people belong to this district and 54 are outsiders.

Works with the aid of famine loans, *nil*. Advances have been made under the Land Improvement Loans Act, Rs. 2,250.

Physical condition of the people.—The physical condition of the people on the whole is fair, except in the hill tracts. On the Bagdeo work, the Matkuli and Basaughati works, all in the hilly portion of the district, the death-rate has been high and the number of patients in the hospital large. A statement is attached giving the figures for each work.

Hoshangabad.

In the plain villages the condition of the people is better especially in Seoni and Harda Tahsils, but in Sohagpur I noticed several persons even in the plains who were obviously underfed.

(*a*) Those in receipt of gratuitous relief, were generally more or less emaciated; in some cases very much so and a considerable portion of persons reached the poor-houses in advanced stages of privation and disease.

Narsinghpur.

(*b*) On works the general physical condition was distinctly good, the proportion of B class labourers being large and cases of emaciation very exceptional.

(*c*) In distressed tract generally, that is taking the district as a whole, the physical condition of the mass of the people cannot be said to have been very perceptibly reduced. Very painful sights were indeed to be frequently seen, but considering the population collectively, it may safely be said that emaciation was exceptional.

Nimar. Generally fair except in the case of some old people, women and children in the jungly tracts. Government forests have been thrown open for the free use of edible roots and fruits. On the whole the mohwa crop is fairly good this year.

The number of labourers on the relief work is too small to draw inferences as regards the physical condition of the people.

Hoshangabad. *Deaths due to starvation.*—There were 1,427 deaths during the month of which 23 were due to cholera, 18 to small-pox. There were 18 deaths due to starvation verified by the police out of a total of 85 reported and due to privation, excluding the 110 deaths on relief works and in poor-houses.

The death-rate for the month was 34·7 per mille as against 47·5 in March 1896, excluding towns the death-rate was 32·9 only. As a whole the death-rate is low especially in the Sohagpur Tahsil where the greatest number are on relief works.

Narsinghpur. The number of deaths due to starvation outside poor-houses was 72 as reported by the police. The total number of deaths in the district during the month of February was (*a*) inclusive of towns 1,471 with a death-rate of 4·71 and (*b*) exclusive of towns with a death-rate of 4·21.

In the Narsinghpur poor-house there were 124 deaths or a ratio of 128·09 per thousand during the month against 107 or a ratio of 137·49 per 1,000 in the previous month. Of these deaths four cases were brought to the poor-house in a moribund state due to want of food, three of them died the same day they were brought. In the case of 53 other persons that died illness was induced by want of food, the sufferers having been brought to the poor-house in a very emaciated condition. In the Gadarwara poor-house there were 73 deaths during the month against 104 in the previous month. Of the 73 deaths eight were due to want of food and 45 due to illness and diseases induced by want of food. During the month there were 26 deaths in the Chhindwara poor-house against 25 in the previous month with a death-rate of 167·61. Of the 26 deaths four were due to want of food and 12 due to illness and disease induced by want of food. A copy of the telegram sent by the Civil Surgeon is also enclosed.

Nimar. Outside the poor-house seven deaths have been reported by police from privation and disease.

16 deaths in Khandwa poor-house during March.

11 deaths in Burhanpur poor-house.

Three deaths in Harsud relief centre.

Cholera has broken out in the south-eastern hilly parts of the district. There are reported to have been 88 cases and 44 deaths during March.

During the month 96 persons were forwarded to poor-houses and relief centre and 11 persons to relief works.

DEATH RATIO FOR FEBRUARY 1897.

Khandwa town	...	...	...	...	46·20 per mille
Burhanpur town	...	...	...	...	25·68 ,,
Nimar district...	...	...	...	...	34·92 ,,

This is lower than what it was in January 1897.

Hoshangabad. *Food stock.*—Food stocks are sufficient.

Narsinghpur. There are still no signs of depletion and no complaints.

Nimar. Sufficient.

Importation of grain.—Exports have become less during the month and are principally to Khandesh. The amount exported was 12,460 maunds as against 10,182 maunds for the last fortnight of February.

Hoshangabad.

Imports have increased to 26,349 maunds compared with 5,543 maunds for the last fortnight of February.

As, however, all imports for Betul leave the rail at Itarsi, it is possible that a part of the 7,058 maunds unloaded there was for that district.

No detailed statistics are available on this point but the total imports and exports as reported by the station masters in the district were 9,299 and 31,011 maunds respectively as compared with 5,949 and 16,265 maunds in the previous month. The general destination of exports is believed to have been the North-Western Provinces. The exports exceed the imports.

Narsinghpur.

Exports by rail to places beyond the district 8,892 maunds during March. Imports into Nimar from outside the district by rail was 43,694 maunds during March.

Nimar.

General condition and prospect of affected area.—The harvesting is now over and owing to the short crops and the demand for work the people who cut the crops earned only sufficient for the day and have been unable to save anything. The mohwa is beginning to fall and will provide something for a few of the poorer hill tribes.

Hoshangabad.

In the area shown as most affected there has been practically a total failure of kharif, and little if any rabi sown. In forest villages jungle fruits, &c., will afford some subsistence, othewise the whole population of this area will need relief. In the remainder the average rabi crop is from 6 to 8 annas, but distress is nevertheless severe in view of the fact that only about half the normal *rabi* area was sown and of the succession of bad seasons. A large proportion of the people will probably need relief.

Narsinghpur.

There is no general distress among agricultural population except in the jungli tracts. There are a large number of ryotwari and other tenants there who will require help in the form principally of grain to enable them to remain in their villages. They ought to get help from the Indian Charitable Fund, as they cannot get advances under the Agriculturists Loans Rules. Gratuitous relief at home has been started. The weavers of Burhanpur have again applied to receive advances from Government for the purpose of yarn. This will be given another trial. The gathering of rabi crop is over. The daily labourers are occupied in the gathering of mohwa.

Nimar.

Change in wages.—Prices have as yet shown no sign of falling. The outturn was less than was expected, and there is a general uncertainty as to the future.

Hoshangabad.

There has been no noteworthy changes in rates of wages.

Narsinghpur.

Owing to rise in the price of juar wages have been increased during the month.

Nimar.

Other matters.—Crime decreased during the month while harvesting operations were in progress but began to increase towards the close of the month. Thefts of cattle chiefly for food show the largest increase.

Hoshangabad.

The number of offences reported during the month was 172 against 181 in the previous month and 101 in the corresponding month of 1896.

Narsinghpur.

Crime is on the decrease. During the month there have been 16 cases of housebreaking and 21 of theft.

Nimar.

No. 96 C., dated Pipaldhana, the 5th April 1897.

From the Deputy Commissioner, Chhindwara, to the Commissioner, Nerbudda Division.

I have the honour to forward monthly famine Statements A and B in duplicate together with the monthly report on famine relief for March 1897. The duplicate famine map will be forwarded from the office at Chhindwara.

(1) *Private relief* has been confined during the month to the Municipal town of Chhindwara. The number of recipients during the month was the same as in February, namely, 118.

(2) No change has occurred in the number of *poor-houses* in the district.

One is located at Chhindwara and the other at Amerwara. On Saturday the 27th of March, the number of inmates in these institutions was 161 and 109 as compared with 170 and 129 on the 27th of February. The decrease is due to inmates being discharged as fit for employment on relief works, while the rate of admissions fell off owing to the employment afforded by harvesting and in the last week of the month by mohwa picking.

(3) *Village relief.*—

(*a*) *Relief centres.*—At present these have only been found necessary in the jagirs. The number of centres (15) is the same as last month. The numbers of recipients of gratuitous relief at these centres have increased from 896 on the 27th of February to 1,388 on the 27th of March. This increase is due to systematic village to village inspection by Circle Inspectors, and to the fact that people in the jagirs are getting over the doubts as to the motives of Government relief, which at the outset made many refuse it when offered to them. The number of persons relieved in their homes is 201 as compared with 198 last month. This form of relief is limited to the Amerwara Revenue Inspector's circle in the Chhindwara Tahsil.

(4) *General character of relief works.*—There has been no change during the month in the large works in the charge of the Public Works Department. The following statement shows the variations in the numbers on each work as compared with last month's figures :—

Name of work.	Numbers on 27th February.	Numbers on 27th March.
Construction of Chhindwara-Narsinghpur road	3,375	4,040
Metalling of Matkuli-Belgaon road	1,524	1,584

The increase in the numbers of the workers on the Chhindwara-Narsinghpur road is consequent on the completion of harvest operations. The mohwa crop does not appear to have influenced the numbers on this road as it has in the case of other works, owing, as far as I have been able to ascertain, to the crop being rather backward in this part of the district.

The numbers on the Matkuli road fell in a marked manner as soon as the harvest in the Nerbudda valley began to be reaped and have not risen again to their former level.

This is I think to be attributed in part to mohwa collection, but it is not improbable that harvesters have joined works in the Hoshangabad and Narsinghpur districts.

The smaller works (columns 5 and 7 of statement B) are the same as for last month.

(*a*) The numbers on the Umreth-Bhataria road increased from 1,090 in the end of February to over 1,700 during the month but with the beginning of mohwa collection fell to 1,311 on the 27th of March.

(*b*) Other small works consist of the three tanks under construction at Harrai, Dhondra in the Sonpur jagir and Tamia in the Bagara jagir. The Sonpur Jagirdar has not submitted proper returns, and they have not been incorporated in the statement for the month. The numbers employed appear to have been between 800 and 900 on the 27th of March. The numbers on the Harrai and Tamia tanks were 930 and 349 on the 27th of March as compared with 730 and 379 at the end of February. The numbers rose during the month but fell with the commencement of mohwa collection.

5. *Physical condition of the people.*—The physical condition of the relief workers shows a marked improvement compared with what it was in December. Cases of emaciation are rare in the khalsa, and were so when I visited the work at Harrai at the commencement of the month, but I am informed that numbers of people who left the jagirs for harvesting in Narsinghpur were unable to get employment and came back in a starving condition. During the month besides visiting Harrai and the works in the Amerwara circle I went through the whole of the Sansar Tahsil and was only able to find one starveling who turned out to be an emigrant from the Betul district who had come to stay with his relatives. In the Khamarpani Pargannah where at one time distress was anticipated I saw many Gond women during the Holi festival with Rs. 30 worth of silver ornaments round their necks and nearly all, labourers as well as cultivators, had large silver ear ornaments which must have cost 4 or 5 rupees. The physical condition of the people in this part was as might be expected excellent. There was a similar absence of emaciated persons in Aser and Umreth Pargannahs where the people have only just come to the end of the bean crop ("sem") which they sow in their baris and will now have an adequate food-supply in the mohwa crop. The parts of the district where distress is so acute that starving people are in evidence are the jagirs and a few villages of the Amerwara Circle. The condition of the people in these tracts has from all accounts not varied much since my last report.

During the past month, however, I have not had an opportunity of inspecting the condition of people at relief centres in the jagirs.

6. *Deaths from starvation.*—No return of deaths from starvation has at the time of writing been received from the Police. The death-rate for February is, however, lighter than it was in either 1895 or 1896 as the following figures will show :—

Death-rate for	February 1897.	February 1896.	February 1895.
Chhindwara Tahsil	2·02	...	...
Sansor Tahsil	2·22	...	...
Chhindwara district	2·09	3·94	2·23

7 & 8. Food stocks are adequate and no imports of grain worthy of notice occurred during the month.

9. The harvest has afforded comparatively little employment this year owing to the enormous number of harvesters. The harvest in the Chanrai Circle which nominally provides employment to labourers for over a month was finished in a fortnight, harvesters being ready to work for one-half and even one quarter the ordinary wage in kind.

The poor classes, however, have a great standby in the mohwa crop, which though damaged by cloudy weather is estimated as providing nearly two months' supply of food in the Chhindwara Tahsil, while accounts from the jagirs indicate that the crop there is very fair. This removes any anxiety that there might have been as to the means of subsistence available for cultivators during the ploughing season, when it will be necessary for them to leave relief works and return to their villages.

10. The wages during March were fixed on the assumption that the price of the staple grain juari was 11 seers per rupee.

11. There was no noticeable increase in crime during the month, but petty thefts continue to be numerous.

Copy of a Note dated 9th April 1897, *by the Deputy Commissioner, Betul.*

1. No subscriptions were raised for private relief during the month. The balance of the amount previously raised is being expended in gratuitous relief in municipal towns. The amount expended during the month was Rs. 505-1-0 and 106 persons were in receipt of relief at the end of the month as compared with Rs. 215 and 153 persons in last month.

2. Only one poor-house was open during the month, that at Badnur. The number of inmates on 7th April was 285 as compared with 345 on 7th March.

3. Four relief centres were open at the end of the month as compared with one in last month, three new centres having been opened at Chicholi, Kheri and Shergarh.

(*a*) The number of persons in relief centres gratuitously relieved on the last day of the month at these centres was 30 as compared with 19 of last month.

(*b*) No persons were at work at or near relief centres.

(*c*) The number of persons on village relief was 1,008 in Betul Tahsil and 96 in Multai as compared with 388 at the end of last month. The increase is owing to the fact that last month the system was not in full operation, and complete returns had not been received. The system was described in last month's report.

4. The large works open during the month were :—

(1) Stone breaking and moorum collection on the Itarsi road at Shapur.

(2) Earthwork and ghat cutting on the Badnur-Ellichpur road.

(3) Earthwork and ghat cutting on the Badnur-Harda road.

The numbers were as follows :—

	On last day of present month.	On last day of previous month.
On (1)	3,585	5,192
„ (2)	3,759	2,069
„ (3)	1,304	6,839.
Total	8,648	14,100

No large works were opened during the month.

No local works were open.

Rupees 1,230 have been advanced as famine loans, but no figures are available yet as to the number of persons or works carried out with the aid of such loans.

5. (*a*) The physical condition of people in receipt of gratuitous relief is generally bad as they are mostly old and broken down in health.

(*b*) The condition of the people on relief works is generally good and cases of emaciation are not frequent.

(*c*) The condition of the poorer classes in the distressed tracts is poor but cases of emaciation are not frequent.

6. The death-rates for February were as follows :—

	Excluding cholera and small-pox.	
Betul Tahsil.		
Rural Circles	41·24	38·90
Towns	46·71	46·71
Multai Tahsil.		
Rural Circles	40·61	39·17
Towns	78·74	54 77
Total	41·58	39·43

7. There seems no reason to fear that private trade will not be sufficient to maintain the supply of food grains.

The falling of the mohwa flower has afforded a supply of food for the poorer classes. The mohwa trees have this year flowered abundantly, and only slight damage is apprehended from cloudy weather.

8. Imports and exports have been as follows during the month :—

	Wheat.	Juari.	Tur.	Teora.	Gram.
Imported	2,140	275	50	650	1,450
Exported	250	...	...	50	...

9. The general prospects of the affected area are only changed in so far that the poorer classes are obtaining a small supply of food by collecting mohwa. Future prospects chiefly depend on the extent to which seed will be available for kharif sowings.

10. Wages have been calculated on the scale of 9 seers per rupee during the month as compared with 10 seers during the last month. The change having been effected from first week of the month.

11. There have been a great many petty thefts of grain during the month, but there have been no serious outbreaks of crime. Cholera appeared among the relief workers on the Badnur-Harda road but now that the work has been moved a distance of some seven miles, the outbreak has ceased.

Chhattisgarh Division.

1. *Private relief.*—In the Raipur district private relief is afforded at Bisrampur, where a poor-house is maintained by the American Mission from funds raised in America. At Gandai local subscriptions maintain what is practically a relief centre, but has hitherto been reported as a poor-house.

In the Bilaspur district Rs. 6,900 are reported to have been raised in private charity, a part of which represents subscriptions to the Indian Famine Charitable Relief Fund. The Deputy Commissioner, Raipur, does not report what amount was subscribed towards this fund in the district. I have drawn his attention to the omission.

2. *Poor-house relief.*—There are now four Government poor-houses in the Raipur district, *viz.*, at Raipur, Simga, Baloda and Drug. The poor-houses at Arang and Dhamda were closed under the orders of the Chief Commissioner, and one was opened at Drug during the month.

There are also four poor-houses in the Bilaspur district, *viz.*, at Bilaspur, Pendra, Mungeli and Pandaria. The Pendra poor-house was opened during the month.

In both districts, there is a tendency for the numbers in the poor-houses to increase largely. In the Raipur district the number of inmates on the 27th March was 1,859 as compared with 1,298 in February. In the Bilaspur district the figures were respectively 2,878 and 1,988.

3. *Village relief.*—Twenty-one relief centres are reported to be in existence in the Raipur district at which 367 persons were relieved. No statistics of village and town relief are given. From the weekly reports for the four weeks ending 27th March, it appears that village relief was granted in 234 villages to 1,977 persons.

In the Bilaspur district there are three relief centres, *viz.*, at Bhatapara, Kargi and Pendi. The Pendra relief centre was converted into a poor-house. Two other relief centres, *viz.*, at Lormi and Marwahi were reported in the weekly returns, but these have apparently been closed. As regards works attached to relief centres, a local work has been opened close to Kargi, and the road work under the Public Works Department is only a few miles from Bhatapara relief centre. Village relief is reported as having been given to about 3,600 persons.

4. *General character of relief works.*—A new road work was started in the Raipur district during the month, *viz.*, the second section of the Drug-Balod road. The total number of relief workers on roads under Public Works Department was 39,213 against 16,857 in February. The number employed on local works started by Government and by private individuals was 36,974 against 20,328 in February.

Six roads are being constructed by the Public Works Department in the Bilaspur district. Of these three were opened during the month, *viz.*, the road at Bilaspur to the railway station, the Kota-Lormi and the Parasi-Pendra roads. The number of relief workers on all roads amounted to 14,697 against 10,976 in February. As regards local works in charge of civil officers 1,359 persons were employed on these works. A large embankment work at Pendra in charge of the Public Works Department also gave employment to 828 persons. The number of persons relieved by the grant of famine loans and by works started by private individuals without the help of these loans has not been started. The Deputy Commissioner's attention has been drawn to this omission.

5. *Physical condition of the people.*—The condition of the people is stated to be fair in the Raipur district. New arrivals for relief are reported to be generally weakly and somewhat in a starved condition. The attention of the Deputy Commissioner has already been drawn to the meagre information on this important subject, and I have asked the Deputy Commissioner to report whether information as to the physical condition of the people in distressed parts is systematically furnished to him by his subordinates.

In the Bilaspur district the people of the Pendra zemindari are the worst off, the largest number of deaths from starvation being reported from this part of the district. Cases of emaciation are reported to be numerous at Pendra, and many of the people admitted into the poor-house reach it in a dying condition. In other parts of the severely affected tracts also cases of emaciation are met with though they are not so numerous as in Pendra. Some cases are also reported for the slightly affected parts of the district. As regards relief works, the condition of the people is reported to be good except in Pendra.

6. *Deaths from starvation.*—For the Raipur district 31 deaths have been reported, but the Deputy Commissioner does not place reliance on this figure. The agency for reporting these deaths in the district has not yet, it is feared, been properly organized and special attention will be invited to the matter.

In the Bilaspur district, 569 deaths are returned as having occurred from starvation, of which 274 occurred in Pendra alone.

7. *Food stock.*—Food stocks are sufficient everywhere except in parts of the Pendra and Pandaria zamindaris of the Bilaspur district and in the North-Western zamindaris, and the zamindaris of Dondi-Lohara and Khujji in the Raipur district.

8. *Importation of grain.*—Exports continue to be large in the Raipur district, 1,72,437 maunds of food grains were exported as compared with 1,48,947 in February. The imports were inconsiderable, amounting to 637 maunds against 861 in February. In the Bilaspur district 18,305 maunds were exported against 22,675 maunds in February. The imports were respectively 24,740 and 11,560 maunds. The increased importation has been chiefly to Pandaria and Pendra, where a deficiency of food stock has been reported.

9. *General condition and prospects of affected area.*—The Deputy Commissioner, Bilaspur, reports that the rabi crop has been good, but the areas sown are inconsiderable. The mohwa crops have also been plentiful in some parts. He does not, however, expect any general improvement in the district till November. In the Raipur district, the organization of relief has been more complete and in this way the people are better off. It is not, however, as yet possible to speak confidentially of the prospects of the future.

10. *Rates of wages.*—No changes in the rates of wages are reported for either districts. The Deputy Commissioner, Bilaspur, expects the rate to increase on some relief works, where grain is selling dearer.

The Deputy Commissioner, Raipur, reports that there has been no serious increase in crime. The number of cases in the Bilaspur district is slightly less than in the last month. Three dacoities were perpetrated in the past month in this district.

No. 667 C., dated Pachmarhi, the 20th April 1897.

From M. W. Fox Strangways, Esq., I.C.S., Offg. Chief Secretary to the Chief Commissioner, Central Provinces, to the Secretary to the Government of India, Revenue and Agricultural Department.

In compliance with the request contained in your Circular No. 13–F.–84–2, dated the 10th February 1897, and your subsequent endorsement No. 17–84–12, dated the 13th March, I am directed to submit a statement received from the Administrative Medical Officer and Sanitary Commissioner, showing the death-rate per mille per mensem for March 1897 in the 18 districts of these Provinces with the exception of Saugor, the figures of which have been telegraphed for and will be communicated on receipt.

2. It will be seen that there has been a decrease in Damoh (from 4·3 to 3·4), Jubbulpore (from 9·1 to 7·7), Hoshangabad (3·2 to 2·9), Mandla (7·1 to 6·7), Chanda (1·7 to 0·9) and Sambalpore (1·9 to 1·4), an increase in Nimar (2·9 to 3·3), Betul (3·5 to 4·8), Chhindwara (2·1 to 2·5), Balaghat (4·8 to 6·7), Bhandara (2·6 to 2·9), Nagpur (1·8 to 2·0), Wardha (1·7 to 2·0), Raipur (2·2 to 2·9) and Bilaspur, (3·9 to 5·2), while in Narsinghpur (4·0) and Seoni (4·4) the figures for February and March are the same.

The highest death-rates shown for March are :—

Districts.	Death-rate.	Deaths from		Death-rate excluding cholera and small-pox.
		Cholera.	Small-pox.	
Jubbulpore	7·7	376	12	6·5
Mandla	6·7	392	2	5·6
Balaghat	6·7	241	15	4·5
Bilaspur	5·2	818	59	3·0
Betul	4·8	114	31	4·4

It will be seen that in these districts of heavy mortality a substantial portion of the death-rate is due to epidemic disease. Cholera was particularly fatal in Bilaspur and Mandla. In other districts also (not included in these highest death-rates) epidemics accounted for a larger proportion of the mortality. Thus in Damoh out of 1,105 deaths 464 were due to cholera, in Bhandara 237 out of 2,139, and in Raipur 203 out of 3,656, besides 215 due to small-pox.

3. The number of deaths reported from starvation in March has been given by the Administrative Medical Officer in the last column of his statement; but the Chief Commissioner finds on examination that the figures do not correspond either with the figures adopted by Commissioners in their monthly reports for March recently submitted to the Government of India, nor with some of those returned in the Weekly Famine Reports from districts. He prefers therefore to make further enquiry into them before reporting them to the Government of India and they will accordingly be sent up with the figures of the next month.

Statement showing the death-rate for the month of March 1897 and ten previous years.

No.	Districts.		Death-rate for March 1897.	Average death-rate for 10 previous years.	Excess over normal.	Remarks.

No. C. 678, dated Pachmari, the 21st April 1897.

From M. W. Fox Strangways, Esq., I.C.S., Officiating Chief Secretary to the Chief Commissioner, Central Provinces, to the Secretary to the Government of India, Revenue and Agricultural Department.

I am directed, in continuation of my No. C. 667* of yesterday's date, to submit a supplementary statement showing the death-rate for the month of March in the Saugor district. 232 of the 2,508 deaths were due to cholera or small-pox.

Supplementary statement showing the death-rate for the month of March 1897.

District.	Death-rate for March 1897.	Average death-rate for 10 previous years.	Excess over normal.
Saugor	4·2	2·7	1·5

No. C. 893, dated Pachmarhi, the 17th May 1897.

From M. W. Fox-Strangways, Esq., I.C.S., Offg. Chief Secretary to the Chief Commissioner, Central Provinces, to the Secretary to the Government of India, Department of Revenue and Agriculture.

I am directed to submit, for the information of the Government of India, consolidated monthly statements (for April) A and B as prescribed by section 16, IV-VII of the Central Provinces Famine Code. Figures are now, for the first time, given for every district of the Provinces, relief operations, to a greater or less extent, being now carried out in each. The usual memoranda by Commissioners of Divisions, and famine maps, are also forwarded.

2. The total numbers in receipt of relief have risen from 479,273 at the end of March to 534,420 at the end of April. During March, temporary reductions in the numbers on works were caused, first by the employment afforded by the harvesting of the *rabi* crops, and afterwards by the occurrence of the Holi festival. Harvesting was practically over in all districts by the beginning of April, and the first weekly returns for that month showed a sudden and large increase in the numbers on works. The ripening of the *mohwa* crop caused another reduction, and during the 2nd and 3rd weeks the numbers fell by some 15,000 to rise again largely during the fourth week when the collection of *mohwa* was practically over. The reports received as to the out-turn of this crop are somewhat conflicting. The trees were late in coming into flower, and much damage was anticipated from the cloudy weather and thunderstorms at the end of March. In the end, however, it appeared that the actual damage done was much less than had been anticipated, and that in most parts of the Provinces where *mohwa* trees are plentiful the crop was little, if at all, below the average. From all districts it is reported that the crop has been a most valuable addition to the food supply of the poorer classes, and it is believed that much has been stored by the people for consumption during the rains.

3. It was noted in the report for March that the effect of the *rabi* harvest in lowering prices had been very slight, any tendency to a fall being corrected by export to the North-Western Provinces. During April there was a great contraction of export and in several districts imports became considerable. Prices have continued to rise slowly but steadily.

4. The question of the sufficiency of food stocks, especially in the districts of Mandla and Balaghat, which was referred to last month, has continued to engage the attention of the Chief Commissioner and of his officers. Proposals for supplementing the deficiencies of private trade in the Mandla district have recently been sanctioned by Mr. Lyall and the details submitted to the Government of India, and a similar scheme is being worked out for the up-land portion of Balaghat. For the rest, nothing has occurred to cause the Chief Commissioner to alter the opinion expressed last month that private trade will do all that is required.

5. The monthly death-rates reported in column 15 of Statement A show on the whole an improvement. It is true that the number of deaths in the Provinces as a whole has increased. But this is largely due to cholera which was present and more or less active in 17 out of the 18 districts. It was especially severe in Narsinghpur which shows an abnormally high death-rate. No district shows so high a rate as has been reported in previous months for Jubbulpore. The figures will be examined in greater detail in the special mortality return for the month, which is being separately submitted.

6. It will be observed that columns 6 and 7 of Statement B show sufficient work in reserve for the maximum number for whom relief is likely to be required in all districts except Nagpur, Wardha, Chanda, Sambalpur and Raipur. The first four of these districts are not seriously affected by famine and the numbers now on relief are very far below those shown in column 2. The Raipur programme has recently been very largely extended, and provision has been made for the establishment, if necessary, of 28 charges which would employ not less than 140,000 people. There is therefore no fear that employment will run short.

Monthly Famine Statement A for the four weeks ending Saturday evening the 24th April 1897.

[To be submitted t tohe Government of India within the first-half of the next month.]

Summary to accompany monthly Famine Statements A and B for the month of April 1897.

Jubbulpore Division.

1.—*Private Relief.*

The organisation of this class of relief through the Agency of the District Committees of the Indian Famine Charitable Relief Fund has proceeded during the month on the lines indicated in my report for March. Clothing has been given to the destitute on relief works and in poor-houses. Extra diet has been provided for the sick and weakly in poor-houses, at relief centres and in the kitchens on large works, payments have been made for the support of famine orphans taken charge of by philanthropic or missionary societies and money has been given to those of the respectable poor who are averse to seeking relief in any public fashion.

Comparatively little has, however, been spent on any of these objects as it is becoming more and more clear that the maximum of relief which can be afforded by this fund will be given by enabling destitute cultivators to buy seed and plough cattle to enable them to sow and reap their little holdings, and thus once more acquire a small reserve against future need. It is indeed probable that, had the many charitable people in England and elsewhere fully realised the inestimable benefit which will result from each pound which can be devoted to this purpose, the subscriptions, liberal as they have been, would have been doubled. As it is, the allotments made to districts will, in most cases, not be sufficient to meet all their needs, though they will certainly suffice to effect an immense amount of good. Where the whole amount needed for each cultivator cannot be given a portion of it will be granted so that as many as possible of those who are really destitute may at least be able to sow some portion of their land, and, should the crops be good, be in a better position to arrange for their winter sowings. The details given in the district reports of the work done and the actual number of persons relieved by the charitable fund are not as full as I should have wished and I have asked the Deputy Commissioners to obtain more definite and precise information from the Secretaries of the District Committees for inclusion in future reports.

I may add that the work of completing the lists of those destitute cultivators who are to be recipients of grants from this fund, has been completed in all districts while in Seoni and Jubbulpore actual distribution has begun. The bulk of this work will, however, be carried out during the current month, and acting on a suggestion made by the Chief Commissioner (*vide* Revenue Secretariat No. 2169 of 23rd April 1897) the services of Civil Judges and Munsiffs, whose courts will be closed from the 15th current, will be utilised to assist the members of the several District Committees in the work of distribution.

2.—*Government poor-houses.*

The following is a comparative statement of the number of poor-houses in the division and of the number of inmates on the last Saturday of March and April respectively :—

District.	Number of Poor-houses.		Number of Inmates.		+ or —
	March.	April.	March.	April.	
Jubbulpore	5	5	2,241	2,715	+474
Saugor	5	5	3,373	3,381	+ 8
Damoh	4	4	1,146	1,104	— 42
Mandla	2	2	499	551	+ 52
Seoni	2	2	558	430	—128
Total	18	18	7,817	8,181	+364

The general decrease which characterised the figures for March as compared with those of the previous month was ascribed by me in last month's report to the more complete organisation of village relief and to the fact that the temporarily incapacitated inmates of poor-houses were, on recovery, being returned to their homes. It would have been thought that these cases would have continued to operate during April and that a further general decrease would have occurred. That this did not happen is, I think, chiefly due to the fact that numbers of harvesters who had not earned enough to support themselves and who were too weak for regular work have been filling our poor-houses during April. In the Jubbulpore district especially, the number of these wanderers was very large and the Police have done what they could for their relief by sending them to the poor-houses. In Jubbulpore itself, however, I found that this was being carried too far, and that numbers of perfectly healthy and indeed robust people were being sent to the poor-houses because they had been found begging in the bazaar. Such persons should be sent to a relief work, and arrangements have now been made to have them collected periodically by the Police and sent by rail to a large Public Works Department work at some distance from the city whence they will not so easily be able to return there to beg.

Arrangements for completing and strengthening existing poor-house buildings so as to ensure their giving adequate shelter during the monsoon have been vigorously pushed on during the month. I have also endeavoured to secure a better organisation and more regular attendance of the existing poor-house committees and also to put the head-quarter orphanages on a more systematic footing, especially as regards the provision of suitable occupation for the numerous children of varying ages and capacities who are to be found there.

Owing to the large number of wanderers always to be found in the Jubbulpore district it has been decided, with the Chief Commissioner's approval, to convert some of the existing relief centres into rural poor-houses for the monsoon months, and I have addressed other Deputy Commissioners with a view to ascertaining whether similar arrangements would be advisable elsewhere.

3. *Village Relief.*

The following table compares the number of relief centres open at the end of March and April respectively :—

District.	No. of centres.		Relieved gratuitously.		At work at centres.		Total.		+ or —
	March.	April.	March.	April.	March.	April.	March.	April.	
Jubbulpore ...	17	17	1,931	2,065	11,965	10,548	13,896	12,613	—1,283
Saugor	3	...	105	...	15	...	120	...	—120
Damoh	...	...	...	...	...	...	...	...	...
Mandla	17	17	901	830	3,233	3,111	4,134	3,941	—193
Seoni	9	8	161	143	681	561	842	704	—138
Total ...	46	42	3,098	3,038	15,894	14,220	18,992	17,258	—1,734

In Jubbulpore the reduction in numbers, which was anticipated, was delayed owing to the failure of one of the circle relief officers in the Murwara Tahsil to give effect to the orders which had been given to him. These orders have now been carried out and the present month will show a large reduction in the numbers so relieved in this district. In reducing numbers, however, the greatest possible care is being taken to provide for those who are now being relieved in this way, and every effort is being made to prevent further distress. But, except to provide for weakly and emaciated wanderers or to meet the needs of wild and

inaccessible tracts, like large parts of Mandla, the relief provided at these centres has not proved economical or effective as regards the exaction of a sufficient amount of work in return for wages paid. They are, therefore, being steadily reduced, some being converted into rural poor-houses to provide for wanderers during the monsoon months, and others being closed altogether. In Mandla where the area to be dealt with is very large, the same number of relief centres as are now in existence will, however, be maintained throughout the rains and it may similarly be necessary to maintain some of the centres in the more remote parts of Seoni.

(*b*) *Relief of people in their homes.*—Village relief has now been completely organised in all districts though it needs very constant and rigorous supervision to secure, on the one hand, that money reaches those for whom it is intended and, on the other, that it is not given to those who either have enough means to do without it, are fit for labour even though it be of a light description, or have relatives who are capable of maintaining them. I had an opportunity, during the month of checking village relief in Mandla and Damoh and I found that it needs a most careful and detailed enquiry and considerable experience of the normal conditions of village life to prevent abuses in one or other of the above directions. The number of people entered on the register as in receipt of this class of relief is compared below with the corresponding figures of the previous month :—

	27th March.	24th April.
Jubbulpore	17,849	17,064
Saugor	7,010	9,485
Damoh	6,000	7,040
Mandla	670	1,011
Seoni	995	1,500

There has been an increase in every district except Jubbulpore, a result largely due to the return of the poorer class of labourers from harvesting. The apparent decrease in Jubbulpore appears to have been due to the figures having been incorrectly reported in the previous month. The large accession of numbers in Saugor, nearly 2,500, is remarkable, and I am not altogether satisfied that village relief in this district is being confined to its proper limits. No adequate explanation of the very large increase has been given by the Deputy Commissioner, and I have recently asked him to arrrage for a careful enquiry by himself and his circle officers with a view to ascertaining whether the very considerable additions to the village lists have been properly made. The increase in Mandla is satisfactory, as I had found that in this district the limits of the classes entitled to this class of relief had been somewhat too strictly drawn. On this subject, however, it may be well to quote the Deputy Commissioner's remarks. He says :—

"I may note here that the numbers actually entered as in receipt of village relief only partially represent the extent of true village relief. Unlike other districts, the number of relief centres in Mandla is very large *i.e., 19* (including the local works at the two Tahsil head-quarters) and to each of these relief centres is attached a sort of poor-house on a small scale where people unable to work are relieved gratuitously. The work taken at these relief centres is also very light, so all the people at those centres are practically on village relief. The numbers thus relieved stand as follows :—

1. On two local works at Tahsil head-quarters	801
2. Dependants on Tahsil head-quarters	213
3. At work at relief centres	3,120
4. Fed gratuitously at relief centres	871
	5,005"

I may add that the people of Mandla are, as a rule, but little attached to their homes and are ready to desert them on the slightest provocation. On the large works nearly all the labourers live on the site of the work, and at one relief centre

which I visited I found several people who, though they said they had homes in a village about a quarter of a mile away, preferred to live in huts on the work itself. In such circumstances there is much less scope for village relief proper than in more settled districts.

4. *General character of relief works.*

(*a*) *Public Works Department Relief Works.*—The number of persons on these works at the end of March and April respectively is shown below :—

District.	Workers.		Dependants.		Total.		+ or —
	March.	April.	March.	April.	March.	April.	
Jubbulpore	40,517	39,070	8,247	7,771	48,764	46,841	—1,923
Saugor	29,273	15,168	2,765	1,116	32,038	16,284	—15,754
Damoh	11,267	14,279	2,054	2,065	13,321	16,344	+ 3,023
Mandla	14,236	18,131	3,792	4,931	18,028	23,062	+ 5,034
Seoni	4,761	9,015	1,013	2,069	5,774	11,084	+ 5,310
Total ...	100,054	95,663	17,871	17,952	117,925	113,615	—4,310

It will be noticed that in Jubbulpore numbers have decreased by nearly two thousand, there has been a large increase in Damoh, Mandla and Seoni, while in Saugor numbers have fallen from 32,088 to 16,284 or to nearly half of their former figure. Had the orders which have already been referred to regarding the closing of relief centres in the Murwara Tahsil been properly carried out the Jubbulpore figures would also have shown an increase, and the larger numbers in Damoh, Mandla and Seoni are only what I had anticipated in making my report for March. The remarkable feature then, in these returns is the marked diminution in Saugor—a diminution which had not yet been fully explained by the Deputy Commissioner. It may, however, be noted that, at the beginning of April, extensive frauds were discovered on two of the large works in Saugor, and from the enquiry made in those cases it appeared that the numbers actually at work on the 27th March, were in reality, much less than had been represented. It was also discovered that there had been abuses in connection with the supply of grain on those works, and it is more than probable that there had been other irregularities in the matter of punctual payment of wages, infliction of fines and the like which would have tended to make those works generally unpopular. The fact that the numbers on local works under circle officers in this district have recently increased largerly, tends to confirm the view that the large Public Works Department works have for some reason or other, become unpopular. I have asked the Deputy Commissioner to give the matter his very careful attention and to ascertain, both by personal enquiry and through his circle officers, to what causes the greatly diminished numbers on those works are due. I have also discussed the matter with the Executive Engineer, Saugor, but he is unable to say what has caused this remarkable diminution in numbers. The question of the introduction of the modified system of piece work approved of by the Government of India in Revenue and Agricultural Department letter No. $\frac{722}{110}{}_{2}$ F, dated the 3rd March 1897, is being carefully considered for all districts and since the close of the month orders have been issued to start the new system in parts of Jubbulpore, Mandla and Seoni. At present the great defect on nearly all Public Works Department works is the failure to exact an adequate task, large numbers of the workers being, apparently quite satisfied if they receive the minimum wage even after deduction of fines for short work. The bulk of these labourers are now quite strong and healthy, they have been on Government works for months, and are as competent to do piece-work as any labourer in ordinary times. These remarks apply particularly to Seoni, but may be considered as true

of the greater part of all districts of the divison, and the introduction of piece-work, if associated on each work with infirm gangs for the old and weakly, will, I trust, produce a marked improvement in the out-turn of work while not diminishing the efficiency of relief.

In Jubbulpore the distribution of work was improved by closing three of the existing charges and opening new charges in their place in tracts of greater distress. In Mandla two new charges were opened, one in the Northern and one in the Southern Tahsil, and are both filling rapidly. In Seoni a fourth charge was opened in the distressed area of the Seoni Tahsil. In the remaining two districts the number and distribution of charges remained unchanged.

(*b*) *Local works under district officers.*—The numbers employed on these works, excluding dependants at the close of March and April are shown below :—

District.	March.	April.	+ or —
Jubbulpore	12,886	14,971	+ 2,085
Saugor	9,239	14.354	+ 5,115
Damoh	11,483	10,649	—837
Mandla	1,505	1,779	+ 274
Seoni	1,300	1,131	—169
TOTAL	36,416	42,884	+ 6,468

In Jubbulpore four new local works were started during the month—two tank works in the distressed parts of the Jubbulpore Tahsil and a tank work and a road work in the west and east respectively of the Murwara Tahsil.

All local works in Jubbulpore are now well organized and supervised. Professional opinion has been obtained as to the plan of work in each case and tasks are fixed and exacted.

Of the two municipal works in Jubbulpore City it has been decided to hand over one, the stone breaking work near the town, to the Public Works Department, This will secure better management and stricter supervision. In Saugor three new tank works were started during the month and have attracted considerable numbers over 5,000 workers. Here, also, regular organization is insisted on and adequate tasks secured.

In Damoh no addition has been made to the previous number of local works and the ten tanks, which are in progress, are being steadily completed. I inspected five of these during the month and was pleased with the way in which work was being done. The general organization was exceedingly good, work was systematically carried out and tasks were fixed each day, and, so far as could be ascertained, regularly completed. The Deputy Commissioner has now obtained professional advice to assist him in completing these tanks and it will, I hope, be possible to complete them all before the monsoon breaks.

In Mandla there were besides the 17 relief centres, two local works, at Mandla and Dindori respectively, four forest roads and eight ryotwari tanks, in progress during the month.

In Seoni 16 works in ryotwari villages and two forest roads were available as local famine works. The Deputy Commissioners found, however, that the attractions of the large Public Works Department works were greater than those of local works and he was obliged to adopt special measures to secure sufficient labour to complete his works before the rains. He considers that on the large works less labour is exacted and a more liberal wage given, and he thinks the introduction of piece-work to be the only effective remedy for this. In this view I agree with him.

Famine Loans.—The amounts paid out as Famine Loans during the month of April are shown below in round numbers :—

	Rs.
Jubbulpore	14,000
Saugor	12,000
Damoh	18,000
Mandla	2,000
Seoni	3,000
	49,000

From the diaries of circle relief officers and from what I have heard from Deputy Commissioners I gather that a considerable amount of useful work is being done with the aid of these loans, and that, generally speaking, borrowers are paying a sufficient wage.

5. *Physical condition of the people.*

The Deputy Commissioner, Jubbulpore, who has been almost constantly on tour during the month in the most distressed parts of the district, writes as follows :—

"The condition of the people on the larger relief works is good. Only in the poor-houses and relief centres are cases of extreme emaciation to be met with. Barhi, in the east of the Murwara Tahsil, being the place where I have seen the worst cases in this respect. In the Murwara Tahsil, generally the general health of the people has greatly improved, a good *mohwa* crop having helped greatly to this end."

The Deputy Commissioner, Saugor, has nothing to add to what he wrote last month on this subject and which was quoted in paragraph 5 of the divisional report for March. The decreasing death-rate in this district, combined with the very small number of deaths ascribed to starvation or privation, would point to a steady improvement in this respect.

The Deputy Commissioner of Damoh, who was also on tour during the great part of the month, considers that the condition of the labourers on relief works is distinctly improving and that the additional food supply afforded by the *mohwa* crop has tended to better the condition of the population generally. I had considerable opportunity while on tour in Damoh, of observing the condition of the people both on works and in villages. The average condition of workers was distinctly good, most of them having been doing regular work and receiving regular pay for months past. In the villages I noticed no cases of emaciation, except among the very old. In the poor-houses there were naturally numerous cases of people in very reduced condition. But this must always be the case so long as there are people who prefer to wander and to beg until they are reduced to such a state of weakness that it is almost impossible to restore them to normal health.

A careful watch is kept over the work of the Police in dieting and forwarding such wanderers to poor-houses or works, and, generally speaking, I consider that this work is now well done.

In Mandla the condition of the inmates of poor-house and of those who are relieved at relief centres is, as elsewhere, poor. On works the people are generally robust and healthy. They have, in most cases, been on the works for months and the regular work, wholesome food, good water-supply, and sanitary surrounding have all combined to improve their condition greatly. Except on the Thonda work (Bilaspur-Mandla road) and on the north of the Dindori Tahsil there are but few in hospital, and deaths, except from occasional outbreaks of cholera, are

less common than they are among the general population in ordinary times. The Deputy Commissioner of Seoni reports as follows :—

"The condition of persons employed on Public Works Department relief works is excellent, so much so that I have recommended piece-work to be started on all these works. This proposal has been accepted by the Chief Commissioner and piece-work will be introduced as soon as possible."

In this district generally the Deputy Commissioner informs me that the condition of the people is good and that it has here, as elsewhere, been improved by the extra food supply afforded by the *mohwa* crop. From the result of my own inspection of famine works and of the Lakhnadon poor-house I incline, however, to think that the Deputy Commissioner takes a somewhat too favourable view of the general condition of the people. It is quite true that the greater number of the labourers are robust, but cases of emaciation are not uncommon, and the large number of deaths in the Seoni poor-house during April points to the existence of more suffering than the Deputy Commissioner's remarks would imply. Even allowing for deaths from cholera the death-rate for April is still considerably above the normal (41 per mille per annum) and most careful supervision should, I think, be maintained over relief arrangements especially in those parts of the district which are remote from the main lines of traffic.

6. *Mortality. Deaths from starvation.*

The following table gives the total number of deaths and the death-rate (per mille per annum) for the month of February, March and April.

District.	No. of Deaths.			Death Rate.					
				Exclusive of town.			Inclusive of town.		
	February.	March.	April.	February.	March.	April.	February.	March.	April.
Jubbulpore ...	6,839	5,287	4,014*	102	8,182	128	114	8,818	65
Saugor	2,907	2,595	3,047†	60	54	...	59	53	61
Damoh	1,417	1,871‡	1,592§	...	...	...	52	69	58
Mandla	2,396	2,277	1,430	...	...	...	85	74	50
Seoni	1,621	1,647	1,571‖	...	...	...	52	52	50

* 255 deaths from cholera. † 515 deaths from cholera. ‡ 523 deaths from cholera.
§ 323 deaths from cholera. ‖ 297 deaths from cholera.

The steady decrease in the death-rate of the Jubbulpore District from February onwards in spite of outbreaks of cholera in March and April, and notwithstanding the number of wanderers in the district who had come for harvesting and had to return with little or no earnings, is most satisfactory. During the present month the great heat which has now set in must, however, tell on the old and weakly, and a maintenance of this improvement can scarcely be anticipated. In Saugor, the March figures showed a distinct improvement on those for February, but the April total has been swelled by 515 deaths from cholera. Had it not been for cholera in Damoh there would have been a diminution in the number of deaths in that district both in March and April. In Mandla the great improvement which is shown in the figures for April, an improvement which extends to all the main heads of classification, is satisfactory. In Seoni the April figures are better than those for March, and, if the 297 cholera cases be allowed for, are markedly better.

During the month, I issued a circular letter to all Deputy Commissioners asking them to arrange to have the weekly special mortality returns, which are submitted to Civil Surgeons under the instructions contained in Revenue Department Circular letter No. 1400, dated 31st March 1897, regularly sent to all circle relief officers. It would then be their duty to examine carefully any unusual or

excessive local mortality, ascertain its causes and endeavour to take steps to prevent its recurrence. It is of little or no use to enquire into the causes of the mortality, of past months. The great point is to obtain information of deaths as soon as possible after they occur, to verify anything unusual in them *at once* and to take immediate steps to remove any preventable causes of excessive mortality.

The following statement gives the number of deaths (*a*) due to actual want of food (starvation) and (*b*) due to the effects of privation in March and April respectively. The determination of whether a death is or is not due to privation is a delicate and difficult operation and I do not think that our reporting agency (Kotwars and Subordinate Police Officers) can be relied upon to discriminate these deaths satisfactorily. It may be said indeed that proper verification should make the actual cause of death certain, but where, as is the case with most deaths from starvation, the victims are wanderers without friends or companions who can give any information regarding them, any real verification is quite out of the question, and I do not think that any great weight should be attached to the statistics given under this head. The effectiveness of famine relief can, I venture to think, be much more clearly and satisfactorily gauged by following the progress of the general death-rate, after allowing for deaths from cholera, small-pox or other epidemic disease, than by scrutinizing the returns of deaths from starvation or privation.

With these preliminary remarks I gave the figures for the two months for what they are worth :—

District.	Due to Starvation.		Due to Effects of Privation.	
	March.	April.	March.	April.
Jubbulpore	152	49	1,237	993
Saugor	9	3	255	111
Damoh	14	54	167	244
Mandla	2	1	39	7
Seoni	17	8	131	199

I have had some difficulty in compiling this return and am unable even now to attach much weight to the statistics which it contains. Thus in Jubbulpore the figures, both for March and April, are taken from a special classified statement of deaths from starvation prepared by the Police and attached to the Deputy Commissioner's report. These figures differ largely from those given by the Civil Surgeon in his special mortality return for April, where 222 deaths are ascribed to starvation. I have already, however, detected one glaring error in this return whereby the total number of deaths from all causes in the Panagarh station house area are put down as deaths from starvation, and I incline to think that careful check will detect other similar errors.

For Saugor I accept the Civil Surgeon's figures, no others being available.

In Damoh, in the return received from the Civil Surgeon, I yesterday detected an obvious error, the correction of which by the Deputy Commissioner to whom I referred by wire, has resulted in lowering the number of starvation deaths by 102, and I am now awaiting a reply to another reference which will, I believe, again considerably lower this figure. For Mandla I accept the Deputy Commissioner's figures which have, he reports, been verified, while in Seoni, I have entered the Civil Surgeon's figures for this month and the Police figures for March, a reference to the Deputy Commissioner having shown that the Civil Surgeon's figures for the former month were erroneous. In view of the discrepancies and of the importance which is attached to these figures, I think it would be well to issue further clear and detailed instructions to the Police which would secure greater attention on their part to the correctness of these returns

and also to direct that the returns should, each month, be sent to the Administrative Medical Officer *through the Deputy Commissioner*, who would carefully scrutinise the figures, verify any entries the correctness of which appeared doubtful on the face of them, and add remarks of his own commenting on any abnormal or peculiar features in the return. I may further notice that, in no single case, has the verified statement of starvation deaths prescribed by the Secretariat Circular letter been submitted with the returns, nor have civil surgeons added any remarks regarding abnormal features in the reported statistics.

I may add, that, so far as they can be relied on, these figures show, except in Damoh, where the accuracy of the statistics is exceedingly doubtful, a marked improvement on those of the previous year. This is especially the case in Jubbulpore where there are other reasons for thinking that famine relief arrangements are steadily being made more effective and more complete.

7. *Food-stocks.*

In Jubbulpore, Saugor and Damoh food-stocks are reported to be sufficient. Indeed a brisk export has been going on throughout the month from Jubbulpore. No difficulty is anticipated as to a sufficient food supply for the monsoon months. In Seoni stocks are also generally sufficient, and, as the district is easily accessible both from the north and south, no difficulty is anticipated as to future supply.

In Mandla, as I noticed in the report for March, special arrangements are being made for the supply of food-grain during the monsoon months, (1) to large Public Works Department works, (2) to relief centres, (3) to bazaars in the more remote parts of the district. The whole subject was fully discussed with the Deputy Commissioner during my visit to Mandla in the early part of the month, and a special meeting of grain merchants was held to explain to them the bounty system as approved by the Government of India for the Palamau District in Bengal (*vide* letter No. 1598, dated 17th March 1897, from Government of India, Revenue and Agricultural Department, to the Chief Commissioner, Central Provinces). They all, however, stated that they were not prepared to enter upon trade with the interior where the demand was uncertain and the circumstances of which were strange to them. Accordingly it was determined to invite tenders for the monopoly of supply of food-grain on the large Public Works Department works from June to September, and to make contracts, on the basis of advances at low rates of interest, with small trades for the supply of relief centres and local bazaars. No single tender was, however, forthcoming for the Public Works Department monopoly, but I have now succeeded in inducing the firm of Raja Gokal Dass, Ballab Dass of Jubbulpore, to take the contract for the Mandla Tahsil, while for the Dindori Tahsil the Deputy Commissioner has been given, with the approval of the Chief Commissioner, an advance of Rs. 50,000 to arrange for direct import by Government. Small contracts are also being arranged for the supply of relief centres and bazaars in the interior.

The following table shows the retail prices of staple food-grains in seers per rupee at the head-quarters of each district at the end of March and April respectively :—

District.	Wheat.		Grain.		Common Rice.	
	27th March.	24th April.	27th March.	24th April.	27th March.	24th April.
Jubbulpore	11	10½	11½	11	9	9
Saugor	8¼	8½	9¾	9	5¾	6½
Damoh	7½	8	10¼	9¼	8	7½
Mandla	9	9¼	11	10	8	8¼
Seoni	11	10¾	9	9	9	9

In Saugor, Damoh and Mandla the price of wheat, probably owing to import, has fallen slightly. Heavy exports have hardened prices in Jubbulpore, and in Seoni also there has been a slight rise in price. The price of gram has risen everywhere except in Seoni, where it has remained steady. The slight cheapening in rice in Mandla, where it is much more largely consumed than wheat, is noticeable. This is probably due to large imports. On my return from Mandla I found strings of carts all along the Jubbulpore road carrying grain to the head-quarters of the district.

It will be seen that prices keep, on the whole, very steady and that the comparatively good *rabi* crops in the North-Western Provinces, the Punjab and parts of this Division have had no effect in perceptibly lowering the rates of retail sale. As was remarked in last month's report, a very large surplus is necessary to perceptibly affect the general level of prices where the demand for food-grains is so intense and so universal as it is this year, and where stocks have been depleted by several successive harvest failures.

8. *Import and export of food-grain.*

The imports and exports for those districts where they have been registered are shown below as compared with those of the previous month :—

District.	Imports.		Exports.	
	March.	April.	March.	April.
Jubbulpore	56,855	47,446	85,961	71,978
Saugor	4,237	26,012	5,878	595
Mandla	3,000	5,000	*Nil*	*Nil*
Seoni	8,744	16,124	4,056	6,126

The large exports from Jubbulpore still continue, but the amount exported was not quite so large as in the preceding month. So far, in Saugor, the exports of each month have exceeded the imports, but now, as the Deputy Commissioner points out, "the tide has definitely turned," exports are merely nominal while import exceeded 26,000 maunds. No reliance can, I fear, be placed on the Mandla figures which are mere estimates. I should incline to put the imports into this district at a much higher figure.

9. *General condition and prospects of the affected areas.*

On this subject the Deputy Commissioner of Jubbulpore remarks as follows :—

"The health of the people is steadily improving. The relief operations in progress are gradually producing this effect, and the advent of the *mohwa* crop has conduced greatly to the same end. Cattle are in good condition. It is the general opinion, especially in the northern part of the district, that only the worst of the cattle have been killed off for their hides. I believe that this is to a great extent the case and that the famine has thus been productive of a certain amount of good, in getting rid of the more useless of the village stock. The organization of the relief works both under Public Works and District Agency is being improved. There are, however, individual cases where much remains to be done in this respect The proposed introduction of the piece-work system will, it is hoped, be useful in this direction."

I may add that the *mohwa* crop in this district has been a distinctly good one, averaging some 12 to 14 annas. The Deputy Commissioner of Saugor remarks :—

"I spoke last month of the *rabi* harvest. It was undoubtedly a poor one and has done but little towards ameliorating the material condition of the people generally, though individual cultivators here and there have fared well. The *mowha* crop which has been gathered during the past month was on the whole good. Conflicting accounts used to reach me from time to time as to its quality. It was late in coming to maturity, and this

circumstance had first led many to think that it was never coming at all. Then a too sanguine view was taken of it. Finally, when it was damaged by cloudy weather, the damage was immensely exaggerated. The Superintendent of Land Records estimates that it was an 8-anna crop. I believe myself that this estimate is pitched too low. Any how there can be no doubt that the crops has proved a great boon to the poorer classes. But no substantial improvement in the situation can be looked for till the rains have been established and the earlier food crops have been gathered."

The Deputy Commissioner of Damoh observes that the *mohwa* crop was a very fair one and has proved a useful addition to the food supply of the people. Moreover, the extensive measures of relief which have now been in operation for some time past have done much to diminish distress. The failure of crops in this district has however been more severe and less redeemed by local exceptions than in other districts, and the resources of all classes, malguzars and tenants alike, have been almost entirely exhausted. There is a universal demand for loans for cattle and seed grain, and, without extensive help of this kind, the recovery by the district of anything like its former prosperity will be impossible. The result of my recent visit to Damoh leads me to agree in this view of the situation there. Damoh seems to me to be more exhausted and impoverished than any other district in the division and in this opinion I find that experienced residents of Jubbulpore, who are acquainted with the circumstances of the other four districts, agree.

The *rabi* harvest here was, with the exception of a few isolated villages, very poor, and no real improvement in the situation can be expected until the autumn crops are reaped.

In Mandla there has been no change in the situation as reported last month, *mohwa* is not important here and affords no extensive relief.

In Seoni the *mohwa* crop, though considerably damaged by cloudy weather, has given perceptible relief. Ploughing for the early sowings is in active progress, and it is reported that 3-5ths of the normal *kharif* area have already been ploughed. The great need now in all districts is either seed for the June sowings or money to buy seed. The only seed grain of which a real deficiency of stock is reported, is *kodo* and *kutki* of which the crop last autumn was very scanty; which is sown by the poorest agriculturists and which has, in consequence, been largely eaten by them for food. Great efforts have been made by the Deputy Commissioner of Mandla to obtain this seed which is very largely sown in his district. Letters have been written to all districts where such crops are grown and agents have been sent out to the adjacent Native States to attempt to effect purchases. So far, however, no stocks have been met with and there seems some reason to fear that the full area usually occupied by this crop may not be sown. But it is not impossible that, even now, small stocks are being kept back, either in view of urgent personal necessity at sowing time or in anticipation of an even higher price being obtainable as the monsoon approaches, several cultivators whom I questioned on the relief works in Mandla, at first entirely denied having any stock of seed laid by, but further and more detailed enquiry showed that they had in reality laid by some little store. This may be the case in many instances. Except as regards these lesser millets the demand is not for seed but for the money to purchase seed and plough cattle. For this purpose the Chief Commissioner has placed five lakhs of rupees at my disposal for allotment for agricultural loans.

This has been distributed as follows :—

	Rs.
Jubbulpore	1,50,000
Saugor	50,000
Damoh	2,00,000
Mandla	60,000
Seoni	30,000

These amounts will be largely supplemented by grants made to necessitous cultivators from the Indian Famine Charitable Relief Fund, and it is hoped that with this liberal aid from these two sources, a considerable area of *kharif* land may be sown and the cattle purchased which are necessary for ploughing it.

Careful instructions were issued early in April as to the methods to be followed in maturing proposals for the suspension or remission of the *rabi* land revenue instalment. For Damoh and Seoni detailed proposals were submitted during the month. In Damoh the whole of the *rabi* instalment except Rs. 15,607 has been remitted while in Seoni Rs. 38,270 have been suspended out of a demand of Rs. 1,16,752.

In the other districts the detailed examination of the statistics of each village which has been ordered has entailed delay. But it is hoped that the proposals will be submitted and sanctioned within the next week or so.

10. *Changes in the rate of wages.*

In Saugor the rate of wages was raised during the month, the basis of calculation being a rate of 8½ seers per rupee for the staple food grain. In Damoh wages are still fixed on a basis of 10 seers for the rupee which is now too low. The Deputy Commissioner is being written to on the subject. In other districts there has been no change in the rate of wages and none is called for at present.

11. *Railway work.*

The numbers employed on the Saugor-Katni extension of the Indian Midland Railway at the end of March and April respectively are shown below :—

—	27th March.	24th April.
Jubbulpore	3,935	3,921
Saugor	7,238	7,561
Damoh	12,214	13,090
TOTAL ...	23,387	24,572

12. *General remarks for the division.*

(*a*) *Situation with regard to famine.*—The following is a comparison of numbers in receipt of the aggregate Government relief at the end of March and April respectively :—

Name of relief.	27th March. Numbers relieved.	24th April. Numbers relieved.
(A) WORKS.		
1. Public Works Department	100,044	95,663
2. Under Civil Officers	52,310	56,497
	152,354	152,160
(B) GRATUITOUS RELIEF.		
1. In poor-houses	7,817	8,181
2. Other gratuitous relief including that of dependants on works	57,442	60,724
	65,259	68,905
	217,613	221,065

The increase in the total number has not been so great as I had anticipated. This is partly due to the numbers on Public Works Department works in Saugor having previously been considerably overstated, but is also to be ascribed to the gathering of *mohwa* which has taken away some thousands from the works into the forests, and also to outbreaks of cholera which generally lead to a stampede and to the very rapid diminution of numbers on any work where the disease breaks out with any violence. The fluctuation under the several other heads has already been discussed in the earlier part of this report.

(*b*) *Measures taken to organise and complete measures of relief.*—It was remarked in last month's report that the arrangements for famine relief in this division may now be considered as complete, all that is necessary being constant and rigid supervision, and prompt arrangements to meet any local distress. During the month active preparations were being made for securing effective relief during the monsoon months. Schemes of relief for Mandla, Seoni, and Jubbulpore were decided on. Office buildings and workers' huts are being built or improved so as to give adequate shelter from rain and the poor-houses are being improved and partly reconstructed so that the weakly inmates may not suffer when the monsoon sets in. Moreover, special arrangements have, as already noticed, been made for the supply of food during that season in the Mandla district.

(*c*) *Prospects of the division as regards the scarcity.*—Under this head I can only repeat, with one slight alteration, what I wrote last month :—

"The *rabi* crops having been gathered in, no marked change in the situation can be anticipated at present. Numbers will probably increase during the current month and increasing exhaustion of stocks in *kharif* areas must make distress more acute. The gathering of the *mohwa* crop has formed a most useful addition to the food supplies of the people and, especially in remote tracts, should improve the general health and tend to diminish the death-rate."

I would add, however, that the increasing heat will make adequate shelter more necessary, will tell on the old and weakly, and will probably also raise the death-rate.

Nagpur Division.

1. *Private Relief.*

Balaghat.—Subscriptions are collected for the Balaghat, Katangi and Baihar poor-houses. Rs. 299 were spent during the month on the Balaghat poor-house from subscriptions, the balance from Government funds. There are no private institutions. In Baihar 20 or 30 orphans are being maintained by the Revd. J. Lampard.

Bhandara.—The Charitable Relief Committee is now in fair working order. There have been no changes. Detailed reports and accounts are submitted direct to the Committee at Nagpur.

Chanda.—The subscriptions amount to Rs. 2,495-4-2 and are to be devoted principally to the relief of destitute tenants. Nothing has yet been spent. The method of expenditure is under consideration.

Nagpur.—A new poor-house has been opened at Umrer. The District Charitable Committee are doing good work. Relief is afforded to destitute families and to the needy, selected by the Committee. Experimental measures have been started for assisting the weavers of Nagpur, selection has been made of fit recipients for the money given for seed and subsistence.

2. *Poor-house relief.*

Balaghat.—No new houses opened. The number of men, women and children in the three poor-houses now in existence was 1,041 in April, against 1,634 in March. The decrease is said to be due to a number having been sent away to relief works, to several going away to pick *mohwa*, and to the institution of village relief.

Bhandara.—The poor-houses remain the same. There was a slight increase in numbers, most noticeable at Gondia.

Nagpur.—A considerable reduction in numbers is reported in the Nagpur poor-house owing to stricter enforcement of the code ration, but great care is taken to avoid severity. The outbreak of cholera at Chorbaoli led to a sudden increase in the numbers at the Kamptee poor-house, which, however, is now being closed, as the inmates can be more economically provided for in the Nagpur poor-house.

3. *Village Relief.*

Balaghat.—There are 86 persons gratuitously relieved, and 10 on light labour in the four relief centres at Lalbarra, Hatta, Kirnapur and Baila. There is an increase in the number of persons relieved at their homes, owing, it is reported, to all villages being now under supervision. It is thought the numbers will rise still higher. All the Kotwals in the ryotwari and a large number of those in the malguzari area are in receipt of relief.

Bhandara.—Twelve Revenue Inspectors are engaged in the work. The number relieved has largely increased. Children's kitchens, it is said, continue to do good work, and starving wanderers are relieved by the Police, and sent to poor-houses or relief works.

Chanda.—The Deputy Commissioner writes: "The village gratuitous relief started in the Courts of Wards estates is not shown as a famine charge. The number receiving relief is 49 and their condition is satisfactory."

4. *Relief Works.*

Balaghat.—There are three roads and five tanks on which work is going on, giving employment to 43,427 people. Of these five tanks, two are new (the Saregaon and Alua) and are under the Public Works Department, in the Baihar Tahsil, for ryotwari villages. On two of the roads the camps become unmanageably large, so a third camp had to be started on each road.

Bhandara.—No new works opened during the month. The number of labourers on the works in existence rose from 10,763 to 11,173. In addition to the above, 1,851 persons were relieved gratuitously. There was a steady decrease in numbers since last month up to the week ending 24th April, when there was a sudden rise. This was owing to the *mohwa* season which is now practically over, and a considerable rise is expected during the current month.

Chanda.—The only works taken in hand consist of repairs to 212 tanks, started partly with the aid of Famine loans and of loans under the L. I. Loans Act aggregating Rs. 17,565. Including ryotwari, malguzari and zamindari tanks, it would appear that 11,304 men, women and children were employed on tank work on the last Saturday of the month, but no very precise details have been given.

Nagpur.—Full details are given in Statement D attached to the District Return. A new camp opened at Metpanjra, at the beginning of the month employs now about 2,500 people. The camp at Chorbaoli increased very rapidly to 6,000 and was shifted in consequence of cholera to Mansur. The camps round Nagpur are said to be in very good order. I have seen them all and can confirm this opinion. The piece-work system which worked well at Telinkheri is being extended. The camp at Umrer remains small, owing, the Deputy Commissioner thinks, to the large amount of *taccavi* given in this tahsil. Rs. 30,000 were distributed in famine loans, as per details in statement DI, but no particulars have been given as to the number of works being carried out with the aid of these loans. Most of them are however in the Umrer Tahsil.

Wardha.—Work has just started (24th April 1897) in this district on the Arvi Ashti road. Writing on the 7th May the Deputy Commissioner states the numbers have gone up to 4,700. It has been arranged for the work to be done on the piece-work system.

5. *Physical condition of the people.*

Balaghat.—As regards those in receipt of gratuitous relief the Deputy Commissioner writes : "These are of course the worst people who have stuck to their villages and refused to leave. Some of the people I have seen have become terribly emaciated." Those "on works" are said to be in good condition, and there were no cases of emaciation amongst those in "distressed tracts." Cases of emaciation are becoming comparatively rare, owing to the village relief system.

Bhandara.—In the Powni Chauras, and Haveli and a portion of the Sakoli Tahsil, the condition of the people is said to be normal, but the Koshtis and other artizans of Powni are reported to be "hard up." The condition of the people on relief works is good as also of those in receipt of village relief. There were cases of emaciation in poor-houses, especially at Gondia.

Chanda.—The condition of the people as a whole is satisfactory, and the Deputy Commissioner reports that he has not come across any cases of emaciation caused by starvation.

Nagpur.—The general condition of inmates of the poor-house is said to be good, and of those on works "very fair." I noticed, however, a few cases of emaciation in the poor-house at a recent visit, but they were almost invariably found to be wanderers from Balaghat and Bhandara. Male weavers, it is reported, at all camps look pulled down, and never approach a D task. Their women and children however look well. Cases of emaciation at all camps are very few, and even these are chiefly people who travelled very long distances in search of work. In distressed tracts visited by the Deputy Commissioner no cases of emaciation were found—great relief is said to have been experienced during the month from the *mohwa* and *char* produce. It is reported that many have stored up *mohwa* for consumption during the rains.

Wardha.—As work has only just started in this district, it would be well, perhaps, to quote the Deputy Commissioner's own words—"fairly good on the work, said to be deteriorating in the affected area, cases of emaciation are noticeable among the poorer classes in that area. Relief works are necessary for them." I am writing to the Deputy Commissioner on the subject.

6. *State of crime.*

Balaghat.—Reported to be much the same and offences against property above normal.

Bhandara.—Some increase in petty thefts and cattle lifting, but no cases of serious crime.

Chanda.—Increase throughout the district, principally thefts of small value.

Nagpur.—A note by the District Superintendent of Police gives details. Compared generally with last year there is an increase, due, it is said, to high prices. Compared with last month (March) there is a decrease in thefts owing to grain being better guarded.

Wardha.—No remarks.

7. *Deaths from Starvation.*

Balaghat.—Details will be found in the mortality return attached. 13 deaths are reported against 48 in last month. The deaths in poor-houses are all said to be due to debility caused by privation.

Bhandara.—The deaths shown in column 16 of District Statement A relate to the preceding month, March. The special mortality return for this District for April prescribed by Secretariat letter No. 1400, dated 31st March last, has been received this day, and it shows deaths from starvation at 16, 7 in towns, and 9 wanderers found dead on or near lines of traffic.

Chanda.—One death is reported in the Warora Dispensary, but enquiry as to its real cause is being made.

Nagpur.—Statement E attached shows 7 deaths from starvation outside the poor-houses, and a reduction of 15 compared with the previous month, said to be due probably to the *mohwa* crop. Four deaths all of one family are reported from the Nagpur poor-house. Two deaths from diarrhœa and two from dysentery at the Kamptee poor-house are attributed to privation.

Wardha.—The special mortality returns for this district for April have been this day received. The figure as entered in column 16 of District Statement A, has apparently been taken from the above return. Of the 10 deaths from starvation three were in towns, and seven were wanderers. It should, however, be noted that while the special mortality return is for the whole month of April, the Deputy Commissioner's Statement A embraces the period 28th March to 24th April.

8. *Changes in rates of wages.*

Balaghat.—A rise is reported from 8 to 7½ seers in Balaghat and 7 in Baihar and is expected to be much higher during the rains.

Bhandara.—Wages were paid at the rate of 9 seers, but since then sanction has been accorded to payments being made at both camps on the Gondia-Arjuni road at the 8-seer rate.

Chanda.—No information has been furnished.

Nagpur.—Wages at Mansur are paid on the 8-seer basis, which will remain the same, until the cholera scare abates. The Deputy Commissioner promises to submit a separate report on this subject.

Wardha.—No changes. Basis of wages 9½ seers per rupee.

9. *Foodstocks.*

Balaghat.—Reported as depending now entirely on imports. Transport is becoming a difficulty.

Bhandara.—Fairly sufficient, but a contract for the supply of grain for one relief work has had to be given.

Chanda.—Food supply adequate.

Nagpur.—Ample, but grain, especially *juari*, does not come readily to the market.

Wardha.—Sufficient, *rabi* seed stock, the Deputy Commissioner reports, is insufficient and causing some anxiety.

10. *Imports and exports.*

Balaghat.—The Deputy Commissioner considers this the most serious question in his district. He is endeavouring to place Rs. 60,000 seed grain in Baihar before the rains.

Bhandara.—From the weekly statements it would appear that grain stocks within the district are becoming exhausted, but, notwithstanding this, the Deputy Commissioner is of opinion that private enterprise will not fail in replenishing the stock.

Chanda.—800 maunds of grain were imported and 5,000 exported.

Nagpur.—A statement L is attached giving details. 59,895 maunds of grain were imported, and 22,199 exported by rail during the month, the latter chiefly to Jubbulpore, Amraoti, Khamgaon, Bhusawal, Murtuzapur, etc. The imports and exports by road were 62,876 and 7,032 maunds respectively.

Wardha.—The imports and exports were 10,000 and 1,600 maunds respectively.

11. *General condition and prospects.*

Practically much the same as last month, the remarks of the Deputy Commissioner, Bhandara, "the prospects of the future depend on a timely monsoon, and the provision of sufficient seed grain to enable something like the normal area to be sown," may be held to apply generally to all districts. From Chanda it is reported that there is no actual distress, but that privation and scarcity exist, owing to the very high price of food grains. In Balaghat over a lakh and three-quarters has been given for seed grain *taccavi*, and if all this is procurable, it is expected that three-fourths of the cultivated area will be sown. The Deputy Commissioner observes that a good monsoon is absolutely necessary to save the District.

No. 536-C, dated the 14th May 1897.

From L. K. Laurie, Esq., I.C.S., Commissioner, Nerbudda Division, to the Chief Secretary to the Chief Commissioner, Central Provinces.

I have the honor to forward herewith consolidated statements A and B, for the districts of this division for the four weeks ending Saturday the 24th April. I also send the district officers' notes and the prescribed memorandum. The delay in the submission of this report is due to the Nimar returns having only come to hand to-day

2. The following abstract compares the number of persons employed on relief works as now reported with the number shown in last month's statement :—

District.	No. of workers on 24th March.	No. of workers on 24th April.	Difference.
Hoshangabad	46,256	38,524	—7,732
Narsinghpur	36,040	22,770	—13,270
Betul	8,648	8,019	—629
Chindwara	8,214	12,449	+ 4,235
Nimar	78	139	+ 61
Total	99,236	81,901	—17,335

The increase in Nimar is trifling and may be disregarded. The increase in Chindwara is partly due to the opening of a new camp at Delakhari on the Matkuli-Chindwara road to which workers from two camps on the Piparia-Pachmarhi road and were transferred. This transfer accounts for the decrease in Hoshangabad.

In Narsinghpur the falling-off in numbers is caused by the flight of workers (including many immigrants from Bhopal) from the Birman-Tendukhera, Saugor-Kareli, Gadarwara-Sainkhera and Narsinghpur-Lakhmadon roads, under the influence of panic caused by the appearance of cholera. Cholera also showed itself on two of the works in the Betul District and checked the increase in numbers there.

The gathering of the *mohwa* crop withdrew many persons from the works in the first fortnight of April. But in the latter part of the same month most of those who had absented themselves for this purpose returned to the relief camp: and the figures for the week ending May 1st show that in Hoshangabad and Betul the ground lost has been recovered, while in Chindwara there has been a further increase.

3. The figures for dependants and non-working children show a decrease of about 30 per cent. (as compared with a decrease of about 17 per cent. in the number of works) :—

District.	No of dependants on 27th March.	No. of dependants on 24th April.	Differences.
Hoshangabad	9,967	8,589	—1,378
Narsinghpur	8,215	2,952	—5,263
Betul	837	1,317	+ 480
Chindwara	1,375	1,418	+ 43
Nimar	14	38	+ 24
Total	20,408	14,314	—6,094

The greatest decrease occurred in Narsinghpur where the number of dependants was proportionately highest and where cholera, as has been stated, caused a panic. The result is that in that district the percentage of dependants has fallen from 23 to 10 per cent. and the divisional percentage has gone down from 20½ to about 18 per cent. The highest percentage is in Hoshangabad where the figure is 22, or about the same as last month.

4. The poor-house population shows a decrease of 203 due chiefly to the reduction in numbers in the Narsighpur District. The number of deaths in the poor-house at the head-quarters of that district was 114 :—

District.	No. of inmates on 27th March.	Poor-houses on the 24th April.	Difference.
Hoshangabad	770	830	+ 60
Narsinghpur	1,819	1,546	—273
Betul	308	289	— 19
Chindwara	270	274	+ 4
Nimar	136	161	+ 25
Total	3,303	3,100	—203

5. The number of persons fed at Police Stations and at relief kitchens on road works has not been reported for the Hoshangabad and Chindwara Districts. For other Districts the details are as under—

Narsinghpur	350
Betul	16
Nimar	23

6. The statistics of village relief are as under :—

District.	Numbers Relieved on.		Difference.
	27th March.	24th April.	
Hoshangabad	403	1,637	+1,234
Narsinghpur	378	429	+ 51
Betul	1,104	1,375	+ 271
Chindwara	*1,589	1,603	+ 14
Nimar	81	127	+ 46
Total	3,555	5,171	+1,616

* Including persons (1,388) relieved at "distributing centres" in jagirs.

There has thus been a general increase in the numbers relieved, the rise being most marked in the Hoshangabad District where a considerable amount of pains has been taken to ensure that the village registers contain the names of all persons who are really in need. With the completion of the harvest many cripples who earned a livelihood as watchmen, &c., were left without resources, and their names have now been brought on the lists. The number of persons in receipt of village relief in the Narsinghpur District is still disproportionately small, and I have applied for the services of a special officer to assist in checking the registers.

7. The death rate was excessively high in the Narsinghpur District, where, according to a telegram from the Civil Surgeon, the deaths in April amounted to 3,004. Details are as under—

Fever	1,003	deaths.
Bowel complaints	327	,,
Cholera	1,322	,,
Small pox	16	,,
Starvation	4	,,
Other causes	332	,,

More than half the mortality was thus due to cholera and bowel complaints

The death rate was also high (51·6 per mille per annum) in the Betul District owing to a sharp outbreak of cholera which occurred at the relief camp at Kheri. Coolies running away to their homes from the camp spread the disease to other villages. The above rate is taken from the Civil Surgeon's monthly return, as the Deputy Commissioner has given the figures for March only. The same return shows the deaths from starvation as 6. The mortality was less than in March and was only slightly in advance (1,391 deaths as compared with 1,344) of the mortality in April 1896.

Next in order comes Nimar with a death rate of 45·6. The mortality in April was 1,109. There were 55 deaths from cholera. The Civil Surgeon's telegram from which this information is taken does not give the deaths from starvation. The Deputy Commissioner's figure (16) is for March. In Hoshangabad the death-rate for April is 35·1 per mille per annum. The figures given by the Deputy Commissioner and by the Civil Surgeon correspond. The mortality in the corresponding month of 1896 was higher, being at the rate of 41·7 per mille per annum. The analysis made by the Civil Surgeon shows that in two circles the Singanama and Kesla outpost circles, the death-rate was as high as 111·9 per 1,000 and 82·8 per 1,000 respectively. The population in these circles consists largely of Gonds, and Dr. Price is of opinion that the excessive mortality is due partly to fever and partly to diarrhœa caused by consuming undried *mohwa* in the absence of more wholesome food. In both these circles there is a relief work and village relief. Deaths from starvation number 81, of these 27 deaths occurred in the Timurni station house circle, and 16 in the Bankheri

station house circle. Enquiry is being made as to the reason why these circles show so badly in this respect. The Deputy Commissioner notes that he is sceptical as to the accuracy of the figures.

Passing to the Chindwara return I find that the Deputy Commissioner has given the figures for March only. The Civil Surgeon's return for April shows 915 deaths which on a population of 407,000 gives a rate of 26·4 only per mille per annum. Deaths from starvation numbered 28.

8. The number of relief camps or charges under the management of the Public Works Department which were open during the month was as under.

District.	Number of charges.	Names of works.	Increase or decrease.
Hoshangabad	8	1. Babai-Bagra road	— 1
		2. Itarsi-Dhar road...	
		3 & 4. Harda-Dekha road (2 charges) ...	
		5 Semri-Barkach road	
		6. Hotwas-Bankheri road...	
		7. Bankheri-Dudhi road	
		8. Semra-Sohagpur „	
Narsinghpur...	6	1. Gadarwara-Samikhera road	+ 1
		2. Birmham-Tendukhora road	
		3. Narsinghpur-Leakhnadon road ...	
		4. Narsinghpur-Sankal road	
		5. Old Bombay road (at Kareli)	
		6. Narsinghpur-Chindwara road... ...	
Betul	3	1. Shapur-Dhar road	...
		2. Betul Ellichpur road	
		3. Badnur-Hurda road	
Chindwara	3	1, 2. Matkuli-Chindwara road	+ 1
		3. Chhindwara-Narsinghpur road ...	
Nimar	1	1. Khandwa-Mohghat road	...
	21		+ 1

In the Hoshangabad District two charges (Pagara and Matkuli) were transferred to the Chindwara District, the workers being distributed between two camps on the Matkuli-Chindwara road (one of these being a new one). The Harda-Handia road was completed and the workers formed into a second charge on the Harda-Dhekna road. A new charge was opened at Semri, on the Bombay road. The work at Panari (on the Pachmarhi road) was transferred to Bankheri and the work at Bagdeo (on the Itarsi-Dhar road) to Kesla. The Piparia Sandia charge moved on to the Bombay road, at Hatvas.

In Narsinghpur work on the Saugor-Kareli road was closed and two new works were opened—one on the Bombay road at Kareli and one on the Narsinghpur-Chindwara road.

In Betul and Nimar there was no change. In Chindwara one more charge was opened at Delakhari on the Matkuli-Chindwara road. The net result

is an increase of one charge, the total number of charges under the Public Works Department standing at 21.

Of charges under Civil Officers there were the following :—

Hoshangabad District.	(1) A village work (tank) at Sobhapur.
	(2) A small work (improvement of public garden) at Hoshangabad.
Chindwara District.	(3) Mureth-Bhatoria road.
	(4) Tamia tank (from Court of Wards funds).
	Of works being constructed by *jagirdars* and *malguzars* with the aid of Famine loans, there were the following :—
	Harrai tank.
	Dhanora tank.
	Gorpani tank.
	Small local works in the Narsinghpur and Betul Districts (number not specified).
Nimar District.	Punasa tank.

9. Turning now to the subject of General Orders issued during the month with a view to the alleviation of distress or to the more complete organization of existing measures of relief, I may note that proposals were submitted with this office letters No. 3544, dated 2nd April, and 460-C, dated 26th idem, for the suspension of part of the June instalment of Land Revenue in the Hoshangabad District and of the whole of the June instalment in the Narsinghpur District. These proposals were sanctioned in your letters No. 580-C, dated 9th April and 774-C, dated 3rd May. In Revenue Department letter No. C-648, dated 16th April, sanction was accorded to the appointment of three additional *tahsildars* in the Hoshangabad District and one each in the districts of Chindwara and Betul. For the Narsinghpur District two additional *tahsildars* had been previously sanctioned. In Revenue Department letter No. 715-C, dated 24th April, the appointment of eight additional revenue inspectors was sanctioned. The aim of these appointments was to increase the staff available for supervising village relief and the distribution of *taccavi* advances.

In my letter No. 363-C, dated 8th April, I called the attention of all Deputy Commissioners to the need for studying the question of the supply of seed grain to cultivators. I am glad to state that the replies received give satisfactory assurance on the subject of the stocks available to meet the demand for sowing purposes : and it will not, it seems, be necessary to take any special steps in the matter. In Revenue Department letter No. 601-C, dated 12th April, the Chief Commissioner informed me that the rate of interest on seed grain advances to *malguzars* engaging to supply their tenants with grain might be reduced from 6¼ to 5 per cent., and this concession has since been extended at my request to *patels* in *ryotwari* villages (Revenue Department letter No. 789-C, dated 5th instant).

In my circular letter No. 410 C, dated 13th April, the attention of all district officers was drawn to the need of carefully revising the village registers of poor in view of the fact that with the close of the *rabi* harvest many infirm persons who had earned a subsistence in watching crops would be thrown out of employment.

10. Food stocks are said to be sufficient except in the Betul District, where, however, the import trade will, it is anticipated, meet all requirements. Prices are slowly rising. The effect of the gathering of the *mohwa* crop on the numbers on relief works was transient and brief. Had it not been for cholera, the numbers on relief works would probably by this time have regained the total of last month. The ploughing season is now commencing and a small proportion of the workers will be drawn off thereby. There has been some delay in carrying out the census of cultivators referred to in last month's report owing to Deputy Commissioner's being in camp when the Secretariat orders were received : and it is not therefore possible to hazard a guess as to the number of persons who will go off to the

ploughing. I incline to the belief that by the end of May, if cholera is not very prevalent, the numbers on relief works in this division will once again exceed 90,000 and may touch 100,000.

Nerbudda Division.

1. *Private Relief.*

Narsinghpur.—The total number of persons relieved by private charity in this district during the month of April was 66 at a cost of Rs. 99-15-3. Rai Bahadur Seth Tikaram continued to feed the needy persons in the town of Narsinghpur. There are not private institutions for famine relief in the district. The money allotted to this district by the Provincial Charitable Relief Fund Committee will very likely be distributed to the really destitute tenants in the current month, for seed grain and plough cattle.

Chindwara.—The gratuitous relief dispensed by private persons in the town of Chindwara was stopped at the beginning of the month for want of funds. The Municipal Committee were thereupon called on to submit a list of persons entitled to government relief under section 34 of the Famine Code.

This list was submitted on the 24th of April and was approved of by me.

In future, therefore, the relief will be administered from Government funds.

Betul.—No subscription was raised in the district for private relief during the month.

Out of the amount previously raised Rs. 410-5-3 were spent in the relief of persons in municipal towns and 255 persons were to be relieved compared with 106 persons in the previous month.

Nimar.—Rs. 190 subscribed by private persons was distributed in relief at a "kitchen" by a committee. Private funds are now exhausted.

2. *Poor-House Relief.*

Hoshangabad.—The poor-houses at Hoshangabad and Sohagpur remained open during the month and a third was opened at Harda. The number of inmates has risen from 770 on the 27th March to 830 on the 24th April. The condition of the older inmates has been on the whole fair, but the new comers have generally been in very poor condition. In the Hoshangabad poor-house there were 66 deaths during the month on an average population of 414, and at Sohagpur 17 deaths on a population of 419, and at Harda 7 deaths on a population of 75. The high death-rate was due to a sudden outbreak of diarrhœa brought on by the use of new wheat for food.

Narsinghpur.—There were as before three Government poor-houses at Narsinghpur, Gadarwara and Chindwara. The number of inmates on the date of the report (*i.e.*, 24th April 1897) in each of these institutions was respectively 676,684 and 186 being an aggregate of 1,546. On the last day of the preceding month the numbers were: Narsinghpur, 944, Gadarwara, 727, and Chindwara, 148 —total 1,819.

Chindwara.—The number of poor-houses remains the same and there has been little change in the numbers of inmates. On the 24th April the numbers in the Chindwara and Amarwara poor-houses were 160 and 114 respectively, the corresponding figures at the close of last month being 160 and 109. The majority of persons admitted are wanderers from other districts and from the *jaghirs.*

Betul.—The one poor-house in this district is situated at Badnur and the number of inmates on May 5th was 277 as compared with 296 on April 5th.

Nimar.—There are poor-houses at Khandwa and Burhanpur. Number of inmates at close of April was 161 against 136 at close of March.

3. *Village Relief.*

Hoshangabad.—The organisation of village relief has been thoroughly overhauled and greater relief given. Mr. Toulmin in Sohagpur, Mr. Greany in Harda and Seoni, and Lieutenant Moore in Hoshangabad, have all orders to pay special attention to this branch of relief. At the close of the month 1,637 persons were in receipt of relief in their homes. All the lists have not yet been thoroughly checked and the number requiring relief in this form will probably rise still higher. The police during the month sent 241 persons to the poor-houses and 245 persons to the relief works.

Narsinghpur.—There were 21 relief centres at the police station houses and outposts. The number gratuitously relieved at these centres on the last day of the period under report was 350, as compared with 213 in the preceding month. No regular works were open at any of these centres. The number of persons relieved in their homes was 429, as compared with 378 in the previous month.

Chindwara.—The number of persons to whom relief was given at the 15 distributing centres (situated in the *jagirdaris*) increased from 1,388 on the 27th March to 1,398 on the 24th April.

The number of persons relieved in their homes was 205 as compared with 201 in the previous month. This form of relief has now been extended to the Mureth Revenue Inspector's circle in the Chindwara Tahsil and on the last day of the month under report was started in each municipal town of the district.

Betul.—16 persons were fed at four "relief centres." The Deputy Commissioner does not say anything about these centres, but I believe that there are kitchens at relief camps or police stations and are not regular relief centres. The number of persons on the village relief registers was 1,120 as compared with 1,104 in the previous month.

The system of the distribution of relief to persons in their homes has been described in previous reports.

Nimar.—Two new relief centres opened in the forest for the relief of Gonds and Kotwars, making three in all. Attendance on 24th April was 41.

4. *Relief Works.*

Hoshangabad.—The scheme of relief works under the Public Works Department was considerably altered at the beginning of the month owing to completion of works and the necessity of removing the workers off the Pachmarhi Road.

Two charges with a total of 7,226 persons passed out of the district into Chindwara. The Piparia-Sandia charge moved on to the old Bombay Road at Hatwas and the Panari charge to Bankheri.

The charge on the Semri-Bharkoch Road had grown so large that half of it was formed into a new charge on the Semri-Sohagpur section of the old Bombay Road.

Babai-Bagra charge remained unaltered.

There were thus five charges during the month under the Public Works Department *East of the Tawa* and there was also a small village work at Sobhapur.

In the Hoshangabad Tahsil, west of the Tawa, work continued on the Itarsi-Betul Road, but the camp was moved to Kesla.

There was also a small village work at Hoshangabad itself.

In the Seoni Tahsil there were no works, but the Harda-Timarni-Dhekna Road with two charges on it met any demand for work that arose both in Seoni and Harda.

The work on the Harda-Handia Road was finished.

Owing to the plentiful crop of *mohwa* and the supply of food thus afforded the numbers fell off rapidly during the first fortnight of the month, the lowest total reached being 41,494 on 10th April.

For about a week there was no increase in numbers, but during the last week of the month there was a large influx of labourers, the total on the 24th April being 47,113 as against 56,223 on the 27th March.

As I am unable to say how many people of the two charges which left the district have come back to works nearer their homes, it is difficult to compare the figures.

Narsinghpur.—In the second week of April two works were opened, one on the old Bombay Road (Narsinghpur and Kareli) and the other on the Narsinghpur-Chindwara Road. In the third week the Saugor-Kareli road work was closed. So there were only six large works at the end of the period under report, all being in charge of the Public Works Department.

(*a*) Construction of the Gadarwara-Sainkhera Road earth-work—number on last day of the month 5,118, as compared with 9,096 of the previous month. The numbers dropped rapidly during the last few days of the month in consequence of an outbreak of cholera. The latest report showed only about 100 people on the works, so a move to Berha and Gadarwara is contemplated.

(*b*) Metalling of the Barmhan-Tendukhera Road (stone-breaking)—number on last day of the month 6,720 as compared with 13,553 of the previous month.

Nearly all the Bhopal people on these works (*a*) and (*b*) have gone away.

(*c*) Metalling of the Narsinghpur-Lakhnadon Road (stone-breaking)—number on last day of the month 748 as compared with 3,090 of the preceding month.

(*d*) Construction of the old Bombay Road (Narsinghpur-Kareli)—number on last day of the month 2,692.

(*e*) Construction of the Narsinghpur Sankal Road (earth-work)—number on last day of the month 5,082 as compared with 6,079 of the previous month.

(*f*) Construction of the Narsinghpur-Chindwara Road (earth-work)—number on last day of the month 2,410.

Relief kitchens have been started on four works. Famine loans to the extent of Rs. 500 were advanced to the cultivators during the month under report. Local works are under construction and 468 persons in all were employed on the last day of the period under reference.

Chindwara.—One more charge has been started on the Belgaon-Singanama Road at Delakhari, but otherwise the relief works on the charge of Public Works Department remain unchanged.

The following statement shows the variations in the numbers on each work as compared with last month's figures :—

Name of Work.	Number on 27th March.	Number on 24th April.
Construction of the Chindwara-Narsinghpur Road	4,040	4,852
Metalling of the Mutkuli-Belgaon Road	1,584	3,351

The increase is due partly to the introduction of a new charge at Delakhar on the Mutkuli-Belgaon Road and partly to people returning to the works after the gathering of the *mohwa* crop.

Small works (columns 5 and 7 of Statement B) are the same as for last month. The numbers on the Mureth-Bhatoria Road increased from 1,311 on the 27th March, to 1,400 on the 24th April. The numbers on the Harrai and Tamia tank, were 1,393 and 467 respectively, as compared with 930 and 349 at the close of March, and on the 24th of April there were 986 persons employed on the tank being constructed by the *jagirdar* of Sonpur at Dhanora. The numbers on the Bhatoria Road underwent great fluctuations during the month owing to *mohwa* collection, the numbers falling as low as 98 on the 3rd of April. They have now returned to the former figure. A tank was begun at the close of the month at Gorpani by the *jagirdar* who took a loan of Rs. 2,000 for the purpose, but no returns had been received from the work for the 24th of April.

Betul.—The large works open during the month were—

(1) Stone-breaking on the Itarsi Road near Shahpur.

(2) Earth-work on the Badnur-Ellichpur Road near Kheri.

(3) Earth-work on the Badur-Harda Road near Chicholi. During the month work (2) was moved at a distance of 6 or 7 miles. Owing to an outbreak of cholera in the camp, this measure was successful in stopping the disease among the workers. The numbers were as follows :—

	On the last day of present month.	On the last day of previous month.
On work (1)	2,682	3,585
On work (2)	3,222	3,759
On work (3)	3,432	1,304
	9,336	8,648

The decrease on work (1) is due to numbers of labourers having left in order to pick up *mohwa* in the jungle.

The increase on work (3) is due to the return of persons who had left the work owing to an outbreak of cholera. No large works were opened during the month.

No local works were opened. Rs. 6,605 have been advanced as famine loans, mostly to the cultivators and cultivating *malguzars* for the construction of wells and small embankments. No figures are available as to the number of persons on such works.

Nimar.—There is only one relief work and the numbers employed on it are small (139 as against 78 at close of March).

5. *Physical condition of the people.*

Hoshangabad.—On the whole the condition of the workers, except in the hill tracts round Kesla, is fair, and I noticed few cases of emaciation. Only 48 deaths occurred during the month on relief works.

Narsinghpur.—The general condition of the people on the works is good, except on the Barmhan Tendukhera work. This work has suffered severely from cholera and many people ran away from it although they had very little to fall back upon for their maintenance. The general physical condition could not be said to be very reduced.

Chindwara.—During the month the Deputy Commissioner inspected all relief works in the district, except that on the Bhatoria-Mureth Road and visited 14 out of the 15 distributing centres in the *jaghirs*.

The absence of village starvelings, even in the most distressed parts, was very satisfactory. There were of course certain number of emaciated persons at the centres, but the object of these institutions appears now to be understood, and starving skeletons are no longer to be found hanging about the out-skirts of villages. The *mohwa* crop has turned out better than was at first anticipated and has done much to ameliorate the condition of the people. The health of relief workers is good and the majority of workers are robust and strong.

Nimar.—The physical condition of the people is generally fair.

6. *Deaths from starvation.*

Hoshangabad.—There was a slight outbreak of cholera at Hoshangabad and another in the South-west of the district near Damipura, and a few cases of small pox. The death-rate per 1,000 for the whole district during April was 35·1, which is moderate.

In certain outpost circles it was, I regret to say, extraordinarily high Mutkuli circle, the worst, having a death rate of 111·9, Kesla 82·8, and Hoshangabad 57·6.

The high death-rate in the first two circles is due to fever and bad food and water. There is a relief work at Kesla itself, and the relief works on the Chindwara road are close to the Mutkuli circle. No additional relief measures are required. The Hoshangabad death-rate is due to 66 deaths in the poor-house, excluding these the death rate is only 35·1 per mille. In no other circle is the death rate above 50 per mille per annum. Eighty-one deaths are reported to have been due to starvation, but up to date reports have been received verifying only 16 of these.

Of the total reported 16 are from Bankheri and 23 from Timarni, both of which circles are specially fitted out with relief works. I am sceptical about the correctness of the figures and have called for further details. 33 deaths are reported from privation, excluding deaths in the poor-houses.

Narsinghpur.—The total numbers of deaths in March 1897 as reported by the District Superintendent of Police were 25. The total number of deaths in the district during the month of March 1897, was (*a*) inclusive of towns 1,480 with a death-rate of 4·03 and (*b*) exclusive of towns 1,245 with a death-rate of 3·29.

Narsinghpur poor-house.—There were 114 deaths, or a ratio of 130·44 per thousand. Of the 114 deaths 4 were due to want of food and 75 due to illness induced by want of food.

Gadarwara poor-house.—There were 49 deaths during the month against 73 of the previous month, having a ratio of 69·35 per 1,000. Of these 8 were due to want of food and 37 due to illness induced by want of food.

Chindwara poor-house.—There were 15 deaths against 26 in the preceding month. In this poor-house there were no deaths from want of food, but 9 were due to illness induced by want of food.

The deaths reported from starvation at the relief works by hospital assistants during the month of April were 3, and in poor houses 12.

Chindwara.—Information under this head is not yet available for April. The returns for March showed 25 deaths from starvation, including 11 deaths of wanderers found dead by the road side. The police have been asked to submit a short history of each of these cases, but the probable explanation is that the deaths reported were those of immigrants who came in large numbers from Bhandara and Balaghat for the wheat harvest and were unable to find work. 27 deaths occurred in the poor houses at Amarwara and Chindwara. In 13 cases the deceased were 60 years of age and upwards.

Sixteen cases were due to diarrhœa, 6 to debility, one to dysentery, and 2 to small pox. Only 4 deaths could be attributed directly to starvation, though in most cases death was the result of living on unsuitable food. A small outbreak of cholera caused 24 deaths in the Sansar Tahsil and small pox is prevalent in the north of the district.

The death rate for March was 2·70 for the Chindwara Tahsil and 1·96 for the Sansar Tahsil, the death rate for the district being 2·47. The month was therefore apparently more healthy than was the case in 1895–96, when the district death rates were 2·51 and 4·93 respectively.

Betul.—The death rates for March were as follows :—

	Excluding Cholera and Small Pox.	
Rural Circles	73·12	63·69
Towns	43·22	...
Multai Tahsil—		
Rural Circles	39·75	38·5
Towns	34·23	...
TOTAL	58·88	52·98

The total number of deaths reported as due to starvation was 42, but on enquiry by police officers it was found that only 14 were due to this cause.

Nimar.—16 deaths have been reported by the police as due to starvation.

7. *Food stock.*

Hoshangabad.—The food stocks are sufficient, but prices are rising slowly, as there is now no local supply of food to be expected till next September.

Narsinghpur.—The food stock of the Narsinghpur District is reported to be sufficient at present.

Chindwara.—Food stock of the Chindwara District is also reported to be sufficient for the time being. There is no importation of grain worthy of remark.

Betul.—The supply of food grains in the Betul District is said to be insufficient and grain is imported from Itarsi.

Nimar.—Food stocks sufficient.

8. *Importation of grain.*

Narsinghpur.—The total imports and exports as reported in the Narsinghpur District by the station masters were 9,990 and 20,938 maunds respectively as compared with 9,299 and 31,011 maunds in the previous months. The general destination of exports is believed to be the North-Western Provinces.

Hoshangabad.—In the Hoshangabad District exports are said to have decreased still further, and only 5,186 maunds left the district during the month under report as compared with 12,460 maunds in the month previous.

Chindwara.—In Chindwara there was no importation of grain worthy of remark.

Nimar.—31,380 maunds of grain were imported.

9. *General conditions and prospects of affected area.*

Narsinghpur.—Village relief is being distributed in all the circles under revenue inspectors.

Hoshangabad.—The ploughing may take a few of the labourers and cultivators from the works, but there will be no great demand for labour until the monsoon breaks and the sowing of *kharif* crops commences.

Chindwara.—The resources of the people in the *jagirs* are said to be at a low ebb and even cultivators of the better class are depending entirely on *mohwa* for their food. The prospects depend entirely on the monsoon. If the rains set in early, cultivators will be able to raise crops of early *kutki* and *makka* which will make them independent of relief in August.

Betul.—The *mohwa* crop is now over. It has been a great help and supply of food to the poorer classes for the time.

Nimar.—There is no severe distress except in the jungly tracts.

10. *Changes in rate of wages.*

There were no changes in the rate of wages.

11. *Other matters.*

The number of offences reported during the months in Narsinghpur was 191, against 172 in the month previous, and 129 in the corresponding month of 1896.

In Chindwara petty crime is said to be decreasing owing to threshing operations. In Betul there has been no serious outbreak of crime.

CHHATTISGARH DIVISION.

1. *Private Relief.*

Raipur District.—Besides the poor-house maintained by the American Mission at Bisrampur from funds raised in America, a poor-house has been opened at Sirpur by one Kapilnath Tabutdar. 566 and 73 persons respectively were relieved in these poor-houses during April. In the Dondi Lohara Zamindari, a private kitchen is maintained by the Diwan and food is served out once a day to between 80 and 100 persons. At Dhamtari a local subscription was raised and food distributed to the poor who consist chiefly of immigrants, no distress being reported from Dhamtari itself.

Bilaspur District.—About Rs. 4,850 is reported as having been collected in local subscriptions, including about Rs. 1,650 subscribed to the Indian Famine Charitable Relief Fund.

Sambulpur District.—Local subscriptions maintain a poor-house and a kitchen at Dabhra. About 200 children are fed twice daily from the kitchen.

2. *Poor-house Relief.*

The number of poor-houses in the Raipur and Bilaspur districts remains unchanged. The number of inmates is steadily increasing. The figures for the past three months are given below :—

		February.	March.	April.
Raipur	Raipur, Baloda, Drug, Simga	1,298	1,859	2,229
Bilaspur	Bilaspur, Pendra, Mungeli, Pandaria	1,988	2,878	3,476

Looking at the figures for each poor-house separately, it is observed that in the Pendra poor-house, the number of inmates decreased from 446 in March to 395 in April. In view of the severe distress in this part of the district, the figures require an explanation which I have called for.

3. *Village Relief.*

Two more relief centres are reported to have been opened in the Raipur District bringing the total up to 23. The number relieved at these centres

was 531. Village relief and town relief were granted to 1,832 and 374 persons respectively. On the subject of relief centres, the Deputy Commissioner remarks: "The working of the relief centres has not been so successful as that of most other branches of relief." I have discussed this matter with the Deputy Commissioner, who agrees with me in thinking that with the development of other forms of relief, particularly house-to-house relief in villages, and with the more efficient and systematic discharge by the police of their duties in regard to starving wanderers, it will be possible before long to close most of the existing relief centres.

In the Bilaspur District, there is only one relief centre, *viz.*, at Pendri where 25 persons were relieved. Village relief has been granted to 9,139 persons in the Bilaspur and Mungeli Tahsils including the Pendra and Pandaria Zamindaris. This form of relief has now been considered necessary in the Seorinarayan Tahsil also, but the number requiring relief is expected to be small with the exception of the villages in one revenue inspector's circle.

4. *General character of relief works.*

In Raipur the total number of relief workers on roads under Public Works Department was 72,787 against 39,213 in March. The numbers fed gratuitously on these works were respectively 16,161 and 11,482. The starting of five new road works which were necessary chiefly accounts for these figures. The large numbers which flock to these works is an indication of the development of distress in the district.

In the Bilaspur District, no new road works were started during the month. The number of relief workers was 19,878 against 13,102 in March. This excludes the Pandaria-Lormi Road which is undertaken for the Court of Wards. The numbers on this road were respectively 3,872 and 1,595.

In Sambalpur District (*a*) relief work (the Dabra-Kharsia Road) under the Public Works Department has been considered necessary. 1,375 persons were relieved on this work. As regards local works, private works in the Raipur District executed by the help of famine loans relieved 45,334 persons, while the number relieved on local works executed by Government was 5,131. This is a substantial increase as compared with the preceding month when a total of 36,974 was relieved on all local works started by the Government and by private individuals.

In the Bilaspur District local works under civil officers gave relief to 910 persons against 1,359 in March. In Court of Wards estates local works gave relief to 2,303 persons against 828 in March. The total number relieved on works started by private individuals was 30,548.

The Deputy Commissioner, Sambalpur, reports that a great deal is being done in the way of tank-digging in the distressed *zamindaris* of Chandarpur and Malkhurda. This work is chiefly done by the help of Famine loans. The Deputy Commissioner has been asked to collect figures showing the total number relieved on local works.

5. *Physical condition of the people.*

The condition of the people is reported to be fair in the Raipur and Bilaspur Districts, excepting in portions of the south-west *zamindaris* in the former district and in the north of the Pendra *zamindari* in the latter district. There are still cases of emaciation however met with in both districts. The Deputy Commissioner, Sambalpur, reports that the people in the Chandarpur *zamindari* were badly off before the road work started, but that they are now picking up rapidly.

6. *Deaths from starvation.*

For Raipur it is reported that arrangements for recording deaths from starvation were not completed till the end of the month, so that the number reported for April, *viz.*, 71, is not quite reliable. It is probable that the figure is much higher. According to the Civil Surgeon's special mortality return for April the total number of deaths from unknown causes was 203. Many of these deaths were apparently caused by starvation, though it may also be true,

as suggested by Civil Surgeon, that a number of persons found dead on road sides had actually died of cholera. The above figures do not include deaths in poor-houses which numbered 162.

Excluding deaths in poor-houses, &c., 189 deaths from starvation occurred in the Bilaspur District according to the Deputy Commissioner's report. This figure does not, however, tally with the special mortality return for April compiled by the Civil Surgeon. This return shows that 356 deaths resulted from starvation. An explanation of the difference has been called for. In the poor-houses of the Bilaspur District 323 deaths occurred. This is a decrease as compared with March, when, according to the revised return now submitted, 520 deaths occurred. In the past month the largest number of deaths, *viz.*, 104, is reported from the Pandaria poor-house. The Pandra poor-house comes next with 94 deaths. In the Bilaspur and Mungeli poor-houses the numbers were respectively 68 and 57. The large number of deaths which continue to be reported from poor-houses is a matter for serious consideration and seems to evidence that the people come there in a very weakly state. I have called upon the Deputy Commissioners of both Raipur and Bilaspur to have a careful enquiry made as regards the number of the deaths reported from poor-houses in the past month, and to communicate to me the result of the enquiry. The following details as regards each death have been called for :—

1. Date on which person was admitted to the poor-house.
2. Condition of person, whether suffering from any disease.
3. Date and cause of death.

In the Sambalpur district four deaths from starvation are reported by the Deputy Commissioner. The Civil Surgeon has telegraphed five deaths from starvation. I have, however, kept the Deputy Commissioner's figure in the absence of an explanation.

7. *Food stock.*

No depletion of food stock is reported in any part of the division excepting Dondi Lohara *zamindari* in the Raipur District, where the supply is reported to be low. There is no reason, however, to fear that private trade will not meet the demand.

8. *Importation of grain.*

Exports have declined in the Raipur district from 172,437 maunds in March to 84,081 maunds in April. In previous months exports showed a steady increase. Imports have increased from 637 maunds in March to 6,955 maunds in April.

In the Bilaspur District the exports amounted to 17,208 maunds, which shows a steady decrease as compared with the exports of the preceding months. Imports amounted to 26,718 maunds as compared with 24,740 in March.

9. *General condition and prospects of the affected area.*

The people are anxiously looking forward for a good season, and it is expected that the prospects will be certainly bright if the season is favourable. The advances of seed grain being made by Government and efforts in the same direction of the Indian Famine Relief Fund Committee encourage the hope (granted a successful season) that distress will altogether disappear with the reaping of the *kharif* crops.

10. *Rates of wages.*

Price of coarse rice in the Raipur District having risen to nine seers per rupee, there has been a corresponding alteration in the famine wages. No changes have been necessary in the other two districts.

11. The Deputy Commissioner, Raipur, reports that petty theft cases have been numerous, but that adequate arrangements have been made for the prevention

of crime. In the Bilaspur District there has been an increase from 107 to 153 in cattle theft and cattle poisoning cases, otherwise the fluctuations are not remarkable. Two dacoities were reported during the month.

No. $\frac{2009}{73-13}$-F., dated Simla, the 6th May 1897.

From T. W. Holderness, Esq., Deputy Secretary to the Government of India Department of Revenue and Agriculture, to the Chief Commissioner, Central Provinces.

I am directed to acknowledge the receipt of Mr. Fox Strangway's letter No. 1934, dated 8th April 1897, giving a revised estimate of the probable expenditure on famine relief operations in the Central Provinces during 1897–98.

2. I am to acknowledge the care with which the figures have been prepared, and to say, with reference to the increase which the revised estimates show over those returned by you in February, that the Government of India are aware that in such a matter the most careful calculations are liable to prove wrong in the result. The course, which in paragraph 5 you propose to adopt, is approved.

3. As regards your remarks in paragraph 2, it might be possible to draw from them the inference that you entertain a doubt whether the relief works are not proving unduly attractive to persons who could in accordance with the habits of the country otherwise manage to support life. But the Government of India are aware, from the correspondence which has passed between them and you, that you are fully alive to the necessity for so regulating the tasks and wages, and other conditions of relief works that the labourers will not prefer the works to other employment. They feel assured that such checks and precautions as appear desirable will be applied, and they recognise that in the presence of severe and general distress the exaction of arduous tasks, or the enforcement of rigorous conditions with that object must be pursued with caution and with due regard to the health and the condition of the relief workers.

No. 905-C., dated Pachmarhi, 18th May 1897.

From M. W. Fox Strangways, Esq., I.C.S., Officiating Chief Secretary to the Chief Commissioner, Central Provinces, to the Secretary to the Government of India, Revenue and Agricultural Department.

In continuation of my letter No. C.-667, dated the 20th April 1897, I am directed to submit a statement compiled from information received from the Administrative Medical Officer and Sanitary Commissioner showing the death rates per mille per mensem, and the deaths from starvation, for the month of April, in 17 of the 18 districts of these provinces. The figures for Chanda, which have had to be returned for correction, will follow.

2. The districts in which there are serious excesses over the normal figure are those of the Jubbulpore Division, and Narsinghpur, Balaghat, Raipur and Bilaspur. By far the largest excesses are in the districts of Narsinghpur and Bilaspur, both of which districts have suffered severely from cholera. The deaths from cholera and small-pox numbered 1,338 in Narsinghpur and 1,219 in Bilaspur and if these be eliminated, the death rates fall to 4·6 and 5·7 respectively. Cholera affected the death rates in nearly all districts; a similar elimination would reduce the Saugor rate to 4·7.

3. The continued decrease in Jubbulpore (from 7·7 in March to 5·4 in April) where the rates in January and February were so abnormally high, is satisfactory; so also is the decrease in Mandla (6·7 to 4·2) and in Balaghat (6·7 to 4·0). In other districts the fluctuations are small.

4. The figures given in the last column of the statement, showing deaths from starvation have been carefully compiled and checked, and are, the Chief Commissioner believes, as accurate as it is possible to make them with the reporting

agency available and the time allowed for compilation, except in the case of Bilaspur and Raipur.

5. Further enquiry is being made into the very large number of deaths reported from Bilaspur, and the result will be communicated hereafter. The number of deaths reported from Raipur also appears very large, but it is not larger in proportion to the population than the numbers in Damoh and Hoshangabad. It must be remembered that a large proportion of the deaths ascribed to starvation are those of wanderers, 305 are so entered in April against 254 in March. In these cases the actual cause of death is often unascertainable, and with cholera prevalent throughout the Province causing the flight from relief works of numerous panic stricken persons, it must often be doubtful whether persons whose bodies are found by the road side fell victims to this disease or to want of food.

6. I am also directed to submit a statement showing the deaths ascribed to starvation in March. The further enquiry, the necessity of which prevented the inclusion of these figures in the March return, has now been made, and the figures are believed to be approximately accurate. It will be seen that the total number of deaths ascribed to this cause has fallen from 912 in March to 844 in April and the enquiry now being made into the Bilaspur and Raipur figures may possibly show that it has fallen still further.

Special mortality return for April 1897.

No. $\frac{2233}{26-20}$ F. *Dated Simla, the 8th June* 1897.

From T. W. Holderness, Esq., I.C.S., Deputy Secretary to the Government of India, to the Chief Commissioner, Central Provinces.

Sir,

I am directed to acknowledge Mr. Fox Strangway's letter No. 2211–F., dated 17th May 1897, submitting the consolidated famine returns for the month of April.

2. Much progress appears to have been made during the month in strengthening and improving the relief-machinery throughout the Provinces. Additional works were opened and village relief expanded to the measure of the necessities of the distressed districts. The greatest increase in the numbers of

	On works.	Gratuitously relieved.	Total.
January ...	249,204	56,856	306,060
February ...	233,678	93,249	326,927
March ...	348,398	130,875	479,273
April	381,045	153,375	534,420

the population receiving relief has occurred under the head of "gratuitous relief." In the special circumstances of the Provinces, this form of relief, which includes poor-houses, relief centres, relief on the works to dependants of the workers and village relief, is of essential importance. The Government of India are glad to find that the additional establishments placed at your disposal have enabled you to greatly extend village-relief in the distressed tracts with the safeguards and precautions necessary to prevent indiscriminate or misplaced charity. To the special attention which has been paid to this subject in the Jubbulpur Division is no doubt due in large measure the satisfactory decline since November last in the death-rate of the districts in this Division, especially in Jubbulpur and Mandla. In the very full and careful review of the April relief returns for the Division village-relief is stated to be "now completely organized in all districts." This review the Government of India presume may be attributed to the late Commissioner, Mr. Priest. The untimely death of that officer from cholera the Governor General in Council most deeply regrets. Your Province has lost an adviser of singular ability and insight, and an administrator fearless and tireless in his devotion to duty. The reports for the other Divisions contain less precise information on the subject of village-relief, but from scattered notices it may be inferred that in the worst districts it has now been effectively established. In Balaghat, the most acutely distressed district in the Nagpur Division, "all villages," it is reported, "are now under supervision," and persons who have refused to leave their homes and who in some instances, as the Deputy Commissioner reports, "have become terribly emaciated," have thus had relief brought to them. In Hoshangabad in the Nerbudda Division "the organization of village-relief has been thoroughly overhauled and greater relief given." In Raipur in the Chhattisgarh Division, regarding the relief arrangements of which you had at one time considerable misgivings, the report received with your letter No. 2684, dated 22nd May 1897, states that "the work of village-relief has now been fully organized in every village throughout the distressed area," and that "more than half the distressed villages have been personally visited by an Assistant Collector."

3. The improvement in the physique and health of the labourers on relief works, which is remarked on by officers in the Jubbulpur Division and elsewhere, is evidence of the sufficiency of the wage-scale of the Famine Code, although in that division 110,000 labourers of a total of 151,000 on relief works are returned as receiving the lowest, or class D, wage. In the Nerbudda Division, on the other hand, class D workers are in the minority. The Government of India have no doubt that this difference of classification correctly reflects a substantial difference in the condition of the people coming on the works in this Division, but would be glad to know whether any inspections have been made to verify this assumption. It should also be stated whether it is the practice to show all working children in the class D column. The result of substituting piece-work for task-work in the Jubbulpur, Mandla and Seoni Districts, where the labourers are said to be now quite healthy and strong and where enforcement of a proper task has been found difficult, will be watched with interest.

4. In the Jubbulpur Division the improvement in the health of the general population, to which the ripening of the *mahwa* and the harvesting of the *rabi* crops have contributed, is equally satisfactory. The Government of India also observe with pleasure that in Balaghat cases of emaciation are becoming "comparatively rare," that in Hoshangabad the Commissioner noticed "few cases of emaciation," and that in Chindwara, in the wilder parts of which the effective organization of relief has been a difficult matter, the Deputy Commissioner remarks on "the absence of village starvelings, even in the most distressed tracts." In Raipur and Bilaspur cases of emaciation are still met with in the distressed tracts, and it would seem that the centre of distress has now shifted from the west of the Provinces to the rice-growing districts of the east. In Raipur the number of persons in receipt of state relief had risen in the third week of May to 72,787, and 45,334 others were employed by zemindars on petty works executed out of loan

funds. In Bilaspur on the same day 19,878 persons were in receipt of state relief, and 30,548 others were given employment by means of famine loans. In these two districts the death-rate has risen considerably,* the poor-house population has increased, especially in Bilaspur, and the mortality among the inmates has been heavy. The existence of severe distress in the zemindari tracts of these two districts has been noticed in successive monthly reports, but judging from the rapid increase in the numbers seeking relief and other circumstances it has evidently developed more rapidly, and will entail greater expenditure and larger relief arrangements, than you anticipated in the general survey of the scarcity prevailing in the Provinces submitted in your letter No. 849 of the 12th February 1897. The full and interesting report on the Raipur District by Mr. Younghusband, Commissioner of the Chhattisgarh Division, which accompanied your letter No. 2684, dated the 22nd May, satisfies the Government of India that the necessity for relief on a large scale in this district has been clearly recognised by the local officers, and that with the strengthened establishments at the disposal of the Deputy Commissioner the relief arrangements will prove sufficient. In view of the apprehensions at one time entertained on this point the Governor General in Council is glad to have the Commissioner's assurance, founded on close examination of the facts, that "the actual relief of distress in the Raipur District is on a thoroughly efficient footing." Should similarly detailed information be available for Bilaspur, and also for Balaghat in the Nagpur Division, the Government of India would be glad to see it.

DEATH-RATE PER MILLE PER MENSEM.

*	January.	February.	March.	April.
Raipur ...	2·7	2·0	2·9	4·1
Bilaspur ...	3·1	2·7	5·2	6·7

5. The latest return showing the classified mortality of the Provinces which the Government of India have seen is that for March last (published in the Central Provinces Gazette of the 22nd May). Excluding cholera and small-pox deaths, the death-rate for March 1897 for 19* registration districts of the 20 into which the Provinces are divided was 40·80 per mille per annum. The corresponding death-rate in the March of the three preceding years was, respectively, 39·29, 27·77 and 38·50. The comparison therefore, if the unparalled calamity which has befallen the Provinces be regarded, is not unfavourable. The April death-rate has been swollen by heavy mortality from cholera. From the information contained in the Famine Statements and Notes for the month it seems probable that the classified mortuary returns for April will show a death-rate, exclusive of cholera and small-pox, lower than the March rate. The death-rate for April 1894, it may be noted, was 45·22, exclusive of cholera and small-pox. The death-rate for April 1897 will be less than this.

*Bilaspur not returned.

6. The number of deaths shown in column 16 of Statement A as due to starvation is greviously large in five or six districts. But it is clear from the divisional and district remarks that the returns include deaths from unknown causes which have been attributed without sufficient evidence to starvation by the reporting agency. The Jubbulpur Divisional report contains some very good remarks and suggestions on the subject with which the Government of India agree. In the Hoshangabad district report it is noted that in 16 deaths only out of 81 entered in column 16 had the cause of death been verified. In the Jubbulpur District it was found in scrutinising the Civil Surgeon's returns that *all* deaths from *all* causes occurring in one of the registration circles had been returned as starvation deaths. More pains to secure correct classification and verification of such deaths, in accordance with your Circular Order of the 4th February 1897, appear to have been taken in the Jubbulpur Division than elsewhere, but, as the Commissioner remarks, when as often happens the deceased are wanderers without friends or companions, "real verification is impossible." In the Chindwara return 11 of the 25 cases entered in column 16 were of this description. The Government of India think that further precautions are required to secure proper examination of the figures for each district before they are returned, and to exclude deaths from cholera or unknown causes.

7. The *rabi* has unfortunately been poor. The final forecast of the wheat crop, which in ordinary years occupies 4 million acres of the 14 million acres under food crops in the Central Provinces, shows that less than one-half of the usual area was sown and that the yield per acre was much below the average. In

the Jubbulpur Division the area sown with wheat was but 500,000 acres against an average of 1,500,000 acres, and the outturn was proportionally small. The linseed crop, which in ordinary years is one of the most valuable money crops in the Provinces, has also been disastrously bad. The area sown was only one-third of the average area under linseed, and the yield in tons scarcely one-fifth of the usual amount.

8. In the Provinces as a whole the grain-trade has been active and enterprising and has proved itself equal to the emergency. The effect of this activity and of the facilities for the transport of grain in bulk given by the railways is seen in the close equalisation of prices throughout the country. Every oscillation in local prices in tracts open to the railway has been at once followed by a corresponding movement of grain from the cheaper to the dearer markets. In some, at least, of the distressed districts of the Central Provinces there were undoubtedly in the hands of the great grain merchants of those tracts extensive stores of grain, and these have been gradually drawn out by rising prices. This explains the apparent anomaly of considerable exports of wheat from the Jubbulpur Division, and of the still larger exports of rice from Raipur and Sambalpur. With the completion of the *rabi* harvest in the North-Western Provinces and the Southern Punjab the tide has now turned, and the traffic returns for May show a net import of food-grains into the Jubbulpur, Nerbudda, and Nagpur Divisions. In the Chhattisgarh Division export still continues though on a much smaller scale than in the preceding months from Sambalpur, in which district reserves of rice were known to be large. It has completely stopped in Raipur, a district which from January to the end of April had exported on a large scale. It may be presumed that prices in Raipur have now reached a point which makes export no longer profitable.

9. The only districts in which special measures for the supply of food-grains during the rains, owing to defective communications and the inertness of local trade, are considered by you to be necessary are Mandla and Balaghat. Approval to the Mandla arrangements has been communicated to you in my telegram of the 1st instant, and it is desirable that the scheme for Balaghat which is said to be under preparation should be settled and brought into operation at an early date. The question of a sufficient supply of seed-grain, which at one time gave cause for anxiety, appears to be no longer pressing except in one or two exceptional districts. In your letter of the 22nd May you have reported the special measures which have been taken in the Raipur District. Rupees 2,00,000 has been advanced by Government to cultivators for purchase of seed, and well-to-do landlords have been induced to provide seed-grain, which has been stored until the cultivators require to draw on these reserves. In representing that this amount was insufficient for the want of the district the Deputy Commissioner presumably was unaware of the very large sum which the Central Committee of the Indian Charitable Relief Fund has allotted to the Central Provinces for seed-grain and cattle. The Government of India would be glad to know whether in Balaghat the Deputy Commissioner has succeeded in placing seed-grain in the Baihar Tahsil. In Mandla the apprehended exhaustion of seed of the lesser millets occasions a special difficulty. Elsewhere it may be anticipated that seed-grain will be forthcoming now that the dealers are aware that the cultivators have by the liberality, in the first instance, of the Government and now of the Famine Relief Fund been supplied with money to buy from them. The inestimable benefits of that fund are very fittingly acknowledged by the Commissioner of the Jubbulpur Division in the opening paragraphs of his report.

10. This review of the situation will serve to assure you of the sympathetic interest with which the Governor General in Council has watched the devoted efforts of the officers of all ranks in all Departments working under your control to successfully relieve distress, and to bring the people through the struggle in a condition to resume their ordinary avocations on the setting in of the rains. These efforts have so far succeeded in spite of exceptional difficulties, and the Governor General in Council trusts that a favourable season will shortly ease the strain of the situation, and bring relief alike to the people and to an overtasked administration.

I have the honour to be, &c.,

Your most obedient Servant,

T. W. HOLDERNESS,

Deputy Secretary to the Government of India.

NORTH-WESTERN PROVINCES AND OUDH.

No. 1065 of 1897, dated Allahabad, the 28th April 1897.

From the Secretary to Government, N.-W. Provinces and Oudh, to the Secretary to the Government of India, Revenue and Agricultural Department.

SIR,

I am directed to submit the monthly Famine Statements A and B for these provinces, which give details of the relief operations up to 27th March 1897 in nineteen districts officially recognised as distressed, and *extra*-Code Statement C, which contains particulars in regard to the districts which were under observation during the period under report, though not officially declared distressed.

2. The figures now furnished in Statement B afford much better idea than the previous statements of the relief granted in the shape of revenue suspensions and advances under the Land Improvement and Agricultural Loans Acts. But they are still to some extent incomplete, as it has not been found possible to bring the account of such expenditure fully up to date. Statement C does not seek to show the outlay under this head in districts not officially declared to be distressed. But in the districts included in that statement the returns at present available show advances under the two Acts aggregating Rs. 4,84,026, and revenue suspensions aggregating for fifteen districts Rs. 19,97,542, bringing the totals under these heads to Rs. 15,23,993 and Rs. 72,43,542 respectively.

I have, &c.,

T. STOKER,

Secy. to Govt., N.-W. P. and Oudh.

NORTH-WESTERN PROVINCES AND OUDH.

REMARKS TO ACCOMPANY FAMINE STATEMENT A FOR THE FOUR WEEKS ENDING 27TH MARCH 1897.

AGRA DISTRICT.

1. *Private relief, village and poor-house relief.*—Rupees 5,800 have been received from the Indian Famine Charitable Relief Association, in addition to the Rs. 24,000 or thereabouts which were locally subscribed. The money is devoted chiefly to house to house relief in Agra city, where only half the sum required is provided by Government.

Village relief is distributed, at the cost of Government alone, by the circle relief officers. Five poor-houses were open during the month, but one (that at Fatehpur Sikri) has since been closed.

2. *General character of relief works.*—Chiefly intermediate works under Public Works Department; but three or four works are being carried out under section 65(*a*) of the *Famine Code* by proprietors, to whom Government has made partly recoverable advances for the purpose.

3. *Physical condition of the people.*—Fair, and much better than at the time of the last monthly report, when the harvest had not yet begun. Prices have, of course, fallen considerably since then.

4. *Deaths due to starvation.*—None.

5. *Food stocks and importation of grain.*—Stock sufficient. There have lately been considerable exports to Gwalior and Jhánsi.

6. *General condition and prospects of affected area.*—The number of persons relieved has fallen in a month from about 40,000 to about 17,000 in consequence of the harvest. The numbers will go up again in May and June when the harvest is over, as a considerable population of hired labourers will then be without employment. The distress is expected to cease on the fall of the rains early in July.

7. *Changes in rates of wages, &c.*—The intermediate system was introduced on the 15th March. Under that system a fixed sum, usually Rs. 2-3-0, is given for the excavation of every 1,000 cubic feet of earth; and labourers are no longer paid by the day.

ETÁWAH DISTRICT.

1. *Private relief, village and poor-house relief.*—A few wealthy men distribute charity daily or afford relief to the poor. In Act XX towns and the city relief is given from the funds raised from subscriptions; relief is also given in district partly from these funds and partly from Government funds. There is one poor-house at the headquarters of the district, in which the number of inmates on 27th March 1897 was 85.

2. *General character of relief works.*—The numbers on the relief works, Etáwah-Kálpi road, on 27th March 1897 were 1,396. The rapid decrease is due to the people going away to harvest the crops, which is more remunerative employment.

3. *Physical condition of the people.*—The condition of the people is generally good.

4. *Deaths due to starvation.*—No deaths reported from starvation.

5. *Food stocks and importation of grain.*—Food stocks sufficient, and imports considerable.

6. *General condition and prospects of affected area.*—The affected area in this district is chiefly the trans-Jumna and Chambal tract, which is entirely dependent on next autumnal rains. *Kharif* harvest was poor, and *rabi* almost *nil*.

7. *Changes in rates of wages, &c.*—Rates of wages have fallen everywhere in the district, except villages favoured with irrigation.

Cawnpore District.

1. *Private relief, village and poor-house relief.*—Columns 18 to 21 do not include persons supported by the Famine Relief Fund. These numbered about 2,000 on the last day of the month.

2. *General character of relief works.*—Road works under Public Works Department; labourers in fair condition; wages sufficient. Numbers have decreased, owing to more profitable work being available in harvesting. Task of 125 feet rarely performed. Raising of task and reduction of scale of wages have had an effect in sending people off the roads to work on the fields, but even with the former task and scale very many would have gone.

3. *Physical condition of the people.*—Much improved by the harvest.

4. *Deaths due to starvation.*—*Nil.*

5. *Food stocks and importation of grain.*—Food stocks sufficient. Import trade brisk; export slack.

6. *General condition and prospects of affected area.*—The affected area has fallen to the dimensions of the closing months of last year. Owing to the cold weather and the stoppage of agricultural work, distress spread through the whole district in January and February, but now with a fair harvest the irrigated parts of the district have recovered.

7. *Changes in rates of wages, &c.*—Wages were changed from the 10 and 9½-*sér* scale to the 12-*sér* scale at the beginning of the month.

Fatehpur District.

1. *Private relief, village and poor-house relief.*—The amount received from the Indian Famine Charitable Relief Fund is distributed through the Local Committee. The subscriptions are also administered by the Committee. The system of village relief is in full operation. The management of poor-house is satisfactory; number of inmates not very large; able-bodied are immediately drafted to works.

2. *General character of relief works.*—Large relief works are under the management of the Public Works Department. Number of relief workers decreasing daily.

3. *Physical condition of the people.*—Generally good.

4. *Deaths due to starvation.*—*Nil.*

5. *Food stocks and importation of grain.*—Supplies sufficient; importation moderate.

6. *General condition and prospects of affected area.*—The *mahua* crop and *rabi* harvest attracted away the relief workers; and the present outturn of *mahua* improves the prospects of affected area.

7. *Changes in rates of wages, &c.*—The intermediate rates prescribed in Government Resolution No. $\frac{753}{S.-73}$, dated 16th March 1897, introduced from 1st April 1897.

Banda District.

1. *Private relief, village and poorhouse relief.*—There is little or no private relief in the district. Relief Committees of District and Municipal Board members and others have been formed. Rupees 40,300 have been received from the Provincial Relief Committee, which are being utilized in supplementing village and poorhouse relief in kind. Rupees 9,845–10–8 were spent on this account during the month of March 1897. The numbers of persons relieved under Chapters V, VIII, and X on the 27th March 1897 were 22,752, 2,778, and 1,934 respectively, and the total amount spent under these heads during the four weeks ending 27th March 1897 was Rs. 31,314–7–4, Rs. 7,501–7–10, and Rs. 2,569–12–3 respectively: 615 persons were relieved by the police, to whom Rs. 42–12–3 were paid.

2. *General character of relief works.*—The character of large relief works under Public Works Department agency was special repairs to the existing *kachchá* roads, the deepening of roadside tanks, and breaking of stones, and that of the works under District Officers was excavation of villages, tanks, and embankments.

3. *Physical condition of the people.*—The physical condition of relief workers and that of the inmates of poorhouses is fair. Cholera broke out on the Bhadausa work, but the workers have been shifted, and it is hoped to stamp it out before it becomes virulent.

4. *Deaths due to starvation.*—No direct deaths due to starvation were reported to have taken place during the month.

5. *Food stocks and importation of grain.*—Prices of wheat and gram have slightly fallen, while those of other commodities have risen. Markets are sufficiently stocked, and importations of grain from out stations still continue. About 80,529 maunds of grain were imported into the district during the four weeks under notice. There is thus no fear of food stocks running short for the present.

6. *General condition and prospects of affected area.*—The general condition of the affected area has slightly improved, owing to the advent of the *mahua* season, which promises a good crop, but less so in the hill tract than elsewhere. *Mahua* crop was slightly damaged by dusty and cloudy weather. Early sown *rabí* is being harvested, but that sown recently has failed and is being used as fodder.

7. *Changes in rates of wages, &c.*—The scale of wages remained unchanged during the period under notice, but has been reduced from 8 to 7 pice downwards with effect from 28th March 1897 on a 10-*sér* basis.

Hamírpur District.

1. *Private relief, village and poorhouse relief.*—Ordinary private relief much contracted. From the Charitable Relief Fund allowances were made to 1,626 persons, besides supplementary doles to children on gratuitous relief. Much needed clothing is being widely distributed from the same fund, and the list of respectable persons to be assisted from it is being rapidly added to. Village relief is distributed by selected zamindárs. Poorhouses are managed by hospital assistants under the general control of the Civil Surgeon.

2. *General character of relief works.*—There are 13 large works in progress, consisting of improvements to unmetalled roads, and excavation of tanks. The excavation of eight small tanks as village works was in progress. This form of relief is now being expanded.

3. *Physical condition of the people.*—Generally fair: in villages are to be found a number of people, usually of low caste, who have run down simply from delaying too long to go to relief works. These are put on gratuitous relief for short periods, and when fit are drafted to relief works.

4. *Deaths due to starvation.*—No deaths from starvation reported.

5. *Food stocks and importation of grain.*—Stocks are depleted; but the *rabí* harvest will to some extent remedy this, and importations still continue. Supplies sufficient.

6. *General condition and prospects of affected area.*—The protracted scarcity heavily taxed the resources of the people. The harvest, most of which is over, reduced numbers on relief but little, and they have risen steadily all the month. The *mahua* crop is fair and is of great assistance; but numbers on relief must go on increasing, and will probably reach 120,000 in April.

7. *Changes in rates of wages, &c.*—A rate of 10 *sérs* is still adhered to in calculating wages, nor do prices suggest any change from this.

Allahabad District.

1. *Private relief, village and poorhouse relief.*—The poorhouse population has fallen from over 9,000 to 3,422, partly from the inmates having been drafted to outdoor (village) relief, and partly because people have left to gather *mahua*. Nearly half the numbers receiving outdoor relief are paid from the Charity Fund.

2. *General character of relief works.*—Tank work has largely taken the place of road work, and in the southern tahsíls (where cholera has been prevalent) large tank works have been broken up, and the people are employed on a considerable number of small tank works, which bring relief nearer to them in their villages.

3. *Physical condition of the people.*—There is considerable improvement compared with the state of affairs two months ago; the people are in better spirits, and no longer throng the camps of officers on tour with general supplications for assistance.

4. *Deaths due to starvation.*—None reported that can be accepted as verified. Diarrhœa has accounted for most of the deaths which have occurred in poorhouses and on works during the month. It is now happily abating.

5. *Food stocks and importation of grain.*—The country south of the Jumna is practically altogether dependant on imports. Trade has responded to the effective demand created by the expenditure of money on relief, and petty traders abound wherever they are required.

6. *General condition and prospects of affected area.*—A very good *mahua* crop and the spring harvesting have combined to ameliorate present conditions. But the numbers applying for relief may be expected to rise again. The spring crop is put at only a third of the normal in the less distressed part of the district.

7. *Changes in rates of wages, &c.*—In the less distressed tahsíls wages are calculated on a 12-*sér* basis, but south of the Jumna the basis of calculation has been returned as 10 *sérs*.

Jhánsi District.

1. *Private relief, village and poorhouse relief:*—

Private relief	...	...	...	1,666, relieved on 27th
Village relief	...	...	...	10,432, „ „
Poorhouse relief	...	...	...	2,166, „ „

2. *General character of relief works.*—Roads and tanks. Five petty works in charge of the zamindárs under section 65 (*a*), Famine Code, were experimentally opened.

3. *Physical condition of the people.*—Pretty fair, but bad in the case of *Koris*, *Saharyas*, and low caste people.

4. *Deaths due to starvation.*—None.

5. *Food stocks and importation of grain.*—Food stocks are sufficient.

	Mds.
Imports by rail	35,826¼
Exports „	2,470
Excess of imports	33,356¼

6. *General condition and prospects of affected area.*—Almost the whole of the *rabí* is now cut. The yield has been good on irrigated lands, but the area is very circumscribed.

7. *Changes in rates of wages, &c.*—Sunday labour has been stopped, and persons who have been present on the works from Thursday to Sunday now get Sunday wages at minimum rates. No other change has been made, the wages being calculated according to the ready reckoner on staples selling at 10 *sérs* per rupee.

Jalaun District.

1. *Private relief, village and poorhouse relief.*—Four poorhouses are open. Village relief is given in accordance with the provisions of Chapters V and X, Famine Code. Very little private relief is given.

2. *General character of relief works.*—Improvement of unmetalled roads and restoration of village tanks.

3. *Physical condition of the people.*—The physical condition of the people is, on the whole, satisfactory.

4. *Deaths due to starvation.*—None.

5. *Food stocks and importation of grain* —Food stocks are sufficient.

6. *General condition and prospects of affected area.*—The large numbers who left the relief works with a view to the harvesting of the *rabí* crops are returning to their districts, and will soon again seek relief on the works.

7. *Changes in rates of wages, &c.*—No change has been made.

Mirzapur District.

1. *Private relief, village and poorhouse relief.*—Private relief is being distributed by the Indian Famine Charitable Relief Famine Committee through a Local Committee, and Rs. 5,400 have been distributed by that body during the month of March. The inmates of the poorhouses are being drafted off to their homes, to be relieved there under the village relief system. There were a few cases of cholera in the Lohndi and Lalganj poorhouses; prompt measures were taken, and the disease has disappeared. Village relief is being systematically distributed.

2. *General character of relief work.*—Relief works are generally well managed and properly supervised.

3. *Physical condition of the people.*—There is a marked improvement in the physique of the persons on relief works as well as those on village relief.

4. *Deaths due to starvation*—No deaths have yet been verified to be due to starvation.

5. *Food stocks and importation of grain.*—Food stock is sufficient in the markets and supplemented by imports from the eastern districts.

6. *General condition and prospects of affected area.*—There is some slight improvement in the condition of the people, and the *mahua* crop has helped in minimizing the severity of the distress to some extent. Though the numbers on relief works have considerably fallen at present, an increase must be soon apprehended.

7. *Changes in rates of wages, &c.*—The rates of wages have been reduced since last month.

Family Domains of the Maharája of Benares.

1. *Private relief, village works, and poorhouse relief.*—No private relief; no poorhouses. In affected tract, Chakia, the numbers on village relief are 3,393, and constitute 4·5 per cent. of the population. In Gangapur the number was 132, being 0·15 per cent., and in Bhadohi it was 840, the percentage being 0·3.

2. *General character of relief works.*—Works consist of embankments and deepening tanks.

3. *Physical condition of the people.*—Improving, but still backward in Naugarh.

4. *Deaths due to starvation.*—*Nil.*

5. *Food stocks and importation of grain.*—Sufficient importation of rice proceeds. *Kharíf* grains, *nil.*

6. *General condition and prospects of affected area.*—*Rabí* crop light and poor; area much below the average.

7. *Changes in rate of wages, &c.:*—

Wages in Chakia changed from 11-*sér* rate to 12-*sér* rate on 18th.
" Naugarh " 9-*sér* " 10-*sér* " 28th.

Jaunpur District.

1. *Private relief, village and poorhouse relief.*—Relief being given from the general fund. Village relief distributed weekly through all *patwáris* assisted by respectable residents. Three poorhouses open as before.

2. *General character of relief works.*—Digging and deepening tanks.

3. *Physical condition of the people.*—Has improved considerably during the month. Harvesting operations have been general and the attendance at the works fell largely.

4. *Deaths due to starvation.*—No verified deaths from starvation.

5. *Food stocks and importation of grain.*—Imports still well in excess of exports. Food stocks sufficient, but prices still very high.

6. *General condition and prospects of affected area.*—Have improved, except in a small area to the east of Khutahan, where *rabí* also has failed.

7. *Changes in rates of wages, &c.*—Wages paid at 12-*sér* rate from March 1st, and intermediate system introduced on all but two works towards the close of the month.

Gorakhpur District.

1. *Private relief, village and poorhouse relief.*—The number in receipt of village relief is increasing, owing to the closing of some poorhouses. Private relief is given, notably in the Padrauna tahsíl, by large landowners, and to a considerable extent by European planters in the Gorakhpur and Mahárájganj tahsíls.

2. *General character of relief works.*—Relief works have hitherto been large works on roads and roadside tanks under Public Works Department control. Intermediate works will now take their place. There are few 65(*a*) works. It is, with one or two exceptions, a difficult matter to get them taken up.

3. *Physical condition of the people.*—Improved considerably.

4. *Deaths due to starvation.*—One case of death by starvation has been verified by Mr. Burn. The deceased was to blame, as he was resident on the Rája of Tamkuhi's estate only three miles from the Rája's poor-house.

5. *Food stocks and importation of grain.*—Food stocks are sufficient and being replenished by *rabí* cuttings.

6. *General condition and prospects of affected area.*—The *rabí* harvest operations drew many labourers from relief works in the middle of the month, but a rise is again apparent. There was rain during March, very heavy in some parts, but no damage has been reported, save around Gola.

7. *Changes in rates of wages.*—No change.

Azamgarh District.

1. *Private relief, village and poor-house relief.*—Village relief has been sufficient during March. So has poor-house relief. Private relief money has been allotted for clothes, and has been spent in aiding poor persons within the municipality.

2. *General character of relief works.*—The relief works have generally been roads and village tanks ; also *kankar* collection on 1st class roads.

3. *Physical condition of the people.*—The condition of the people has been very fair indeed.

4. *Deaths due to starvation.*—None reported.

5. *Food stocks and importation of grain.*—Food stocks have been sufficient, and there has been a considerable local supply of wheat and barley. Of these grains, there has been very little importation. But gram and rice have been largely imported.

6. *General condition and prospects of affected area.*—The condition of the affected area improved materially during March. At present, too, it is far better than it was. The distressed tract in the south of the district needs careful attention.

7. *Changes in rates of wages, &c.*—Wages are good generally, and the relief works and railway supply whatever work is needed. The rates of wages on intermediate works give satisfaction.

Lucknow District.

1. *Private relief, village and poor-house relief.*—Private relief in the city of Lucknow and in a few distressed Muhammadan towns of the district. Village relief system working smoothly ; 1·6 per cent. were in receipt of this relief in the district. The poor-houses were well supervised, and the organization was good.

2. *General character of relief works.*—Raising district roads ; constructing *thalas* thereon. A few tanks were started on the half repayment system. Improvements on Courts of Wards' estates were started.

3. *Physical condition of the people.*—Improving. The village relief system was in full working order, and the labouring classes were in excellent physical condition. Work was available for all who were in need of it.

4. *Deaths due to starvation.*—None reported.

5. *Food stocks and importation of grain.*—Sufficient importations of wheat, barley, gram, and Burma rice into Lucknow have been considerable. This was partially exported to the district markets, which also received supplies from the crops reaped from the middle of the month.

6. *General condition and prospects of affected area.*—Condition has improved owing to the harvest, which commenced in the second week of March.

7. *Changes in rates of wages, &c.*—Eleven *sérs* from 1st March ; 12 *sérs* from 7th March. The effect of the latter rate was to send people off the works to the fields, where their services were required in cutting the crops.

Unao District.

1. *Private relief, village and poor-house relief.*—Private charity not active. The necessity for village relief on a large scale still continues. Residents of the district have been largely removed from poor-houses.

2. *General character of relief works.*—Ten large works were open and one small village work (experimental). The work done consisted of raising and claying unmetalled roads.

3. *Physical condition of the people.*—Is fair. No sickness on works, but in poor-houses deaths from dysentery still continue.

4. *Deaths due to starvation.*—*Nil.*

5. *Food stocks and importations of grain.*—The stock of coarser grains is practically exhausted. Importations have decreased, new barley and peas meeting all demands.

6. *General condition and prospects of affected area.*—The people are busily engaged in getting in the *rabí*. The harvest is three parts complete. Pressure amongst the labouring classes is apprehended on its completion. The outturn is disappointingly low. The unirrigated crop has practically failed.

7. *Changes in rates of wages, &c.*—Up to the 5th wages were based on a staple at 10 *sérs*. From that date to the end of the month the 12-*sér* scale was in force.

Rae Bareli District.

1. *Private relief, village and poor-house relief.*—Local and tahsíli committees organized for private relief from funds of Indian Charitable Relief Fund. Village relief under Chapter V and relief to *parda nashins*, &c., being given. Four poor-houses at the headquarters of each tahsíl already in existence, where the numbers are now falling.

2. *General character of relief works.*—Special repairs to, and improvements of, roads as well as tank works under Public Works Department, where intermediate system has very recently been introduced. Small works consist of embankments and tanks.

3. *Physical condition of the people.*—Not quite satisfactory, but improving.

4. *Deaths due to starvation.*—None reported.

5. *Food stocks and importation of grain.*—Quite sufficient, and imports have considerably fallen.

6. *General condition and prospects of affected area.*—General condition is improving, and the prospects are more favourable owing to a fairly good *rabí*, which is generally being cut and brought to threshing floor. *Mahua*, which is generally consumed by the poorer classes, has been abundant. Field labour is also supporting a large number.

7. *Changes in rates of wages, &c.*—Twelve-*sér* scale introduced under orders of Government. Numbers much diminished all round, and a further decrease is expected owing to larger demand of field labour. Prices have also gone down, though not to any great extent.

Sitapur District.

1. *Private relief, village and poorhouse relief.*—Private relief was practically confined to distributing clothing during the month. Lists have been prepared for distribution of aid to agriculturists and are under consideration. Under village and poorhouse relief the number has fallen 75 per cent.

2. *General character of relief works.*—The chief defect is short work ; 9″ is put down on the road and measured as a foot. Also there is reason to suspect false gang rolls on some works.

3. *Physical condition of the people.*—Good on the whole, and, as far as I can judge, it seems to be improving.

4. *Deaths due to starvation.*—Nil.

5. *Food stocks and importation of grain.*—Supplies quite sufficient ; exportation brisk ; new grain was procurable in sufficient quantities ; prices were fluctuating. The *kharíf* grains are now becoming scarce.

6. *General condition and prospects of affected area.*—Numbers on the works have fallen considerably. The condition of the people will remain good for about a fortnight or three weeks at least.

7. *Changes in rates of wages, &c.*—No change.

Hardoi District.

1. *Private relief, village and poorhouse relief.*—(*a*) A local committee has been formed to administer funds remitted by the Provincial Committee as well as those realized locally, and the distribution of relief from these funds has already been started.

(*b*) Village relief is administered by the special officers appointed for the purpose, and the lists undergo constant scrutiny.

(*c*) There are four poorhouses—one at the headquarters of each tahsil.

2. *General character of relief works.*—Constant raising and repair of roads; and the deepening of tanks [section 65 (*a*)].

3. *Physical condition of the people.*—There is some improvement in the condition of the people. The harvesting operations are in full swing, and people find employment on field labour.

4. *Deaths due to starvation.*—None reported.

5. *Food stocks and importation of grain.*—Food stocks are being replenished by the new grain. Rice and peas are imported from other districts.

6. *General condition and prospects of affected area.*—The progress of harvesting operations has improved matters slightly. The decrease in the numbers on relief works has been steady and is likely to continue till the middle of this month, when the return of the workers is expected. The prospects of the early *rabi* are fairly good, but the late crops have been almost entirely destroyed.

7. *Changes on rates of wages, &c.*—Private wages have risen. These on relief works are regulated in accordance with the Famine Code.

Bara Banki District.

1. *Private relief, village and poorhouse relief.*—Numbers in poorhouses have declined considerably; chiefly the old, sick, and feeble left. Those now on village lists are all old, decrepit, blind, lame, &c. Owing to the harvest, private relief also has contracted somewhat.

2. *General character of relief works.*—A few village works. These are works started in January and February and are being finished off.

3. *Physical condition of the people.*—Good.

4. *Deaths due to starvation.*—Nil.

5. *Food stocks and importation of grain.*—Stocks sufficient. Export of wheat has begun.

6. *General condition and prospects of affected area.*—Good. District was last week taken off the list of those officially distressed.

7. *Changes in rates of wages, &c.*—Nil.

Monthly Famine Statement B for the four weeks ending Saturday evening, the 27th March 1897.

Division	District.	Maximum number (daily average for three months) for whom relief is estimated to be required in case of serious famine.	*Number of persons (daily average for three months) for whom relief was provided in the last programme of relief works.*			*Numbers for whom relief can be provided on works remaining on programme on date of report.*		*Expenditure since 1st November 1896.*			*Advances since 1st November 1896 up to end of month under report under—*		*Revenue suspended since 1st Nov. 1896.*
			Date of publication of programme.	On large works.	On others.	On large works.	On others.	Date up to which account is made up.	On relief works (excluding gratuitous relief to dependants).	On gratuitous relief (including that to dependants on relief works).	Land Improvement Loans Act.	Agriculturists' Loans Act.

No. C. 3067-F., dated Lucknow, the 5th May 1897.

From C. W. Odling, Esq., Secretary to the Government of the North-Western Provinces and Oudh, Public Works Department, to the Secretary to the Government of India, Department of Revenue and Agriculture.

With reference to your letter No. 927-F., of the 25th March last, forwarding printed papers relating to famine relief operations in Bengal and asking for such information as this Government may have at hand regarding the average quantity of work done by relief-workers on the relief-works in the several districts of these provinces and the average cost of earthwork executed under famine conditions, I am directed to enclose a statement* giving this information for the month of February as regards Gorakhpur and Azamgarh Districts adjacent to some of the Bengal Districts mentioned in the correspondence received. The cost of earthwork† per 1,000 cubic feet in Gorakhpur and Azamgarh is higher than in Saran but less than in Champaran.

* Marked A.

† Famine Code Works.

2. The conditions which prevail in these provinces appear however, so far as the severely distressed districts are concerned, to be widely different from those which obtain in Bengal. Practically, except in a few districts adjacent to Bengal, like Gorakhpur and Azamgarh, and in the Rohilkhand and Agra Divisions, where scarcity, and not famine, prevails, four carriers, mainly women and children, have to be employed for every digger whether required by the nature of the work or not. These and other circumstances regarding the conduct of relief operations in the North-Western Provinces and Oudh are discussed in some detail by Colonel Pulford and Mr. Palmer, Superintending Engineers, to whom the matter was referred.

3. The point to which attention has been primarily directed, both in the present and the Bundelkhand famine in the early part of 1896, has been the expenditure per unit relieved. As much care is required and has, as a matter of fact, been taken to ensure a sufficient sum being allowed so as to prevent any tendency to unnecessary expenditure. But the necessity of rendering the task sufficiently severe to deter all not in real distress from attending the works has never been lost sight of. As pointed out in the notes by both Superintending Engineers there has been a tendency to fix the task so high that in districts where the soil is hard the workers could not perform it. With a task of 60 cubic feet and the wages fixed on a basis of 10 seers per rupee the rate, if full tasks were executed by all diggers, would be Rs. 6-4 per 1,000 cubic feet and the average task per worker 12 cubic feet dug and carried. In practice the average task is always less than the full task and the actual cost per 1,000 cubic feet (on the basis mentioned) in excess of the sum stated. On the other hand, there are districts (those in Rohilkhand may be taken as examples), where the task has been fixed as high as 125 cubic feet per digger without complaint, and where the average rate for February was lower than in Gorakhpur.

4. The differences between the black cotton and *morum* soil of the greater part of Allahabad and Bundelkhand and the loose soil to be found in other districts and also the differences in the ordinary occupations of the people (some districts containing a large proportion of professional *beldars*) is in fact such that any comparison of rates as an index of efficient management of famine relief operations must be misleading, even if the number of carriers necessarily but not effectively employed, to which reference has already been made, is left out of the question. Over small areas of similar character as regards soil and people such comparison may no doubt be usefully made. In the whole province during the month of February 5,220 lacs of earthwork, costing ‡Rs. 19,30,444 in wages of workers (excluding dependants), were executed, the average rate being, as stated by Sir Antony MacDonnell at a meeting of the Legislative Council of these provinces, Rs. 6 per 1,000 cubic feet. Seeing that three-fifths of the expenditure was in the Allahabad and Lucknow Divisions in which severe distress prevails, it is unlikely that under any system of management substantially more work could have been obtained and any diminution in the expenditure would have rendered the relief afforded less than

‡ *Vide* Statement B.

was necessary for sustaining the workers in a proper condition of strength and health. One result of the consideration exercised has been a marked improvement in the condition more especially of the children, but also of the men and women who have, in districts where there has been a fair harvest, left the works, in many cases, it is hoped, not to return.

5. It must not be forgotten that the works carried out have been selected with the object of giving employment to all requiring it in localities where distress exists (in these provinces mostly severe distress) and that having regard to the physical condition of the people, it was not possible to take as the chief object to be aimed at, the execution of the works at the lowest rate. The difficulty in localities severely distressed has in fact been to find sufficient suitable employment for the large number of persons requiring relief within a small area. Works where the lead is long and lift considerable have been deliberately preferred. In works not of this character, it has been found absolutely necessary in works carried out on the intermediate system to raise the rates so that some employment could be given to persons, not really required, but for whom means of subsistence had to be found and the Lieutenant-Governor has lately sanctioned such increase as may be necessary in the rates fixed to admit of all persons capable of working as carriers but not diggers being taken on.

Cost of Works in the Gorakhpur and Azamgarh Districts for February 1897.

C. W. ODLING,

Secy. to Govt., N.-W. P. and Oudh,
Public Works Department.

Cost of earthwork by Famine Relief Workers.

Note by C. G. Palmer, Esq., M.I.C.E., Additional Superintending Engineer, Famine Relief Works, 3rd Circle, Provincial Works, North-Western Provinces and Oudh, dated the 5th April 1897.

The question is raised in the Bengal rates communicated in the papers which are attached to the Government of India letter No. 927-F., dated the 25th March 1897, addressed to the Secretary to Government, North-Western Provinces and Oudh, Scarcity Department.

2. A pamphlet on "Tasks for Famine Relief Workers," by the Chief Engineer of Bengal, is the basis for the tasks. These are primarily based on a rate of Rs. 1-2 per 1,000 cubic feet for soft earth with a "lead" of 50 feet and "lift" of 3 feet with ordinary labour. The rate is extraordinarily low. I know of no part of these Provinces where even silt clearing can be done at that rate. The lowest rate with that lead and lift would be Rs. 1-8 in the North-Western Provinces.

3. The method of working out the various rates for different soils is to allow enough diggers for each class of work and add the requisite number of carriers, then to credit a proportionate quantity of the whole work to each man, woman and child engaged on it. This introduces some confusion of thought in dealing with the subject and obscures the real facts, which are, that the whole work is dug by the digger, and no one else has any hand in digging the "task," but the digger must have as many carriers as are required for the quantity he can dig. I think it can be better put in another way.

4. The working postulates of the pamphlet consist of certain *data* stated in relation to ordinary labour.

(i) With a lead of 50 feet and lift of 3 feet, the whole carriage of 1,000 cubic feet of earth can be done by 3 women and 3 children.

(ii) A child may be considered to carry three quarters as much as a woman.

(iii) Three annas should be added to the earthwork rate for the cost of additional carriage involved in every addition of 50 feet to the lead or of 3 feet to the lift.

(iv) Famine labour is able to perform three-fifths of the task of ordinary labour.

(v) The task of excavation only, for diggers, should be—

Soil.	CUBIC FEET PER DIEM.			Remarks.
	Ordinary Labour.	Under Famine conditions.		
	Full.	Full.	Low.	
Soft or sand	330	200	170	When women are employed as diggers they should do $\frac{2}{3}$rds of the task of a man.
Medium	200	130	100	
Hard	143	85	55	

From these we get two corollaries :—

(vi) Applying postulate (iv) to postulate (i) we get that with famine labour 5 women and 5 children are required for the carriage of 1,000 cubic feet, up to a lead of 50 feet and lift of 3 feet.

(vii) Applying (iv) and (ii) to (iii) we get that supposing the extra 3 annas for additional lead or lift with ordinary labour to mean 1 woman and 1 child, then with famine labour we must have $\frac{7}{4} \times \frac{5}{3} = \frac{35}{12}$ of a woman added to the carriers for every additional 50 feet lead or 3 feet lift. In practice, say 2 women and a child.

5. As regards the tasks of postulate (v) in my opinion those of the soft and medium soils are far too high unless it is clearly understood that "soft or sand" is practically *sand*, and the "medium" is what is called "sandy loam" in the North-Western Provinces Rules, paragraph 47. With this provision the Bengal tasks are practically identical with those of the North-Western Provinces; but the latter have no task laid down for sand.

6. The present note is written in connection with the famine relief works of the Allahabad Revenue Division, comprising the districts of Allahabad, Fatehpur, Cawnpore, Banda, Hamirpur, Jhansi, and Jalaun. Excepting Cawnpore and the northern parts of Allahabad the whole of this country is in the trans-Jamna Bundelkhand tract. In that tract the prevailing soil is black-cotton soil, or Kabar, or the underlying Rankar, or Moorum. Black-cotton soil in its dry condition is tough and hard beyond any other soil I have experience of. Kabar is hard but less tough and Rankar is filled with small stones. Moorum is practically an earthen rock. Most of the soil in Cawnpore and Northern Allahabad is a very hard clay. By far the greatest part of the work is located in the Bundelkhand tract. The tanks we are digging deeper are dead dry, most of them were merely wetted during the last rainy season and are now as hard as any other part of the ground. We are thus working everywhere in very hard soil, and for the purpose of relief works in the Allahabad (Revenue) Division it is only necessary to examine the results of applying the above postulates to the hardest class of soil.

7. Doing this, we obtain the following rates and figures :—

I.—*1,000 cubic feet of road work: hard soil: task per digger 55 c. ft. 10 seer rate of wages.*

	Rs.	A.	P.
18 diggers at 7 pice each	1	15	6
5 women at 5 pice each	0	6	3
5 children at 3 pice each	0	3	9
Total cost	2	9	6

This would leave all the lumps unbroken and the road a mere spoil bank of rough clods. It would give employment to 10 women and children for every 18 strong men fit to dig in very hard soil.

II.—*1,000 cubic feet of tank deepening. Task and wage rate as before, mean lead nearly 200 feet.*—In deepening tanks the spoil is cast on or beyond existing spoil banks on three sides of the tank, and the mean lift is about 15 feet.

		Rs.	A.	P.
	18 diggers at 7 pice each	1	15	6
	5 women at 5 pice and 5 children at 3 pice	0	10	0
Add for 150 ft. additional lead.	6 women at 5 pice	0	7	6
	3 children at 3 pice	0	2	3
Add for 12 ft. additional height.	8 women at 5 pice	0	10	0
	4 children at 3 pice	0	3	0
	Total cost	4	0	3

This would give occupation to 31 women and children for every 18 strong men fit to dig in very hard soil ; and the carriers could not do the work.

8. In the road rate the work would not be completed, but only earth thrown up in lumps. In the tank rate the allowance of carriers is altogether insufficient, as the following calculation shows :—

9. The carriers allowed are 19 women and 12 children. On the basis of each child doing $\frac{3}{4}$ths of a woman's work the children would be equal to 9 women ; and the carriers allowed would thus be equal to $19 + 9 = 28$ units of women carriers. Earth weighs 120 lbs. per cubic foot. Supposing each such woman carried 25 lbs. of earth at each trip (a very full allowance for weakly people), the 28 units would have to make $\frac{120,000}{25} = 4,800$ trips in the day, or on an average each unit would make 172 trips in the day. Each trip would involve going laden 200 feet in length and 15 feet height, and returning the same unladen. The whole carrying to be done by each famine worker woman would thus amount to walking a little over $6\frac{1}{2}$ miles laden, climbing a hill 2,580 feet high still laden, descending a hill 2,580 feet high unladen, and then walking back a little over $6\frac{1}{2}$ miles unladen. The weakly famine woman would thus have to walk in all more than 13 miles a day over a hill 2,580 feet high in the middle, and carrying a load of 25 lbs. to the top of the hill.

10. Taking another view of it. Even on tank-work of this description the allowance of carriers is only 31 women and children to 18 diggers. In the Public

Works Department Relief Works of the Allahabad Commissionership the average number of workers attending for the week ending 27th March (exclusive of all dependants, *i.e.*, adults too feeble to work in any way, and all children under seven years of age) were 129,362 men, 173,780 women, 112,177 children over seven years of age, in all 415,319 persons. They were formed into 7,000 gangs very nearly, thus using 7,000 of the men as "mates;" quite 8 per cent. of the men are unfit to dig even in medium soil and over 5 per cent. are taken up in the miscellaneous gangs for water arrangements, conservancy, etc.; the remainder may be counted as possible diggers.

We thus get total number of men ...		129,362
Deduct—		
Mates of gangs	7,000	
8 per cent. unfit to dig	10,349	
5 per cent. miscellaneous work ...	6,468	
		23,817
Balance useable as diggers ...		95,545

On the basis of 31 women and children to every 18 diggers in tank there would thus be employment for $\frac{95,545 \times 31}{18}$ = 164,590 women and children; but we had 285,957 of them, so that over 120,000 would have been left without employment.

11. Another point of these rates is that they entirely leave out the wages of mates, special gangs, dressing gangs, and all other persons not actually engaged on the task work: this alone makes a considerable difference in the apparent cost of work.

12. The system in the North-Western Provinces is altogether different. Work has to be found for all women and children fit to work that come for relief. As in the above example taken from the week ending 27th March 1897, there are about 95,500 men, whom it would be possible to employ as diggers, to about 286,000 women and children. Many of the women are weakly, many of the children are not much over 7 years of age; in all there are almost exactly 3 carriers to every possible digger: many of the possible diggers are not fit to dig hard earth, and so are set to carrying, and paid as carriers. Then in road work there are, as a rule, 3 carriers to every digger, and these also break up the clods and rough dress the road, the final dressing being done by special gangs; while in tank work there are, as a rule, 4 carriers, little and big, to every digger.

13. The following analysis of 30 gangs on tank-work near Meja (South Allahabad) as they stood on 27th February shows what the minimum rate must be with a task of 60 cubic feet and wages on the 10 seer basis.

Analysis of 30 gangs from the gang-registers.

Class.	No.	Rate per day.		Amount for one day.			
		A.	P.	Rs.	A.	P.	
Mates	30	2	3	4	3	6	
Men diggers	379	1	9	41	7	3	
Men carriers	160	1	3	12	8	0	
Women carriers	823	1	3	64	4	9	
Children, class I.	202	1	0	12	10	0	12 to 16 years.
Children „ II.	225	0	6	7	0	6	7 to 12 years.
Total	1,819	Average per worker unit in pies, 15·00.		142	2	0	

14. There are thus 1,410 carriers, little and big, to 379 diggers, or in the proportion of 3·72 to 1. If the whole of the 379 diggers completed their task of 60 cubic feet they would dig 22,740 cubic feet in the day, and the cost of the work would be almost exactly Rs. 6-4 per cubic feet. This rate would be for the gangs entirely employed on task work and would exclude the workers necessarily employed on water-supply, conservancy, dressing up work, etc., etc., as well as the pay of moharrirs and other establishment. In the north of Allahabad the task is 85 feet in tanks and 100 feet in roads, and the rate of wages is on the 12 seer basis, and there the minimum cost of earthwork would work out to a lower rate, but unfortunately three-fourths of the relief attendants of Allahabad are in the tract south of the Jumna : and in Banda, Hamirpur, and Jhansi a still greater majority are under conditions similar to those south of Allahabad. I think there is some error in the Cawnpore figures and will look into the matter. The other rates are reasonable.

15. The Bengal accounts show the wages of workers on task-work separatelu from the others, and as a means of obtaining the bare cost of the task-work it has advantages ; if it is considered desirable I can have that system introduced at an early date.

16. The rate of the work done can be kept down by increasing the proportion of diggers wherever possible, and exacting digging tasks from the additional diggers ; but this cannot be done to any large extent as the ground is so very hard and so many of the men are weakly. A weakly man being proportionately much more ineffective in hard soil than in soft.

17. The tasks in force have been the subject of frequent experiment. We began with larger tasks, but have been driven to the lower ones by the proved incapacity of the diggers to do more. In the south of Allahabad we began with tasks of 90 cubic feet for strong men, but they could not do it: we are now getting the full 60 cubic feet almost everywhere, and at present cannot get more. Similarly, in other places, with a sandy loam, like that of Ballia for instance, the men could do more than double the work ; but the soil we have to deal with is of very different texture, and our experience is that if the task is fixed within the capacity of the men they will make an effort to complete it ; but if it is beyond their capacity they do not try to do as much as they could ; because the fines for short work bring their wages down so close to *minimum* rates that the difference is not worth working for. In effect, they do less work with a disproportionate task than with one that is within their power ; the work really done is a little dearer, and at the same time the incessant fines cripple the main object of the work ; which is, to afford effective relief to those who require it, and will work for it. This is the main object of all relief work and it must not be lost sight of in the procedure adopted for giving relief.

Note by Colonel R. R. Pulford, R. E., Superintending Engineer, 2nd Circle, Public Works, regarding earthwork rates on Famine Relief Works.

It may be well to state at starting that the conditions under which famine earthworks are carried out, are in themselves so entirely distinct and different from those under which regular earthwork on a large scale is ordinarily carried out, that it is not strictly correct to compare one class with the other, in respect of cost of execution.

Starting, however, with the rates usually in force under ordinary conditions, the following may be taken as typical rates for earthwork executed by contract on large railway banks. The chief contractor gets Rs. 1-12 per 1,000 cubic feet for earth dug and placed in bank up to a height of 4 feet and with a lead of 1 chain. For every extra foot of height in the bank he gets 1 anna per 1,000 cubic feet, and for every extra 100 feet of lead he gets 8 annas per 1,000 cubic feet.

The first contract is, as a rule, sublet amongst a number of petty contractors at Rs. 1-6 the 1,000 cubic feet and the other extras for increased lead and lift.

The actual workers get 2 annas per 100 cubic feet and a certain proportion (not the whole) of the extra allowances.

The men who work are professional workers and both men and women are of splendid physique. Two men or a man and a woman will, in moderately hard soil, dig and carry under the ordinary conditions about 250 cubic feet to 300 cubic feet in a day. To do this they scarcely ever cease working and use two baskets. As a result the two workers earn 5 annas to 6 annas between them, *i.e.*, they get 10 pice or 12 pice each. Now if the ordinary famine workers were put to do the same class of work, the digger, even at contract rates, would not be able to excavate more than from 100 cubic feet to 125 cubic feet and the carrier would not be able to carry more than from 50 cubic feet to 60 cubic feet. That is to say for every 100 cubic feet or 125 cubic feet we should require at least one fairly strong digger and two fairly strong carriers. The regular famine workers are, so far as my experience goes, not capable of digging in the Oudh soil more than 100 cubic feet, and the average may be taken at, say, 65 cubic feet to 70 cubic feet. This is to be taken as referring to people who are working on a daily wage for fixed full tasks, beyond which they cannot earn anything. If they do less than the full task, they can be and are fined. From what I have seen and heard however, there is a striking difference between men working for contract rates and without any fixed limit, as to what can be earned and men working "amani" or on daily wages. The former are prepared to earn as much as they can, and to work for it, the latter are content as a rule to earn the lowest wages possible after deducting fines. But it must be also noted that the ordinary famine worker would not consider himself competent to work on regular contract terms, whilst the professional *beldar* would hardly find it worth his while to work under Famine Code Rules and rates.

The rates which have been worked up to in Oudh vary largely. The lowest was obtained for a few days only whilst our intermediate system was in force at Kheri by which one digger on 6 pice and 1 carrier on 4 pice had to do 100 cubic feet. This gave a rate of Rs. 1-9 per 1,000 cubic feet exclusive of dressing. But the Commissioner objected, and rightly I think, that the ordinary people could not possibly do the task without an extra carrier on 4 pice. This is the intermediate system now ordinarily in force with the contract incentive of an extra pice all round, if a full extra 25 cubic feet are executed. But, as His Honour already knows, for localities really distressed even this scale is not sufficiently elastic to meet the cases of all comers who ask for relief in return for work. In Hardoi we have an example of a really distressed district, and here we have a task of only 50 feet being performed and that with difficulty. The daily wages for such a task after deducting fines would be about 18 pice = 4½ annas per 50 cubic feet = 9 annas per 100 cubic feet, or a rate of Rs. 5-10 per 1,000 cubic feet. When to this we add wages for Sundays, wages for days when the charge is moving and other ineffective charges, we easily reach a high total.

From a scrutiny of the numbers of all classes who have come to the famine works in Oudh, it appears that the following are approximately the proportion of each, *viz.* :—

Workers.	
$\frac{2}{10}$	Fairly strong men.
$\frac{1}{10}$	Weakly men.
$\frac{4}{10}$	Women fit for carriers.
$\frac{3}{10}$	Children under 16 and above 7 years.

Dependants.	
$\frac{1}{4}$	Of the workers chiefly children below 7.

That is to say for every able bodied digger 4 other workers of sorts have to be provided for. It is this proportion which I selected as the basis of the gang organisation in Oudh, and on which the actual rates on the regular famine works are based.

Taking an average task as actually executed throughout at 65 cubic feet, the full daily wages for this would be at a 10 seer rate.

1 Digger	7 pice.
2 Adult carriers	10 „
2 Children „	6 „
	23 pice, or

deducting 3 pice for fines, 20 pice per 65 cubic feet $= \frac{20 \times 1000}{65} = 308$ pice, or Rs. 4-13 per 1,000 cubic feet.

This would include dressing and making up the dividing ridge. Or in the case of clay being brought from neighbouring tanks as a surface dressing for the road, would allow of a lead of 2 chains.

The above seems a high rate, but if a 100 cubic feet task were performed the rate would work out to 10 × 23 pice = 57½ annas = Rs. 3·10. The daily cost per worker would be $\frac{230}{5}$ = 4 pice = 1 anna.

The above rates deal only with the actual workers, and take into account only working days.

If now we look at the following Bengal figures of the Muzafferpore District *viz.*:

Men.	Women.	Big children.	Small children.	Work done.	Cost.
		Kutra Circle.		*Cubic feet.*	Rs. a. p.
33,787	6,053	3,350	1,267	363,900	3,595 14 0
		Excavation--Satyan Bata.			
11,014	2,318	1,562	443	1,369,332	1,243 6 9

we shall notice a very remarkable difference between them and those of Oudh. Whereas in Oudh out of 10,000 workers there would be :—

2,000 able-bodied diggers,
1,000 weak men carriers,
4,000 women carriers,
3,000 children carriers.

In Bengal the numbers would be :—

7,500 able-bodied men,
1,500 women,
1,000 children,

and in the case of the wonderful rates of less than 1 rupee per 1,000 cubic feet in the Muzafferpore District the workers would be divided into 1 digger and 1 carrier calculating from those rates each party of 2 must have dug and carried at least 180 cubic feet. For this amount of work the digger and carrier would earn 10 pice between them, probably divided in the proportion of 6 pice the digger and 4 pice the carrier. As nothing is said about the wives and children of the men workers who so largely preponderate, they must be cared for elsewhere.

No. 1270 OF 1897. Dated Naini Tal, the 2nd June 1897.

From the Secretary to Government, N.-W. Provinces and Oudh, to the Secretary to the Government of India, Revenue and Agricultural Department (Famine).

SIR,

Scarcity Dept.

I am directed to submit Famine Statements A and B for these provinces, which give details of the relief operations up to 24th April 1897 in eighteen districts officially recognised as distressed, and *extra*-Code Statement C, which contains particulars in regard to the districts under observation though not officially declared to be distressed.

2. Besides the amounts of advances under the Land Improvement and Agriculturists Loans Acts and of revenue suspensions shown in columns 11 to 13 of Statement B, Rs. 8,54,271 have been advanced under the two Acts and revenue to the amount of Rs. 20,23,225 has been suspended in the districts included in Statement C since 1st November last. These figures, though to some extent incomplete, approximate more closely to actuals than any hitherto obtained.

I have the honor to be, &c.,

T. STOKER,

Secy. to Govt., N.-W. P. and Oudh.

NORTH-WESTERN PROVINCES AND OUDH.

Monthly Famine Statement A for the four weeks ending Saturday evening, the 24th April 1897.

REMARKS TO ACCOMPANY FAMINE STATEMENT A FOR THE FOUR WEEKS ENDING SATURDAY EVENING, THE 24TH APRIL 1897.

AGRA DISTRICT.

1. *Private relief, village and poorhouse relief.*— Private subscriptions amounted to about Rs. 740 in addition to Rs. 2,300 already collected; and Rs. 500 was received from the Indian Famine Charitable Relief Fund. The Commissioner also received Rs. 5,000 for the relief of drugget makers. Private subscriptions are devoted chiefly to house to house relief in Agra city, to which object also a Government subvention is made. Village relief is distributed at the cost of Government by Civil Officers. Four poorhouses were open during the month.

2. *General character of relief works.*—Intermediate works under the Public Works Department, but four works are being carried out under section 65 (*a*) and advances have been sanctioned for 21 more.

3. *Physical condition of the people.*—Fair. In collecting lately some photographs for the Indian Famine Relief Fund, I have been greatly struck by the absence of emaciated persons. There has lately been an outbreak of cholera on the relief works in Agra, resulting up to date in 12 seizures and seven deaths. The work is being temporarily closed, and the workers drafted off to other works.

4. *Deaths due to starvation.*—None.

5. *Food stocks and importation of grain.*—Stocks sufficient.

6. *General condition and prospects of affected area.*—The harvest being now over, hired labourers are returning to the works. The number of persons relieved rose from 17,000 to 24,000.

7. *Changes in rates of wages, &c.*—None.

ETAWAH DISTRICT.

1. *Private relief, village and poorhouse relief.*—A few wealthy men distribute charity daily or afford relief to the poor. In Act XX towns and the city relief is given from the funds raised from subscriptions. Relief is also given in the district partly from these funds and partly from Government funds. There is one poorhouse at the headquarters of the district, in which the number of inmates on 24th April 1897 was 106.

2. *General character of relief works.*—The numbers on the relief work, Etáwah-Kálpi road, on 24th April 1897, were 1,522. More people are expected to come back on relief work, as the harvest is nearly completed.

3. *Physical condition of the people.*—The condition of the people is generally good.

4. *Deaths due to starvation.*—No deaths reported from starvation.

5. *Food stocks and importation of grain.*—Food stocks sufficient, and imports considerable.

6. *General condition and prospects of affected area.*—The affected area in this district is chiefly the trans-Jumna and Chambal tract, which is entirely dependent on the next autumnal crop. *Kharíf* harvest was poor, and *rabí* almost *nil* in this area.

7. *Changes in rates of wages.*—Rates of wages for agricultural labour have fallen everywhere in the district, except in villages favoured with irrigation.*

CAWNPORE DISTRICT.

1. *Private relief, village and poorhouse relief.*—Decrease in numbers relieved under Famine Code due to the harvest.

* It would seem that, instead of rising with price of food, wages have fallen owing to the competition for employment.

2. *General character of relief works.*—Road works under Public Works Department. Labourers in fair condition. Wages sufficient. Numbers keep down because harvest has lessened distress, and in south-east of the district the *mahua* crop is very large. Two tanks being constructed as works under section 65 (*a*) out of partly recoverable advances. Other applicants for advances are waiting till agricultural work is over before starting.

3. *Physical condition of the people.*—Much improved.

4. *Deaths due to starvation.*—Nil.

5. *Food stocks and importation of grain.*—Food stocks sufficient. trade brisk. Export slack.

6. *General condition and prospects of affected area.*—The general opinion of the people is expressed in the words "*Wuk bat ab nahin rahi.*" They mean that severe distress is past. It was generally expected that the numbers on works would increase before this, but there seem no signs of any influx. If the same state of things continues till May 15th, no great increase in numbers need by expected.

7. *Changes in rates of wages, &c.*—The intermediate system was introduced at the beginning of the month. The fact that labourers come in diminished numbers to works on this system is evidence that the distress is not so severe as it was before the harvest.

Fatehpur District.

1. *Private relief, village and poorhouse relief.*—Village relief system in full operation. Management of poorhouses is satisfactory. The local subscriptions and the amount received from the Executive Committee, Indian Famine Charitable Relief Fund, are administered by local committees.

2. *General character of relief works.*—Large relief works are under the management of the Public Works Department. There has been a decrease in the number of workers owing to the *rabi* harvest and *mahua* collection and also to the introduction of the intermediate system.

3. *Physical condition of the people.*—Generally good.

4. *Deaths due to starvation.*—*Nil.*

5. *Food stocks and importation of grain.*—Supplies sufficient. Importation moderate.

6. *General condition and prospects of affected area.*—General condition stationary. *Mahua* crop has improved the prospects of affected area.

7. *Changes in rates of wages, &c.*—The intermediate rates prescribed in Government Resolution No. $\frac{753}{S.-73}$, dated 16th March 1897, introduced from 1st April 1897.

Banda District.

1. *Private relief, village and poorhouse relief.*—Relief Committees of District and Municipal Boards' members and others have been formed. Rupees 8,273-4-5 were spent during the period from 1st to 15th April 1897 in supplementing village and poorhouse relief and in affording relief to respectable families in the district. The total number of persons relieved under Chapters V., VIII., and X. on the 24th April 1897 was 25,289, 2,446, and 1,936 respectively as against 22,752, 2,778, and 1,934 on the last day of the preceding four weeks ending 27th March 1897, and the total expenditure under these heads was Rs. 31,555-10-8, Rs. 5,954-12-3, and Rs. 2,268-9-9 as against Rs. 31,314-7-4, Rs. 7,501-7-10, and Rs. 2,569-12-3 during the preceding four weeks. Five hundred and fifty-five persons were relieved by the police under Chapter XIII. during the period under notice, to whom Rs. 43-2-0 were paid.

2. *General character of relief works.*—The character of large relief works under Public Works Department agency consisted of special repairs to existing roads, excavation and deepening of tanks, and breaking of stone at a quarry; and that of works under the District Officer was excavation of village tanks and embankments.

3. *Physical condition of the people.*—The condition of workers and that of the poorhouse inmates is generally fair. Cholera broke out on the works in parganas Baberu and Girwan, but in mild form, was promptly taken in hand, and has practically ceased. There was also some small-pox. Cases were treated in isolation hospitals.

4. *Deaths due to starvation.*—There were no deaths directly due to starvation reported during the month.

5. *Food stocks and importation of grain.*—Market supplies are sufficient. About 56,600 maunds of grain were imported into the district during the period under notice. There is thus no fear of the food stock running short for the present.

6. *General condition and prospects of affected area.*—The condition of the people had slightly improved, as the *mahua* crop was good in most places, but its effect did not last long, and the numbers are again rising.

7. *Changes in rates of wages, &c.*—The scale of wages was reduced from 8 to 7 pice downwards with effect from 28th March 1897 on a 10-*ser* basis.

Hamirpur District.

1. *Private relief, village and poorhouse relief.*—Ordinary private relief much contracted. From the Charitable Relief Fund doles for comforts were made to children in poorhouses and on village relief, and allowances supplementary of their own resources were made to 6,810 respectable people. Clothing is being given from the same fund. Village relief is distributed by respectable zamindárs. Poorhouses are managed by hospital assistants under the Civil Surgeon.

2. *General character of relief works.*—There are fourteen large relief works in progress, mainly excavation of tanks. Road works are being brought to a close. The excavation of 43 small tanks as village works was in progress.

3. *Physical condition of the people.*—Generally fair and at relief works good. Adequate measures have been taken in good time, and the death rate for April was almost down to normal.

4. *Deaths due to starvation.*—No deaths from starvation reported.

5. *Food stocks and importation of grain.*—Food stocks somewhat replenished by a scanty harvest, but still low. Importations continue by rail and road. Supplies sufficient.

6. *General condition and prospects of affected area.*—The entire district is suffering severely from the scarcity. The *rabi* harvest being over and the *mahua* harvest nearly so, numbers on relief are increasing and will probably reach 150,000 in May.

7. *Changes in rates of wages, &c.*—A rate of 10 *sers* is still adhered to in calculating wages, and prices do not suggest any change from this.

Allahabad District.

1. *Private relief, village and poorhouse relief.*—Private charity is not exerting itself, chiefly because funds are low, and also because Government and the Charity Fund are doing so much. The Charity Fund provides additional relief to nearly 20,000 people, mostly of superior status. The Government has charged itself with the support of the very poor. The poorhouse population has fallen. Poorhouses are now worked as merely temporary refuges, and their inmates are periodically drafted off to works or village relief.

2. *General character of relief works.*—South of the Jumna they have been split up into small works, an arrangement which is greatly appreciated by the people, since it provides work near their homes. In the Doába works are under the Famine Code, and are large works. North of the Ganges the intermediate system has been introduced.

3. *Physical condition of the people.*—Much improved. There is a marvellous difference between the condition of the trans-Jumna people now and their condition of three months back.

4. *Deaths due to starvation.*—Two reported, but unverified, and the reports cannot be trusted.

5. *Food stocks and importation of grain.*—South of the Jumna the people are entirely dependent on importation for their supplies. The traffic is sufficient to supply their wants.

6. *General condition and prospects of affected area.*—Prospects are favourable. There will be, I expect, a further increase in the numbers on relief: but this will occasion no difficulty or derangement.

7. *Changes in rates of wages, &c.*—South of the Jumna wages are calculated on a 10-*ser* basis. North of that river a 12-*ser* basis has till recently been accepted. It has been changed to 11 *sers* in the case of the Doába tahsils.

JHANSI DISTRICT.

1. *Private relief, village and poorhouse relief.*—Charitable relief and village relief under section 54 are being regularly distributed with good result. The numbers in poorhouses tend to fall.

2. *General character of relief works.*—The larger works are being replaced to a certain extent by works under section 65 (*a*), of which there have been a number opened.

3. *Physical condition of the people.*—Fair and, if anything, improving.

4. *Deaths due to starvation.*—None found due to starvation on verification.

5. *Food stocks and importation of grain.*—Ample. Importing going on steadily.

6. *General condition and prospects of affected area.*—General condition of affected area is poor. *Rabi* reaped was a fair return on the cultivated area, but the latter was very small. *Mahua* is an excellent crop and affording a means of livelihood to thousands, especially in Lalitpur. Prospects remain unchanged.

Changes in rates of wages, &c.—Prices remain high and have only fallen very slightly since the *rabi* harvest.

JALAUN DISTRICT.

1. *Private relief, village and poorhouse relief.*—Four poorhouses are open. Village relief is given in accordance with Chapters V and X of the Famine Code as well as out of the allotments made by the Charitable Fund Committee. There is very little other private relief.

2. *General character of relief works.*—Improvement of unmetalled roads and restoration of village tanks.

3. *Physical condition of the people.*—The physical condition of the people on relief works is, on the whole, satisfactory; in some places distinctly good. In villages the people are faring worse.

4. *Deaths due to starvation.*—None.

5. *Food stocks and importation of grain.*—Importation ensures a sufficiency of food stocks.

6. *General condition and prospects of affected area.*—The climax of the distress is now being reached. No abatement is looked for till the rains break.

7. *Changes in rates of wages, &c.*—No change.

MIRZAPUR DISTRICT.

1. *Private relief, village and poorhouse relief.*—During the month of April Rs. 5,050 was received from the Provincial Committee and Rs. 135 were locally subscribed: Rs. 9,347 was distributed in food and cloth relief, and 8,172 persons were relieved. The numbers in poorhouses have somewhat risen, and those fit for work will be drafted to works near their homes, while those unable to work, but having a home, will be drafted to their homes. Village relief is being properly distributed.

2. *General character of relief works.*—All the works are properly managed, and special attention is devoted to their sanitary condition.

3. *Physical condition of the people.*—Bodily condition of the people is so far good.

4. *Deaths due to starvation.*—No verified deaths have so far been reported.

5. *Food stocks and importation of grain.*—Supplies are sufficient and imports continue. Had it not been for the ring among the wholesale dealers, the prices would have been easier than they have been at Mirzapur.

6. *General condition and prospects of affected area.*—Numbers on works have lately risen and will rise further. There is little change in the general condition of the affected area.

7. *Changes in rates of wages, &c.*—The rates of wages are the same as in the past month, *viz.*, 12 *sers* north of Kaimur, and 10 *sers* south of it. No occasion has hitherto been found to lower the rates. The markets are closely watched, and in case of any sensible rise the rate will be lowered.

JAUNPUR DISTRICT.

1. *Private relief, village and poorhouse relief.*—Relief being given from the General Famine Fund. Village relief distributed weekly through *patwáris* and in municipality through members. Three poorhouses open.

2. *General character of relief works.*—All relief works now consist in digging and deepening tanks.

3. *Physical condition of the people.*—Much the same, that is, improved generally since the *rabí* ripened, but there are still evident signs of distress.

4. *Deaths due to starvation.*—No verified deaths from starvation.

5. *Food stocks and importation of grain.*—Food stocks appear to be ample, and since April 15th the net exports of grain have been large.

6. *General condition and prospects of affected area.*—These will not now be altered till the rains set in.

7. *Changes in rates of wages, &c.*—All works are now under the intermediate system.

GORAKHPUR DISTRICT.

1. *Private relief, village and poorhouse relief.*—These continue as when last report was furnished.

2. *General character of relief works.*—Intermediate works in progress. Some 65(*a*) works are in progress; more likely to be undertaken in coming month.

3. *Physical condition of the people.*—Materially improved.

4. *Deaths due to starvation.*—No deaths due to starvation.

5. *Food stocks and importation of grain.*—Stocks ample; export brisk; imports trifling.

6. *General condition and prospects of affected area.*—*Rabí* yield has been better on the whole than expected and general relief is felt, but, owing to high prices and consequent exports, there is still danger of a relapse. Rise in number on works has not been as great as I expected.

7. *Changes in rates of wages, &c.*—None.

AZAMGARH DISTRICT.

1. *Private relief, village and poorhouse relief.*—Village and poorhouse relief has been carried on during the month. Aid has been given from private subscription; money for clothes and for general aid.

2. *General character of relief works.*—Relief works have been roads, tanks, *kankar* collection on first class roads.

3. *Physical condition of the people.*—Has been satisfactory, all circumstances being considered.

4. *Deaths due to starvation.*—Have been *nil.*

5. *Food stocks and importation of grain.*—Food stocks are sufficient. Grain and rice have been imported. Wheat and barley have been exported. The grain merchants have been making extensive purchases.

6. *General condition and prospects of affected area.*—The affected area is doing as well as it could be expected to do. The numbers of persons on works and on gratuitous relief are expanding.

7. *Changes in rates of wages, &c.*—The rate of wages for digging on hard soil has been slightly raised, and is now very fair. I believe that the present wages give satisfaction to the labourers. As far as I have seen, this is the case.

Lucknow District.

1. *Private relief, village and poorhouse relief.*—Organization complete; numbers in the city are rising. *Parda nashins* who were not hitherto supported from Relief Fund and Government funds have been reduced to apply for assistance.

2. *General character of relief works.*—Road making, brick digging, tank construction, site levelling.

3. *Physical condition of the people.*—Good, prices being easier.

4. *Deaths due to starvation.*—None reported.

5. *Food stocks and importation of grain.*—Foreign importations have fallen off owing to the home harvest.

6. *General condition and prospects of affected area.*—Assistance must continue to be given till the rains set in, and village and city relief till the next harvest is cut.

7. *Changes in rates of wages, &c.*—Intermediate system in force over the whole district. Grain sells generally on the works for 12 *sers*, in a few instances at 11¼ *sers*.

Unao District.

1. *Private relief, village and poor-house relief.*—In some cases the customary doles were given at the threshing floors, but the numbers requiring gratuitous relief in the villages are increasing. Wanderers from other districts, chiefly from Fatehpur, are appearing at the poor-houses.*

2. *General character of relief works.*—There are six road works under the intermediate system. The introduction of this system, together with demand for havest labour, led to a large decrease in the number of workers. Since the 20th rapid increase has set in. Nine village works were started and employ 938 workers.

3. *Physical condition of the people.*—The cultivating class are in good condition. The cessation of field labour is affecting the labouring classes. On the works the condition of the labourers is fair except on the Auras work, where it is bad. Ten per cent. of the labourers there earn under four pice daily.†

4. *Deaths due to starvation.*—*Nil.*

5. *Food stocks and importation of grain.*—Exports by road to Cawnpore have commenced on a large scale.

6. *General condition and prospects of affected area.*—The *rabi* outturn over nearly half the district was under 30 per cent. of the normal, and distress, though not so severe as in February, will be acute. The map accompanying this report shows the areas affected. In the area shown as slightly affected, distress is only nominal.

7. *Changes in rates of wages, &c.*—The wages under the intermediate system are based on a 12-*ser* rate and remained unaltered during the month.

Rae Bareli District.

1. *Private relief, village and poor-house relief.*—Local and *tahsili* committees exist for relief from the Charitable Relief Fund, village relief (Chapter V) and relief to *parda nashins* being given. There are also four poor-houses.

2. *General character of relief works.*—Digging and Deepening of tanks, improvement of roads, and making of embankments. Intermediate system in

* The total number in the Unao poor-houses for week ending 22nd May was only 775.

† The relief works in this region have since been converted into works under full Code rules, with minimum wages and children's kitchens. Recent reports show that the condition of the people is now satisfactory.

force under Public Works Department. Kitchens to feed children opened recently on works.

3. *Physical condition of the people.*—In the affected tracts, fair; on works, good.

4. *Deaths due to starvation.*—None reported.

5. *Food stocks and importation of grain.*—Believed sufficient for local consumption. Importation of grain has considerably fallen.

6. *General condition and prospects of affected area.*—Condition improving on the whole. The *rabí* is now out of the threshing floors; prices slightly easier.

7. *Changes in rates of wages, &c.*—None from what prevailed at the end of March 1897.

SITAPUR DISTRICT.

1. *Private relief, village and poor-house relief.*—Rupees 4,150 has been advanced for purchase of clothes during the month. Cloth is being purchased from *juláhas*, who thereby get work. Under village and poor-house relief the number has fallen from 6,214 on 27th March to 3,999 on 24th April 1897.

2. *General character of relief works.*—None re-opened till 15th April 1897.* Reports received state that few labourers join, and most of these leave when they understand the new system. Some of them went on to a Hardoi work under the ordinary system.

3. *Physical condition of the people.*—Seems fairly good. I have not noticed any bad cases during the last three weeks.

4. *Deaths due to starvation.—Nil.*

5. *Food stocks and importation of grain.*—Markets well supplied with *rabí* grain. *Kharíf* grain scarce. Grain is being freely exported.

6. *General condition and prospects of the affected area.*—The general outlook is more favourable than was expected. Until the middle of May there will probably be little pressure on the works. Village works do not seem to attract labour.

7. *Changes in rates of wages, &c.*—There is no marked change in the price of the staple. Wages now depend on the work done.

HARDOI DISTRICT.

1. *Private relief, village and poor-house relief.*—(*a*) A local committee has been formed to administer funds remitted by the Provincial Committee as well as those realized locally, and the distribution of relief from these funds has already been started.

(*b*) Village relief is administered by the special officers appointed for the purpose, and the lists undergo careful constant scrutiny.

(*c*) There are four poor-houses—one at the headquarters of each tahsíl.

2. *General character of relief works.*—Construction, raising and repair of roads, and the repairing of tanks [section 65(*a*)].

3. *Physical condition of the people.*—The physical condition of the people has improved, though not to any great extent.

4. *Deaths due to starvation.*—None reported in April. One case that occurred in the preceding month was reported to Government in this office No. 2924, dated 14th April 1897.

5. *Food stocks and importation of grain.*—Food stock sufficient. Imports practically *nil.*

6. *General condition and prospects of affected area.*—The harvesting operations of the *rabí* are completed, and the labouring classes are now returning in large numbers to the relief works. It will be necessary to maintain relief works at any rate until the fall of the rains.

7. *Changes in rates of wages, &c.*—Private wages stationary. Those on relief works are regulated according to the Famine Code.

* Before the Holi the works were under Full Code rules. After the Holi they were converted to the intermediate system. During the Holi holidays the works were entirely deserted.

BENGAL.

From M. Finucane, Esq., Secretary to the Government of Bengal, to the Secretary to the Government of India, Revenue and Agricultural Department. Agriculture—No. 1132 (*Fam.*). *Calcutta, the* 15*th April* 1897.

SIR,

In continuation of this Government's letter No. 778 Agri. (Fam.), dated the 18th March 1897, I am directed to submit the following report, under section 29 of the Bengal Famine Code, on relief operations in Bengal during the four weeks ending the 27th March 1897. I am also to enclose herewith copies of the half-monthly reports* of the Commissioner of the Patna Division, No. 812F.G., dated the 22nd March, and No. 912F.G., dated the 7th April 1897, and their enclosures, together with maps of the Patna Division and of the districts of Palamau, Manbhum, Nadia, Khulna, and Bhagalpur, showing the tracts now affected.

2. There was distress requiring relief measures on a large scale in the Shahabad, Saran, Champaran, Muzaffarpur and Darbhanga districts of the Patna Division. The condition of the Patna and Gaya districts continued to be satisfactory; throughout both districts three-fifths to half an inch of rain fell on the 23rd and 28th March. This rain did no appreciable harm to the *rabi*, but on the other hand, refreshed the standing crops and enabled ploughing to go on, as well as the preparation of seed-beds for the early rice. The *rabi* crops are expected to yield in these districts a 16-anna or full average outturn. No relief works were open in these districts. Gratuitous relief was given from funds privately subscribed or allotted by the Provincial Committee of the Indian Famine Charitable Relief Fund. There was also a poor-house in Bankipore, in which the daily average number of persons relieved was about 60, half of whom had come from the North-Western Provinces. In Gaya kitchens were open along the Grand Trunk Road and elsewhere; the prices of wheat and barley had fallen, while those of rice were stationary. The Commissioner thinks that this district will require little or no outside aid.

The following paragraphs deal with the principal features of famine relief in the other and seriously affected districts of the Patna Division.

3. *Rainfall and prospects of the crops.*—The rainfall during the month and in March 1874 was as follows:—

		March 1874.	March 1897.
		Inches.	Inches.

	Samastipur	0·08	0·90

* Not reprinted.

The rainfall during the first-half of the month was slight and scattered. On the 22nd, 23rd and 24th March there was rain all over the Division ; it was heaviest in Darbhanga and parts of Champaran and lightest in Saran. The greater part of the *rabi* crops had already been harvested, and the rain therefore did no damage, except in the north-east of Champaran, where the *rabi*, which had been sown late, and the poppy were damaged by hail. On the other hand, the rain has enabled cultivators to plough their lands for the early *bhadoi*, and has done good to millets, sugarcane and cotton on the ground, and has to some extent improved the prospects of the indigo. The Commissioner expects a full *rabi* crop in Saran and in Shahabad (except in the Bhabhua subdivision, where it is estimated to be about 6 or 7 annas) ; he expects an outturn of 10 annas in Champaran, 11 annas in Muzaffarpur, and 12 annas in Darbhanga. In 1873–74 the outturn of these crops was in Shahabad 16 annas, in Saran 7 annas, in Champaran 8 annas, in Muzaffarpur 10 annas, and in Darbhanga 8⅔ annas.

Estimated area and population affected.—There was no change under this head in the district of Muzaffarpur.

Shahabad.—It is reported by the local officers that there has been no change in the affected area. But in the Famine Statement A an area of 1,351 square miles has been shown as affected, against 680 square miles previously reported. An explanation of this discrepancy will be obtained from the Collector.

Saran.—The total area affected in this district is now stated to be 1,684 square miles, with a population of 1,484,386 persons, against 1,442 square miles with a population of 1,352,000 previously reported. This increase is due to a general revision made by the Collector of his estimates of area affected. Relief works are now open throughout the Gopalganj subdivision, and the whole of this tract has therefore been classed as seriously affected ; an area of 19 square miles in the Sadar subdivision, in which the *rabi* has been very poor, has also been placed in this category.

Champaran.—The Collector of Champaran has again revised his figures as the result of a fresh calculation, but it is stated that there has been no actual change in the area in distress. The total area affected in this district is now put down at 2,593 square miles, with a population of 1,554,000, against 1,865 square miles with 1,110,000 persons previously estimated.

Darbhanga.—The area now shown as affected is 2,940 square miles against 2,766 square miles previously reported ; but no explanation of the increase has yet been furnished.

4. *Relief works.*—The progress made in the transfer of large works to the management of the Public Works Department has been slow, the number of works open in each district at the end of March being—

	Under the Public Works Department.	Under Civil Officers.	Total.
Shahabad	Nil	7	7
Saran	2	29	31
Champaran	21	59	80
Muzaffarpur	12	58	70
Darbhanga	(Not stated)	(Not stated)	134
Total	... ...	... ...	322

The total number of works open at the end of February was 254, of which 30 were under the Public Works Department and 224 under Civil Officers. The

following table shows the average daily number of adult male units on the Government relief works in each district in the second fortnight of March, compared with the numbers for the second fortnight of February :—

District.	Half-month ending 27th February.			Half-month ending 27th March.		
	Task-work.	Daily wage.	Total.	Task-work.	Daily wage.	Total.
1	2	3	4	5	6	7
Shahabad	698	143	841	3,613	285	3,898
Saran	8,563	2,353	10,916	7,419	1,057	8,476
Champaran	74,892	4,046	78,938	76,306	6,399	82,705
Muzaffarpur	17,792	1,191	18,983	17,365	2,072	19,437
Darbhanga	77,466	3,150	80,616	50,920	5,135	56,055
Total ...	179,411	10,883	190,294	155,623	14,948	170,571

The numbers in Shahabad have risen steadily, owing, it is reported, to the conclusion of the *rabi* harvest and to the return of labourers who had gone to seek work elsewhere. The falling off in the numbers of task-workers in Saran and Darbhanga is reported to be due partly to the rain and the consequent demand for agricultural labour, partly to the *rabi* cutting, and partly to other causes. The numbers of relief-workers employed irrespective of task increased, except in Saran, but were nowhere excessive.

The average reported outturn of work, cost-rate and wages were as follow :—

District.	Average daily wage of adult male unit.				Average outturn of work per adult male unit on task-work.		Cost rate per 1,000 cubic feet.	
	Second half of February.		Second half of March.		Second half of February	Second half of March.	Second half of February.	Second half of March.
	Task-work.	Irrespective of task.	Task-work.	Irrespective of task.				
1	2	3	4	5	6	7	8	9
	A. P.	A. P.	A. P.	A. P.	C. ft	C. ft.	Rs. A. P.	Rs. A. P.
Shahabad	1 10	2 1	1 9	2 0	49	42	2 6 5⅛	2 10 9
Saran	1 5	1 6	1 5½	1 10	50½	38·5	2 4 0	2 6 8½
Champaran	1 5½	1 9½	1 6¼	1 10	23¼	25·9	3 15 5½	3 11 0½
Muzaffarpur	1 4½	1 9½	1 4	1 8½	66·77	49	1 4 8	1 11 8
Darbhanga	1 5	1 7	1 4	1 7¾	32·6	31·3	2 11 5	2 11 11

There has been no great change in the average wages earned since the latter end of February. The causes of the slight variation in the outturn and cost-rate per 1,000 cubic feet are the same as those explained in paragraph 4 of the report for February. On the whole, the works were carried on smoothly and satisfactorily, but difficulty is still experienced in obtaining the establishment necessary for the strict enforcement of the prescribed tasks. None of the non-commissioned officers asked for in my letter No. 671 (Fam.), dated the 9th March 1897, have yet joined, and the Government of India are now being

requested to lend the services of 12 additional commissioned officers. The Lieutenant-Governor has also authorised the introduction of the piece-work system on the major relief works (*i.e.*, on canals and railways) so as to lighten the strain on the establishment.

5. *Private relief works.*—In the district of Shahabad several tanks were being excavated at the expense of private individuals, and over 6,000 labourers were employed on the Mogulserai-Gaya Railway. In Saran the Hatwa Raj had ten works open on which 4,117 labourers were employed on the 27th March. Besides these there were other private works open in the Gopalganj and Siwan subdivisions. There were no private works in the district of Champaran, except a tank which was being excavated by the Bettiah Raj, and which employed an average of 43 labourers daily. The Darbhanga Raj had works open in Muzaffarpur and Darbhanga. The number employed on the Raj works in the former district on the 27th March was 2,828, and in Darbhanga 16,687.

6. *Poor-houses, kitchens and village relief.*—There were 21 poor-houses open in March in the five districts, against 16 in February, while kitchen relief was given at several places in Muzaffarpur, Champaran and Shahabad. The Darbhanga Raj maintained a poor-house in Muzaffarpur and kitchens in Darbhanga. In Saran the Hatwa Raj maintained four poor-houses, and the Manjha zamindars one. Employment was given to *pardanashin* women in the form of cotton-spinning and basket-making.

7. *Gratuitous relief.*—The average daily doles of gratuitous relief during the second fortnight of March were as follows in comparison with the corresponding figures for February :—

	Second-half of—	
	February.	March.
	Pies.	Pies.
Shahabad	10	10
Saran	8	8
Champaran	9¼	10⅔
Muzaffarpur	10	9
Darbhanga	10	8⅖

The dole in Shahabad is high, because it was calculated on the basis of rice at 8½ seers per rupee. Gram and peas sell cheaper than rice, but are reported not to be always available. The dole was highest in Champaran, where it was higher than in the latter half of February.

The numbers on gratuitous relief increased considerably. In Shahabad the total number during the last week of March was 17,225, against 8,740, the corresponding figure for February, while the total number on relief works on 27th March was 6,215. The Collector writes that in his opinion the maximum has not yet been reached, and that he expects a further increase. In Saran the increase from 15,939 at the end of February to 27,319 at the close of the period under report is stated by the Collector to be due to his personal efforts to stir up the Circle Officers who were found neglecting the most patently deserving cases. The opening of more relief works is in contemplation, and when this has been done, many of the recipients of gratuitous relief will probably be drafted off to the relief works.

8. *Physical condition of the people, &c.*—The public health generally continued to be exceptionally good, and the condition of cattle is reported to have been fairly satisfactory. The death-rate in the affected portion of the district of Shahabad (3·39), though not very high in itself, is considerably higher than the registered rate (1·93) for the whole district, as shown in Famine Statement A

hereto annexed. It is stated by the Collector that the death-rate of this area is in ordinary years higher than that of the rest of the district, and that this year, while other parts of the district are healthy, small-pox and heavy fever mortality are reported from the distressed tracts.

9. *Loans.*—Loans for village works under the modified rules under the Land Improvement Loans Act do not appear so far to have proved attractive, but complete information is not yet in the possession of Government. The local officers have been asked to furnish fuller particulars under this head in future reports.

10. *Food-stocks, importation of grain, and prices.*—The total imports of the Division, including Patna and Gaya, during the period under report, are stated to have been 6,24,730 maunds, and the exports 1,58,643 maunds, against 5,51,769 and 1,84,456, respectively, in February. The imports exceeded the exports by 4,66,087 maunds, and a considerable portion of the former consisted of Burma rice. No deficiency in food-supplies has been reported from any of the affected districts of the Patna Division. Prices have remained steady.

11. *Chota Nagpur.*—The situation in the Chota Nagpur Division depended to a great extent on the *mahua* crop. That crop has been seriously damaged by rain and stormy weather in the lower-lying portions of Hazaribagh, in Palamau and in Manbhum ; in the district of Lohardaga, which is an elevated region, and on the plateaux of Hazaribagh, the damage done was less considerable. The poorness of the *mahua*, combined with the failure of the mango crop, may lead to more widespread distress than was anticipated, and prices are reported to have generally risen. Public health continued to be on the whole good, and the general condition of cattle appears to have improved, although cases of disease are still reported, while the rain that fell during the month will have the effect of increasing the supply of fodder.

Singhbhum and Lohardaga.

No report has been received from Singhbhum since the change in the weather, and exports being still far in excess of the imports, it is believed that there has been no change for the worse in the condition and prospects of this district. In Lohardaga, although no actual indications of distress have come to notice, prices continue to rise, exportation had stopped, and grain merchants had begun to import rice in considerable quantities and were selling it at 8 seers per rupee in the head-quarters of the district. There was rain throughout the district on the 21st, 22nd, 23rd and 24th March, the fall amounting to 1·13 inches at Ranchi, ·73 of an inch at Palkot, ·91 at Lohardaga, and 1·62 at Silli, and there has been further rain since the close of the period under report. The extent of the damage done to the *mahua* crop is not yet known. The poorer classes are beginning to feel the pinch of distress, and the local officers contemplate opening test-works shortly.

Palamau.

The total rainfall in Palamau during March is reported to have been 1·48 inches, and the outturn of the *mahua* crop is estimated at about 10 annas. The *rabi* crops have been seriously injured by rust and worms, and the outturn for the whole district is estimated by the Deputy Commissioner at 6 annas. Prices have risen higher than before, the price of rice being under 8 seers per rupee in many places. The relief works are not, however, attended by large numbers. At the end of February there were nine Government relief works open, with a total number of 4,287 labourers (men, women and children). The number of works has since been increased to 13, but the labourers employed on them numbered only 3,181 at the end of March. This fall in the numbers is attributed to the gathering of the *mahua*, but it also appears to show that the people must have greater resources than was supposed by the local officers. Several private works are open, but precise information of the numbers employed on them has not been furnished. The numbers on Government gratuitous relief increased from 514 at the end of February to 1,524 on the 27th March. The Commissioner thinks that this increase is what may be expected, as the continued rise in prices makes itself more and more felt by persons who are unfit for manual labour.

The Palamau Branch Committee of the Indian Famine Charitable Relief Fund have commenced operations, and at the close of the period under report,

were giving relief to 297 *parda-nashin* women, 88 respectable men, and 99 children, the daily rate being two annas per adult and one anna per child. They have also given supplementary relief to 46 others.

The offer of Government to pay a bounty of 8 annas for every maund of Burma rice imported has not had much effect. The total quantity of Burma rice imported up to the close of the period under report is stated to have been 1,803 maunds. The bounty has since been extended to country rice, and will be paid for all rice brought into the Palamau district up to the 30th April. The total amount of advances for village relief works in this district, sanctioned up to 27th March, was Rs. 32,700, and the total amount paid Rs. 11,096.

The Deputy Commissioner of Palamau reports that 16 persons came to Daltonganj from Singrauli in the Mirzapur district in a very emaciated condition. Some of them were sent to the hospital and some were given gratuitous relief.

Manbhum.

The *mahua* crop in Manbhum as elsewhere in the Chota Nagpur Division has been considerably damaged by the inclement weather during the latter half of March, the loss being estimated by the Commissioner at not less than 8 annas. Prices continued high, ranging from 8 to 10 seers. The area affected remained the same as previously reported, but of the 11 test-works which were open at the end of February, two were closed in the first half of March, as they failed to attract labourers. The total number on the nine remaining works on the 27th March was 3,459, against 3,492 at the close of February. When the report for the month of February was submitted to the Government of India, precise information had not been received as to the numbers on gratuitous relief. The number estimated by the Deputy Commissioner was 5,000. At the end of the period now under report, the actual number on gratuitous relief was 4,118. No precise information has been furnished of the amount advanced under the modified rules under the Land Improvement Loans Act.

Hazaribagh.

The hopes entertained of a full *mahua* crop in Hazaribagh have been falsified by the bad weather, and the outturn of this crop is now estimated at 12 annas. Prices, already high, show a tendency to rise. In places rice was selling at less than 8 seers per rupee. The ordinary works under the Public Works Department and the Road Cess Committee have been converted into test-works at a piece-work rate of Re. 1-9 per 1,000 cubic feet. During the last week in February the total number employed on these works was 1,136, which rose to 2,261 in the second week of March and 2,618 in the fourth week. Four kitchens were opened in the beginning of the month. The number was subsequently raised to 14, and the number of persons fed at these *kitchens*, as stated in the supplementary telegraphic report of 6th April, was 535. The system of giving relief to women and indigent artisans by cotton spinning and weaving was being steadily developed with successful results by the Hazaribagh Branch Relief Committee.

12. *Presidency Division.*—During the latter half of the month there was general rain throughout the Division which has considerably improved the prospects of the future: the mango crop is, however, reported to be poor everywhere. The position in the 24-Parganas was unchanged, food-stocks were sufficient, and no distress was apprehended.

Nadia.

In Nadia distress has extended to the eastern half of thana Tehatta, and the total area affected during the period under report was 927·75 square miles with a population of 478,612. Although the recent rain, which averaged over three-fourths of an inch throughout the district, has improved prospects, the present pressure has increased. The number of Government relief works (14) remained the same as before, but the total number employed on them on the 27th March was 10,641, against 6,873 at the end of February. Large numbers are said to have been employed on the excavation or re-excavation of tanks undertaken by private individuals, but precise figures have not been furnished. The numbers on gratuitous relief largely increased, being 11,399 at the close of the period under report. Public health continued to be exceptionally good, and the death-rate in

the affected area was lower than in the remainder of the district. The condition of cattle is also reported to have been good. Food-stocks were sufficient and prices were generally steady.

Khulna.

The affected area in this district is reported to have been the same as before, but distress has deepened, and the number of beggars and applicants for gratuitous relief is reported to have increased, notwithstanding that large numbers are being relieved by the local Committee of the Indian Famine Charitable Relief Fund. There has been rain throughout the district, the reported fall in the affected area being ·51 inch. This area ordinarily grows nothing but winter rice, but it is satisfactory that the people are taking advantage of the early rain to sow autumn rice and jute.

Four relief works were open in February, and the total number employed on them was 583. The number of works has since been increased to 16, of which 13 are tanks and three are roads. The total number of relief-workers on the last day of the period under report was 2,669, and the Collector writes that about 6,000 more are employed on works carried out by private individuals. The number on gratuitous relief has increased from 1,949 at the end of February to 4,090 at the end of March. Prices were generally stationary, and although the affected area depends on importation for its food-supply, no want of grain in the local markets has been reported; the condition of cattle was good. An outbreak of cholera has increased the death-rate in the distressed tract as well as in some of the other parts of the district in which there is no distress, but in which cholera prevails. This outbreak is attributed to the want of good drinking-water, for the supply of which several tanks are being excavated by Government as well as by private individuals, and the District Board is taking steps to sink ring-wells in the worst villages. Arrangements have also been made for two doctors to visit the affected villages with cholera medicines, and one of them is already on the spot.

It was reported last month that a man and a woman were alleged to have died of starvation. On enquiry it has been found that the man died of a disease which may have been due to insufficient food. The woman had no fixed residence and lived by begging. She did not come to the Circle Officer, and the *post-mortem* examination showed that her condition was such that in all probability no relief would have saved her life.

In this and some other districts of Lower Bengal women refuse absolutely to work on relief works, though their husbands who are respectable cultivators are working at less than half the wage earned by coolies in ordinary times. The result is that the Code wage being insufficient for the maintenance of the male workers and female members of the families, the numbers on gratuitous relief are disproportionately large. The Lieutenant-Governor has therefore authorised the introduction of the piece-work system at somewhat higher than the Famine Code rates, that is to say, the workers will be allowed to earn as much as they can, without a maximum limit, at somewhat higher rates for earthwork than those prescribed by Mr. Glass's tables.

Murshidabad.

The rain was general in Murshidabad and amounted to over an inch; it has slightly improved the condition of the affected tract in this district. Besides facilitating the preparation of land for the next *bhadoi* and winter rice crops, it has improved the prospects of the mulberry cocoon and of the *boro* paddy. It has also enabled the cultivators to sow a species of paddy known as *shati*, which takes 60 days to mature. Eight test works were open, and the total number of men, women, and children employed on them on the 27th March was 3,360. There was no regular organization for the distribution of gratuitous relief; but some relief of this kind was given through the agency of the police and of private gentlemen. Food-stocks were sufficient, and prices were generally stationary. Public health was, on the whole, satisfactory. The supply of fodder for cattle was sufficient, but in one of the affected thanas (Gowas) cattle-plague is reported to have broken out.

Jessore.

The district of Jessore has had the heaviest rainfall in the Division, the total fall from the 21st to the 30th March being—

	Inches.
Sadar	1·63
Jhenidah	3·18
Magura	3·98
Narail	2·74
Bangaon	2·66

The condition and prospects of thana Muhammadpur in the Magura subdivision improved, while anxiety with regard to Bangaon is stated by the Collector to be nearly at an end. The price of common rice is reported to have risen slightly, but food-stocks were sufficient. Public health and the condition of cattle were fair. Gratuitous relief was continued, the total number in receipt of such relief during the latter half of the month being 882.

13. *Bhagalpur Division.*—The affected districts in the Bhagalpur Division continue to be Bhagalpur and the Sonthal Parganas. In the other parts of the Division it is reported that there has been a gradual rise in the prices of all food-grains, notwithstanding the harvesting of the *rabi* crops and the recent rainfall, which is reported to have done much general good, but caused some slight injury to grain on the threshing floor, and more serious damage to the maturing *mahua* flower. The mango crop, which is of great importance in the districts of Malda and Bhagalpur and in the north of Monghyr, will, it is feared, be a failure.

Bhagalpur.

In Bhagalpur, actual distress is still confined to parts of the Madhipura and Supaul subdivisions in the north, comprising a total area of about 500 square miles with a population of 325,000 persons. The recent fall of rain, which amounted to 1·91 inches in Madhipura and 1·41 inches at Supaul, is reported to have done nothing but good in these tracks, inasmuch as it has given a great stimulus to field operations, and as there was little or no *rabi* that could be damaged by the rain in the fields or on the threshing floors. In consequence of this improvement in agricultural prospects, the numbers on Government relief, which had risen from 8,160 at the end of February to 18,027 on the 22nd of March, fell to 13,474 in the week ending 29th March. At the end of the period under report there were nine relief works open in the two subdivisions, against four in the latter half of February. The total number of relief-workers was 9,819. Several tanks were being excavated by private individuals, and it is reported that private charity and private relief-works are playing an important part as they have done in all previous seasons of scarcity in North Bhagalpur. Government gratuitous relief was given by grain doles at the end of the period under report to 3,394 persons. The physical condition of the people and the public health were good, and food-stocks were sufficient.

Two other tracts in this district are threatened with distress. One is an area of about 150 square miles in the Colgong thana of the Sadar subdivision, which contains purely rice lands with no low lands, with next to no *rabi*, and with no *mahua*. In this area the rice crop is estimated to have been 4 annas only. The other tract is the Katauria thana in the south of the Banka subdivision, in which it was hoped that the *mahua* crop would help the poorer classes. That crop has been considerably damaged by the rain, and the loss is estimated at from 4 to 6 annas. Both tracts are being carefully watched, and arrangements are ready to administer relief when needed.

Sonthal Parganas.

The distressed area in the Sonthal Parganas is 367 square miles with a population of 93,000 in the Jamtara subdivision. In this and other parts of the Sonthal Parganas the *mahua* flower is a great adjunct to the food-supply. It is

used by the people for one meal in the day, the other meal being of grain. The rainfall during the latter half of March, which amounted to 1·24 inches, damaged the *mahua*, and the outturn is now estimated at one-third of an average crop. There were four relief works open, the numbers employed on which aggregated 2,313 at the end of the period under report, while the number in receipt of gratuitous relief was 235. Public health is reported to have been unusually good. The cattle were in good condition.

Anxiety is felt for the southern portion of the Godda and the north and south of the Deoghur subdivision. Test-works were opened, but did not attract labourers. The *mahua* crop is reported to have given relief for the time.

14. *Orissa Division.*—Reports from Angul and Balasore continue to be satisfactory. No single instance of distress has come to notice in either district. In the district of Cuttack it was believed that there was distress in pargana Kuhunda-Jaipur, with an area of about ten square miles. A test-work was opened, but was not attended by any labourers. It is reported that there is abundance of work on the railway, but that the railway authorities have difficulty in securing labourers. This shows that the people are not now in need of relief. There was heavy rain throughout the district,* which has improved the prospects, and distress is reported to be confined to those who cannot work. For these a system of gratuitous relief has been organised; about 70 persons daily were in receipt of doles during the week ending 27th March 1897.

	Inches.
*Cuttack	5·78
Jajpur	2·66
Kendrapara	4·09
Banki	1·76
False Point	3·69

The staple crop of the district of Puri is winter rice, and this crop during the past season, was injured first by heavy floods in July and then again by drought, the monsoon rains having ceased entirely in the middle of September 1896. The estimated outturn of this crop for the whole district is 8 annas, but in some parts is reported to have been as low as 2 annas or less. The worst tract is an area of 250 square miles with a population of about 70,000 lying along the northern and eastern shores of the Chilka lake and comprising the parganas named on the margin. The soil is generally sandy and grows only one crop, and the people are always more or less in straits. It was in these tracts that the famine of 1866 first made its appearance. It is reported that there are no local stocks of food-grains, and steps have been taken to supply this deficiency by importation from other parts of the district. Government relief works have been in progress since January, and the Raja of Parikud commenced certain protective embankments as early as November 1896. The Commissioner, who recently visited the affected tract, reports that the people themselves did not say that they would require relief after the setting in of the rains, and he thinks that this statement may be relied on. During the latter half of March there was heavy rain, which in the affected tract amounted to 2·45 inches, and slightly improved the condition of the tract. Fifteen relief works and four tests works are reported to have been opened in or near the distressed area, and the total number employed on them at the end of the period under report was 4,204. In addition to these a District Board road running through Malud and Parikud employed a daily average number of 486 persons, and the works undertaken by the Raja of Parikud were in progress. Gratuitous relief was given to a daily average number of 75 persons. Public health and the condition of cattle were good.

Puri.

Bajrakote, Malud, Parikud, Andhari, Satpara, Manikpatna, Balbhadhrapur and parts of parganas Chowbiskud and Serari.

15. *Burdwan, Rajshahi, Dacca, and Chittagong Divisions.*—There is nothing of importance to report with regard to the Burdwan, Rajshahi and Dacca Divisions. The Commissioner of Chittagong writes that the only district in his Division which gives grounds for anxiety is Chittagong, but that in this district there has been general rain varying from 2 to 4 inches which has done good. The Commissioner reports that there is a tract along the sea coast in Satkania

and Banskhali in which certain classes feel decided pressure. There is sufficient rice in store, but it is stated that the means of purchasing it are wanting. The Lieutenant-Governor does not think that there can be any widespread distress in Chittagong, and trusts that such isolated cases of distress as may occur will be adequately met by the measures which the local officers are taking with funds locally raised or provided by the Provincial Committee of the Indian Famine Charitable Relief Fund.

I have, etc.,

M. FINUCANE,

Secretary to the Govt. of Bengal.

Monthly Famine Statement A for the four weeks ending Saturday evening, the 27th March 1897.

District.	Area.	Population in thousands.	Affected area.	Estimated population in thousands of area in column 4.	Numbers on relief works on last day of month.					Numbers on gratuitous relief. * The figures in columns 3 to 5 for Champaran include 73 miles of the proposed Railway from Bairagnia to Bagaha, which would give employment to about 14,120 persons for three months.

No. $\frac{1191}{7-14}$ F. Dated Simla, the 4th May 1897.

From T. W. Holderness, Esq., C.S., Deputy Secretary to the Government of India, to the Secretary to the Government of Bengal.

SIR,

In continuation of my letter No. 1115-F., dated the 23rd April 1897, I am directed to make the following observations on your letter No. 1132 (Famine), dated the 15th April, being the report on relief operations in Bengal during the four weeks ending the 27th March 1897.

2. The numbers on relief-works and in receipt of gratuitous relief on the last Saturday of the months of March and February in each district are shown in the following table, which has been compiled from Famine Statement A :—

Division.	District.	On 27th February 1897.		On 27th March 1897.	
		Relief-workers.	Number on gratuitous relief.	Relief-workers.	Number on gratuitous relief.

	Total ...	243,966	142,216	277,513	221,531

3. During the month of March there has been a remarkable increase in the numbers on gratuitous relief, while the numbers on relief-works have remained comparatively stationary. The figures for the week ending Saturday, the 17th April, which appeared in the *Calcutta Gazette* of the 21st April 1897, show that in some districts the numbers on gratuitous relief are still rapidly increasing. Thus—

	1 Relief-workers.	2 Dependents.	3 Otherwise relieved.	Percentage of (3) to (1).
Shahabad (Bhabua Subdivision)	10,469	1,925	20,330	194·19
Saran	16,103	*Nil*	39,900	247·77
Champaran	85,741	6,972	52,510	61·24
Muzaffarpur	48,195	3,617	47,808	99·19
Darbhanga	143,782	14,177	57,420	39·93
Palamau	1,919	*Nil*	1,768	92·13
Manbhum	3,927	*Nil*	4,874	124·11
Nadia	19,185	6,384	23,341	121·66
Khulna	3,255	*Nil*	5,221	160·39
Bhagulpur	13,986	708	2,932	20·96
Sonthal Parganas	2,249	152	150	6·66
Puri	3,687	33	152	4·12

The ratio of persons gratuitously relieved to relief workers is highest in Saran, but it is also very high in Shahabad, Muzaffarpur, Manbhum, Nadia, and Khulna. The Government of India in this and other details of famine relief administration are anxious to interfere as little as possible with Local Governments, but they think it necessary to say that they regard these figures with apprehension, and they would be glad to be assured that in the districts just mentioned State relief is being given in strict accordance with the prescribed tests and conditions of the Famine Code, that all persons able to work and in want are required to work as a condition of relief, and that gratuitous relief in villages is restricted to the classes specified in Article 42 of the Bengal Code. In saying this the Government of India do not overlook the permission given to the Circle Inspector under the special supervision of the District Officer by Article 141 to admit persons of respectable position and family to the gratuitous relief-list if no suitable work can be found for them. But they think that it should be found possible to provide for such cases from the bounty of the Indian Charitable Relief Fund, and to restrict save in exceptional cases State gratuitous relief to the special classes of persons mentioned in Article 42.

4. It is observed that in paragraph 31 of his letter, No. 912 of the 7th April, the Commissioner of the Patna Division, commenting on the large increase in the numbers gratuitously relieved in the Saran district "hesitates to say" that gratuitous relief "is being overdone" there, "in the face of the strong opinion expressed by the Collector," and "the admitted fact that in Saran gratuitous relief must take a very high place," though he adds that the matter deserved and would receive careful attention. But on referring to the opinion of the Collector, as expressed in his letter No. 1025 dated the 3rd April, the Government of India find that that Officer reported that although deserving cases had been omitted from the lists, undeserving ones had been admitted. He also expressed his intention of drafting a great many recipients of gratuitous relief on to relief-works. The fact that the numbers on gratuitous relief in this district have, according to the latest returns, risen considerably above the figures for the 27th March would seem to indicate that the Collector's intention has not been carried out, and that many persons who are able to work are still being gratuitously relieved. The difficulty stated by the Collector to be experienced by his circle officers in distinguishing deserving from undeserving persons, pertinently illustrates the expediency of substituting in the case of all persons capable of doing work and in want, a self-acting labour test for the personal discretion of a relieving-officer. In the words of the Famine Commission, "for those who are able to work the safest and most efficacious form of State help is to provide them with work." The Government of India do not anticipate that in point of principle there is any conflict of opinion between themselves and the Government of Bengal. But what they wish to know is whether the importance of this principle in the administration of famine relief is sufficiently recognised by the district Magistrate of Saran and of the other districts in which the numbers in receipt of gratuitous relief bear an excessive proportion to the numbers employed on relief works.

5. The second point which has struck the Government of India in examining the March returns is the great number of relief-works open in some districts. In Muzaffarpur, for instance, there are 70 works open on which 48,000 labourers are employed, giving an average of only 700 labourers to each work. The scattered character of the relief-works must, it seems to the Government of India, add greatly to the difficulty of efficient supervision and the enforcement of the labour tasks. It is highly creditable to the famine-relief officers that the outturn of work reported to be secured from the workers in the several districts is so good. But the difficulty of securing correct measurements of work and strict enforcement of tasks is recognised to be very great even under the most favourable conditions, and there is evidence in the district reports accompanying the Commissioner of Patna's fortnightly reviews that inaccurate and fraudulent measurements not unseldom occur on the works at present open in Behar. The Government of India are doing what they can to assist the Government of Bengal in obtaining the services of military non-commissioned officers as charge superintendents of works. But it is doubtful whether the full number of officers asked for can be obtained, and the Government of India would suggest for

the consideration of His Honour the Lieutenant-Governor whether with the view of concentrating and thereby utilising more effectively the available staff of work-agents and charge superintendents, greater resort might not be had in the Behar districts to large works professionally managed by the Public Works Department. The Government of India are aware that owing to difficulties about establishments the transfer of works from the civil authorities to the Public Works Department has made as yet but slow progress : and there may be special reasons, such as the absence of large drainage, road, or embankment projects, which prevent the concentration of relief labour in Behar on important works. But there can be no question that the general experience elsewhere in this and in former famines is all in favour of large works professionally controlled, whenever the number of persons seeking relief is numerous. I am to invite an expression of the Lieutenant-Governor's views on the above suggestion.

6. With reference to the complaint of the East Indian Railway authorities that they cannot obtain labour for the construction of the Moghul Sarai-Gaya line on account of the labouring classes preferring the relief works, and to the action taken by the Commissioner and the Collector thereupon, I am to say that similar complaints have been preferred elsewhere in other provinces, and that the Government of India consider that every such complaint should be made the subject of searching investigation. If inquiry shows that a relief work is attracting numbers of persons who in other years would resort to the railway work and who could, with food at its present price, earn enough at contract rates to support themselves, steps should obviously be taken to prevent such undesirable competition. If the inquiry, on the other hand, shows that the complaint is not well founded, it is desirable for the good credit of the famine policy of the Government that it should be clearly and openly refuted. In connection with the subject of the alleged attractiveness of relief-works I am to ask what decision has been arrived at regarding the introduction of petty piece-work in certain cases and in certain localities, which was stated in paragraph 2 of your letter No. 778, of the 18th March to be under consideration.

7. In paragraph 4 of your letter No. 778 of the 18th March, it is said that it would be helpful to the Government of Bengal if the Government of India could furnish it with information regarding the tasks demanded and actually found capable of being enforced as tests of distress in other provinces. I am to say that information has been called for from Local Governments and that it will be furnished on receipt to the Government of Bengal.

I have, etc.

T. W. HOLDERNESS,

Deputy Secretary to the Government of India.

No. 1158 F.G., dated Bankipore, the 11th May 1897.

From J. A. Bourdillon, Esq., Offg. Commissioner of the Patna Division, to the Secretary to the Government of Bengal, Revenue Department.

I have the honour to submit herewith my famine report under sections 13 and 24 of the Famine Code for the second-half of April. The figures in the statements refer to the three weeks ending 17th and 24th April and the 1st May. I regret that the report is so late, but the figures to be collected were those for three weeks instead of a fortnight, involving much extra labour both in the local offices and in mine. The report for the Darbhanga district, in which both the numbers relieved and the number of works open are larger than anywhere else, was not received in my office till midday on the 12th owing to the misbehaviour of the messenger.

PART I.—Introduction.

2. Since the date of my last report I have made two short tours in the Division.

3. On the evening of the 21st April I met at Bankipore the Hon'ble Mr. James, Vice-President of the Executive Committee of the Indian Famine Charitable Relief Fund, and accompanied him to Motihari. After spending the 22nd at Motihari, we travelled by night to Muzaffarpur, and after passing the forenoon of the 23rd there proceeded to Darbhanga, arriving in the evening. On the afternoon of the 24th Mr. James went on to Calcutta, and I returned to Bankipore. During this tour we discussed at great length with the three Collectors the condition of their districts and the proposals for the expenditure of the funds allotted by the Provincial Committee. We also interviewed at each place the members of the District and Sadar Local Committee, and discussed their plans with them. Mr. James was also shown the poor-houses, as well as our systems of task work and of gratuitous relief.

4. My next tour was in the Saran district. On the 29th April I went up to Chapra by the morning train, and spent that day and the next at Chapra, as it was essential that I should discuss with Messrs. Earle and Chapman together not only famine affairs, but also important matters connected with the Hutwa Estate and others. I inspected the Chapra poor-house, which is the best that I have yet seen for completeness and good management. Mr. Chapman, who has had charge of this work, deserves credit for it. On the evening of the 30th I proceeded to Siwan with Mr. Knyvett, District Superintendent of Police, where I spent the night and saw Messrs. Tytler and Lyall. On the morning of the 1st May I drove to Hutway, where there were many matters to be discussed with the manager and his assistants; here I was met by Messrs. Gauntlett and Garrett. In the evening, after an interview with the Maharani, I drove to Gopalganj with Mr. Chapman, Officiating Collector, who had joined me at Hutwa in the afternoon. On the 2nd May I drove with Messrs. Chapman and Lister (Subdivisional Officer of Gopalganj) to Jhajwa (18 miles), where we met Mr. Lang (Charge Superintendent), Mr. Pridham (R.E.), Assistant Engineer, and Messrs. Vipan and Berrill, local planters. As it was Sunday, there were no workers visible; but we examined two large works on the way. In the afternoon we drove on to Bansghat Factory (7 miles), were we found Messrs. Toogood and Maconchy. On the 3rd May Mr. Chapman and I drove to Rajaputty Factory (7 miles), where I had some conversation with Mr. Mackenzie, the Manager, and then rode about 7 miles (there and back) to the Jagdispur tank, where we were met by Messrs. Toogood and Maconchy again. The people on this tank, which is under Public Works Department agency, were on strike, because the task had been raised under my orders. They were in excellent condition, and fully capable of doing the task. We next drove to Bahrowlie Factory, where we were entertained by Mr. Filgate, the Manager, who has been of great assistance to the Collector in many ways. From Bahrowlie we drove through Mashrak to Chapra, 26 miles—arriving at dark. On the 4th May I returned to Bankipore.

5. My observations on this tour fully supported Mr. Earle's differentiation of the distressed portions of his district. East Gopalganj and the north-eastern corner of the Sadar subdivision are certainly the worst parts of the district that I have yet seen, and undoubtedly require help, but I doubt whether the distress is so acute as Mr. Earle thinks, and the attitude of the people towards relief works shows that they still have some resources: here, as elsewhere, there is a small percentage who are in very acute distress from high prices and the failure of crops. The prospects of the crops in the country all along the road from Maskrak to Chapra were very good, but this is admittedly one of the best parts of the district.

PART II.—District Reports.

6. *Patna.*—The brief statement that "all's well" is almost sufficient for a report of this district during the past three weeks. Crop prospects are excellent.

Prices are fairly steady with a slight tendency to rise, especially in the case of common rice. Cultivators are said to be holding on to their *rabi* everywhere.

7. Food-grain traffic is as brisk as ever. The imports during the three weeks under review aggregated 1,16,890 maunds, while the exports were 70,114 maunds, leaving a balance of 46,776 maunds in favour of the district. At the end of the previous fortnight the balance in favour of imports was only 17,231 maunds. Out of these imports, 85,141 maunds were rice, and 12,440 maunds wheat, the latter mostly from the westward.

8. The Collector has been trying to carry out his ordinary repairs to District Board roads this year by a system of direct payments, but finds that the labourers are well enough off to be able to refuse $2\frac{1}{3}$ and even 3 annas a day. Nothing could be more eloquent of the good condition of the people in this district.

9. The Bankipore poor-house contained on an average 111 persons a day during the last three weeks.

10. *Gaya.*—There is no change in the prosperous condition of this district. The *china* crop, which ripens here earlier than in the districts north of the Ganges, is nearly harvested, and this will add to the already ample food stocks in hand. The *mahua*, which is an important crop in this district, especially in the south, has been better than it was last year.

11. Prices show a tendency to harden, but the difference is very slight. Burma rice is selling everywhere a little cheaper than country rice.

12. Imports for the three weeks were 22,691 maunds against 11,244 maunds, and exports 977 maunds as against 1,177 maunds, so that for this longer period the balance in favour of the district was 21,911 maunds as against 10,067 maunds in the preceding fortnight. It is probable that much of the imports which were chiefly rice (17,630 maunds) were intended for re-exportation to Palamau, as 2,232 maunds of that grain went southward.

13. A considerable number of persons were fed at the kitchens along the Grand Trunk Road, the average daily numbers being as follows: Barachatti 36, Kusa 98, Madanpur 86, Aurangabad 133. A relief kitchen at Nawada had an average daily attendance of 38, and that at Badhaul, kept by a local Mahant, gave cooked food to 66 and grain doles to 82 persons a day on the average.

14. *Shahabad.*—From this district also the report shows that matters are progressing satisfactorily, although the collector has had to extend his affected area by including the Rohtas plateau and the Akbarpur tract along the Sone. The total area affected has been carefully recalculated, and including the two tracts just named, it amounts to 1,632 square miles with a population of 381,296 persons.

15. The public health in the district is good, although in the Bhabhua subdivision the death-rate for March was somewhat higher than usual; but Mr. Windsor in his 12th and 13th paragraphs has shown that this was almost entirely due to small-pox, which also caused many deaths in February.

16. Prices remain practically stationary; and this fact, coupled with the large exports to be noticed below, seems to show that stocks are plentiful in the district as a whole. At Bhabhua while rice and peas remain the same, wheat is half-a-seer cheaper and *rahar* a seer dearer than it was three weeks ago.

17. There has been a further development of exports in the period under report. Imports by rail were 26,368 maunds against 28,777 maunds, and exports 56,998 maunds against 28,407 maunds, so that the result was a net loss to the district of 30,630 maunds instead of a small gain of 370 maunds. The imports consisted mostly of rice, and the exports were *rabi* cereals and pulses. The arrangements for getting information from Zamania and the river side ghats are now completed.

18. The following statement, as usual, gives the figures for relief works and gratuitous relief:—

SHAHABAD.

Week ending.	Number of works open.	Average daily number of male units on—				Average daily outturn per male unit.	Cost per 1,000 cubic feet.
		Task work.	Daily wage, irrespective of task.	Gratuitous relief, including dependants.	Total.

The number of works open remained the same, for though two have been closed, the Hata-Bhabhua road because it was finished, and the Hata-Durgaoti road because it was near the Railway works, two others have been opened, viz., the Bhabhua-Rajghat and Bhabhua-Jahanabad roads. A tank is also being excavated at the expense of the Sabar Ward.

19. The daily average number on task work shows a steady diminution, due partly to the reduction of the wage caused by an alteration of the grain basis from rice at 8½ seers to a mixture of peas and rice at 9½ seers. It is also partly due to the closing of the two roads mentioned above, which has not yet been followed by a corresponding increase in the numbers on the two new roads, and the railway there is also some private work which attracts labour. The increased railway rate of Rs. 2-8 per 1,000 cubic feet is beginning to attract rather larger numbers, the daily average of persons on the railway in the three weeks under review having been 6,702, 9,236 and 10,231.

20. The numbers on daily wage irrespective of task show some increase as compared with the figures for previous periods, and are now 14·61 per cent. of those on task work, whereas in the previous fortnight they were only 8·63. The reason is that under recent orders those who receive the Sunday wage are entered in this category, and not among the task workers.

21. The outturn of work and cost rate remain good, considering the hardness of the soil. The Collector has just made a tour in Bhabhua, visiting all the relief works, and he was on the whole satisfied with what he saw. The individual digger system is in force in this district, and as it is working well and can be maintained, because the numbers are small, I have decided not to interfere with it, or to insist on the pit-gang system being introduced. The results are good enough to justify non-interference.

22. Gratuitous relief is still very large in this district. Since the date of my last report I have been in correspondence with the Collector on the subject, and he urges strongly that the peculiar circumstances of the district, which have more than once been detailed before, justify the high figures. However a remark in the report now under review shows that the classification of labour in this district is not the same as that adopted elsewhere. Mr. Windsor says that all his labourers are B class, and that none of them are so weakly as to require to be set a special task. As it is certain that many such weakly persons must be in existence, and as the numbers on daily wage are too small to allow of their all being included in that category, the inference is irresistible that many of those who are now in the receipt of gratuitous relief ought to be working as D class labourers. On the

other hand, the Collector reports that he has carefully checked the gratuitous relief lists, and finds that they are satisfactory. The point will be fully discussed with Mr. Windsor.

23. The poor-houses, along the Grand Trunk Road and elsewhere, continued to relieve a number of persons, the daily average for each of the three weeks having been 581, 610 and 701.

24. *Saran.*—The feature of the last three weeks in this district is a steady rise in the numbers on relief works and in those receiving gratuitous relief; in other respects there is not much to notice.

25. Rain fell here, as elsewhere, on the 21st and 28th. Much benefit to the pasture has occurred from these flying storms, as well as to the *china* and sugarcane.

26. Crop prospects are excellent. As already stated, I have during the past week made a short tour in Saran, and I was gratified, though not surprised, to find with what readiness and resource the raiyats have almost everywhere adapted themselves to the season. *Chours* and swamps usually abandoned to the village pig, the buffalo, and the cattle egret, are this year green with early rice and *janera;* almost every piece of land which it is possible to irrigate has a crop of *china*, which may be seen in every stage of growth, and vast stretches of land lie waiting for the *chadoi* or the rice crop, all ready ploughed or dug up with the hoe. Mr. Tytler, Sub-Deputy Opium Agent of Siwan, estimates that 50,000 bighas in the north and west of the district have this year been sown with *china*, and it would probably not be too much to say that the district contains 100,000 acres of this useful grain, which, if well watered, yields 15 or 20 maunds an acre.

27. Having regard to these prospects and to the effect which the *rabi* crop has had on the condition of different parts of the district, the Collector has revised his areas of distress, and has reduced the area to 1,512 square miles with a population of 1,416,176 persons. He has submitted his monthly map coloured accordingly.

28. Prices show very little variation, and are if anything easier at Gopalganj than elsewhere.

29. Taking the statistics for rail, road and river together so far as they can be ascertained, the imports during the three weeks amounted to 162,652 maunds against 94,256 maunds in the previous fortnight, and the exports were 18,115 maunds against 9,761. The result is the large balance in favour of the district of 144,547 maunds, against 84,495 in the previous fortnight. Most of these imports were rice from Calcutta and the Burdwan Division, but there is a considerable importation of "other food-grains" from the neighbouring districts of the North-Western Provinces. The total rice imported aggregated 89,820 maunds, and wheat reached 20,163 maunds.

30. The accompanying statement gives the usual particulars as regards relief works and gratuitous relief:—

SARAN.

Six new works have been opened, and out of the total, 33 are under civil and six under Public Works Department agency.

31. Turning first to relief works, it will be seen that there has been a steady advance during each of the last three weeks in the numbers on works equivalent to 76·54 per cent. in all during that period, the increase being 70 per cent. in the case of task workers and 107·9 in that of those paid by daily wage irrespective of task. As the figures in Form 5 are still submitted in the old form, it is difficult to say where this increase has occurred, nor has the Collector said anything on this point.

32. The daily outturn of work is fair and the cost rate low. This is partly because the Collector takes, as his basis for the grain equivalent, barley at from 12 to 14 seers the rupee. The Public Works Department figures of outturn are better than those for Civil Agency works (see Form 7) : first, because many of the Civil Agency works are tanks ; and, secondly, because the chief Public Works Department work in the district is in extraordinarily light and easy land.

33. The pit system is now being introduced. Mr. Earle, the late Collector, hesitated to introduce it, partly because he had no forms and partly because he found that with his small numbers he could manage to measure up and pay for the work of each digger and his carriers, which is after all the ideally fair system. I found that there was much leniency in regard to classification of soils, but I am now glad to learn that my orders for the exaction of a task of 200 cubic feet are being introduced : it can be done with ease almost everywhere.

34. The numbers on gratuitous relief are again very large, and Mr. Chapman, who has just taken charge, is disposed to think that it has been somewhat overdone in some parts of the district. I have little doubt of the fact, and hope that by close scrutiny he will be able to keep the numbers down. It is significant that there are very few D class labourers, and (a fact which was brought to my notice when I was in the district) the number of chidren who are relieved as dependants is extremely large, especially on works under Public Works Department agency, where there were 21 children dependants gratuitously relieved to every 100 task workers of all sorts. I have instructed the local officers that they must scrutinise more carefully the claims of children to be classed as dependants, and I also ordered that, if the numbers still continued large, kitchens were to be opened for the children at all large works, and that they should be fed on the spot instead of receiving pice to take to their parents. I trust that these two changes in practice will have the desired effect. During the last week of the period the average daily number of adult units in receipt of gratuitous relief amounted to 70·14 per cent. of all the adult units relieved in every way.

35. The relief works under the Hutwa Raj again give results much below those on works under Government officials : the outturn per male unit was not much more than half that obtained on Government works, and the cost rate

therefore is nearly twice as high. The Collector has called on the Manager to explain, and I trust that he will be able to improve the administration; it is true that many of the Raj works are tanks, but even if this point be conceded, there is no doubt that there is still room for more strictness and closer supervision.

36. The numbers in the poor-houses have begun to rise again, as the *rabi* harvest is over; in the four Hutwa institutions, the daily average was 409 against 231 in the previous period, and in the Government poor-houses it was 106 against 85.

37. The appended statement giving payment of money-orders month by month shows that the total receipts in April 1897 were only about half what they were in April 1896; the meaning obviously is that the emigrants are returning earlier than usual, for in 1896 the large drop occurred in May 1896; as times are hard and prices high all over the Province, it may well be that such large savings are not being brought back as usual; but, as I have already reported in a separate letter, more than 16 lakhs of rupees have been remitted to this district by small money orders between the 1st October 1896 and the 31st March 1897.

38. *Champaran.*—In this district the two principal features of the last three weeks' administration have been a steady decrease in the numbers on task work, and a somewhat disquieting rise in the prices of food-grain.

39. Public health continues good, and for April was relatively better than in March, the death-rate of the district being only 2·15 per mille, against an average for the past five years of 2·34. In Motihari, Madhubani, and Adapur thanas the rate is slightly above the average; elsewhere it is below it, as details are not yet available. They will be discussed in Mr. Macpherson's next report.

40. Rain fell on the 20th April in scattered showers, very variable in quantity, Motihari receiving an inch and a third, and Bagaha little more than a quarter of an inch. The effect was everywhere beneficial except to the indigo in a few places.

41. To show the range of prices, the Collector has given as usual the prices of the common grains at Motihari and Bettiah for the last day of the past four weeks, and has supplemented the information by the remarks in paragraph 12 of his report. At Motihari common rice and barley are a quarter of a seer dearer than they were four weeks ago, and *rahar* is 7 chitaks dearer; on the other hand, wheat is $1\frac{1}{4}$ seers cheaper, and gram 7 chitaks cheaper than before; maize is stationary. At Bettiah all grain is cheaper than at Motihari, but a glance at the average for five years shows that this is practically a constant incident; at this mart common rice and maize are unaltered in price, but there is a rise of a seer in barley, and a quarter of a seer in wheat. On the other hand, grain is a seer cheaper, and *rahar* is cheaper by a seer and a half. In the bazars of Hardih thana common rice is sold between $7\frac{1}{2}$ and $7\frac{3}{4}$ seers, and in Bagaha it has risen from 9 to $8\frac{3}{4}$ seers; it is impossible that, at these rates, rice can be the common food of the people, and it is more likely that they are living on barley and gram. The Collector's latest weekly telegram states that the famine wage is based on maize at $9\frac{3}{4}$ seers.

42. Mr. Macpherson further states (paragraph 7) that the question of seed grain is now of pressing importance, and he will be asked at once to submit a special report on the subject. He has funds at his disposal for advances under the Agriculturists' Loans Act, and these can be freely used at once.

43. For the first time for many weeks there appears to be some check in the amount of grain imported by rail. The figures for the three weeks are 42,216 maunds imported and 671 maunds exported, against 71,854 imports and 246 maunds exports for the previous fortnight. The net result of the period is a balance in favour of the district of 41,545 maunds against 71,608 maunds for the fortnight previous. The imports to Bettiah also fell off considerably for some reason not explained, probably the *rabi* crop. Most of the imports were rice and paddy as usual, viz., rice 28,014 maunds and paddy 12,719 maunds, of which almost all came from Howrah, viz., 26,657 maunds and 12,169 maunds respectively.

44. The following table gives as usual comparative statistics of relief works and gratuitous relief:—

Week ending.	Number of works open.	Average daily number of male units on—				Average daily outturn per male unit.	Cost per 1,000 cubic feet.
		Task work.	Daily wage, irrespective of task.	Gratuitous relief, including dependants.	Total.

The number of works has been increased again by the opening of three new Civil Agency works, and eight under Public Works Department Agency. The former now number 54 and the latter 27; of the eight new works under the Public Works Department, five are sections of the two big canals at Tribeni and Dhaka.

45. There has been a steady reduction in the number of task-workers (as a reference to my previous reports will show) since the week ending the 13th March, when the daily average was 92,654. Mr. Macpherson explains that it is partly spurious, since during the last three weeks those who receive the Sunday wage have for the first time been placed under those who receive the daily wage irrespective of task: it is also partly due to "the changes consequent on the closing of a number of works in North Bettiah, in order to transfer as much labour as possible on to the Tribeni canal." These explanations affect the last few weeks, while for the earlier weeks of the period, it was said that the *rabi* harvest attracted a good deal of labour. All these causes, however, seem to me hardly to account for the quantity and persistence of the decrease, and the Collector will be specially addressed on the subject.

46. The outturn of work is improving, and is better on Public Works Department works than on those under Civil Agency, as the latter include an immense proportion of tanks. In a circular now under issue, I am directing all officers in whose district the piece-work system has been sanctioned to show the results separately from those for task-work, and in a separate letter to Government, I have asked permission to amend Form 7 for this purpose.

47. The decrease in cost rate is partly due to the elimination from the calculation of the payments made on Sunday, but this should not have been done: it is fair enough in calculating the outturn to divide only by the numbers of those who actually helped to produce it, but in calculating the cost of work, the whole of the attendants, special gangs and others should be included, since without them the work could not go on. The numbers on daily wage, irrespective of task, have risen for the reasons given in paragraph 45 above.

48. Mr. Macpherson's verdict is strongly in favour of the pit-gang system for reasons stated in his 22nd paragraph. In this district the piece-work system has been sanctioned in five large works, and was introduced on the Tribeni canal effectively only during the last week of the period under report. The rate of Rs. 1-14 per 1,000 cubic feet, first offered, was found by actual experience to give less than could be earned on task works, and had not Government sanctioned as a special case a rate of Rs. 2-8, the experiment would have broken down: it will be most carefully watched.

49. The numbers on gratuitous relief are still going up slowly, and the Collector points out that during the three weeks just past the daily average

numbers (not adult units) relieved, has gone from 60,870 to 64,484, which last figure is the equivalent of 4·3 per cent. of the population of the distressed area. This proportion is rather above the 3 per cent. which has been taken as a fair standard, but the Collector is alive to the fact that incessant checking is necessary, and with the additional officers now at his disposal, or shortly to be so, this closer supervision will be possible. Some of the recipients also will go off our lists on to those of the Charitable Relief Committees. A reference to Form 6 will show that in this district the number of dependants relieved on the relief works is well kept down. The percentage in the last week under report is 7·9 to all the persons gratuitously relieved.

50. In the six Government poor-houses in the district, a daily average of 535 persons was fed throughout the period under report. The high rate of the dole, 1 anna 8 pies, is explained to be due to the miserable condition of the inmates of these institutions, who are mostly sick beggars and waifs, who have been discovered and brought in, and require to be fed up with special diet and comforts.

51. The number of kitchens open was 11 with a daily average of 607 persons: it is clear that these institutions are not needed for the special purpose which makes them so valuable in Muzaffarpur.

52. Three of the Collectors' Charge Superintendents have been ill during the period under report.

53. *Muzaffarpur.*—As has been anticipated for some time, the three weeks under review have been marked by a steady increase in the number of those on relief works and in the receipt of gratuitous relief, but the increase, though considerable, has not been so great as was expected.

54. The health of the district remains remarkably good, and the rain which fell about the 20th and 28th of April, greatly benefited the growing crops, *china*, *moong*, and sugarcane, and secured the pasturage, at any rate for the present.

55. Prices are fairly stationary. That of rice has risen everywhere, but as regards other grains the Muzaffarpur market is steady. At the two sub-divisional head-quarters some grains rose in price and others fell; wheat falling at both, and gram, which has not been a very good crop this year, rising at either place. There is no apprehension as to the sufficiency of food stocks.

56. Imports have apparently developed largely, but taking into consideration the longer period under report, the result is about the same as in the previous fortnight. Imports were 94,887 maunds against 62,386, and exports 4,656 against 1,647—the balance in favour of the district as the outcome of three weeks' traffic was 90,231 maunds against a net importation of 60,739 maunds in the previous fortnight. Of this quantity the greater portion (52,280 maunds) was rice, while 28,597 maunds of "other food-grains" were imported. Next to Muzaffarpur which imported 48,201 maunds, comes Sitamarhi with 12,427 maunds, two-thirds of which were rice.

57. The usual comparative statement of relief of all kinds is given below :—

Week ending.	Number of works open.	Average daily number of male units on—				Average daily outturn per male unit.	Cost per 1,000 cubic feet.
		Task work.	Daily wage, irrespective of task.	Gratuitous relief, including dependants.	Total.

There has been a considerable increase in the number of works open, and in this respect Muzaffarpur now stands second to Darbhanga only: of the 94 works open, 74 were under Civil Agency and 20 under that of the Public Works Department.

58. It will be seen that for the last five weeks there has been a steady rise in the numbers on relief works and in the receipt of gratuitous relief. The Collector has not stated whether this rise was general, but I have had the figures totalled, and I find that for the last three weeks the grand *total* of male units on relief works in each subdivision has been as in the margin. The figures denote a steady increase of pressure from high prices all over the district. That the rush has not been greater is probably due to the causes detailed in Mr. Hare's 4th paragraph: he has certainly succeeded in exacting a very high average outturn, and it is also true that the people are as a rule in good condition: for these results he undoubtedly deserves every credit, especially as they have been obtained at the expense of more anxiety than most officers would care to undergo. It is too early yet to say more on the subject. Except in the middle week of the period the outturn under Civil Agency was superior to that obtained on works under Public Works Department Agency.

Date.	Subdivision.		
	Sadar.	Hajipur.	Sitamarhi.
1	2	3	4
1897.			
17th April ...	55,669	42,167	128,441
24th „ ...	62,723	57,490	147,050
1st May ...	76,726	61,150	158,869

59. On the Darbhanga Raj relief works in the Parihar Circle, a daily average number of 2,128 persons was employed.

60. Under gratuitous relief there has also been an advance to almost exactly the same extent—for whereas in the three weeks under review there has been an advance of 41·54 per cent. in the average daily number of male units on relief works, the increase in the average number of adult units daily receiving gratuitous relief has been from 39,339 to 55,888, or 42·04 per cent. I do not suppose that these figures will rise much higher, for the proper objects of charitable relief should by this time all have been entered on the Circle Officers' lists, while the number of new candidates should be more than counterbalanced by those who are transferred to the Agents of the Charitable Relief Fund. The ratio of those in receipt of gratuitous relief to those in receipt of all relief was 53·04 during the last week of the period.

61. The six Government poor-houses in each of the three weeks contained a daily average of 232,218 and 223 inmates. In the Darbhanga Raj poor-house at Parihar an average of 254 persons was fed daily.

62. The kitchens for children which form an important feature of relief in this district have again done excellent work: they were 26 in number, and in the three weeks under review there were fed on an average every day 2,587, 4,044 and 4,865 persons; of these 73·64 per cent. were children, and they averaged respectively 1,929, 3,027, and 3,510 per diem in each week. The fact stated by Mr. Hare, that particularly in the Sitamarhi subdivision the people have begun deliberately to starve their children, especially the girls, rather than suffer themselves, is eloquent of the height which the pinch of hunger has reached. The same fact has been reported from Darbhanga and the worst parts of Champaran also. The attention of other District Officers will be drawn to the matter.

63. *Darbhanga.*—In this district steady progress is being made, and I am glad to be able to report that numbers are not rising. The expected rush has not yet begun.

64. Prices still remain stationary. Common rice is dearer at all the subdivisional head-quarters, and *marua* and *rahar* are dearer at Darbhanga, while gram is cheaper. At Samastipur *rahar* is cheaper: at Madhubani there is a fall in the price of wheat, barley, *marua* and *rahar*: all grains not mentioned above

have undergone no change in price. Food stocks in the bazars seem to be sufficient everywhere, except perhaps in parts of Bahera thana, were, according to the Collector, the grain is in the hands not of bunniahs, so much as zamindars, who are holding back for higher prices. The Local Committee of the Charitable Fund applied for leave to spend Rs. 5,000 in importing and selling grain to break this ring, but I have refused to sanction the proposal. If the difficulty continues, and the holders will not listen to reason, the Collector may have to appoint contractors under section 36 of the Famine Code, and to plant bunniahs on his relief works with the privileges allowed in paragraph 20 of Government Resolution No. 420M.P.I.

65. Imports of food-grain by rail show a satisfactory increase. The total imports for the three weeks aggregated 1,86,346 maunds, and the exports were 4,974 maunds, giving a net excess of imports of 1,81,372 maunds, or an average net import of 60,457 maunds a week: in the previous fortnight the average weekly net import was 40,967 ; the imports having been 85,063 maunds against 3,128, and the balance in favour of the district 81,935 maunds. Out of the total imports, *i.e.*, 1,86,346 maunds, as much as 63,249 was rice, and 79,581 other food-grains.

66. The statistics for relief works and gratuitous relief are compared as usual in the following statement :—

Week ending.	Number of works open.	Average daily number of male units on—				Average daily outturn per male unit.	Cost per 1,000 cubic feet.
		Task work.	Daily wage, irrespective of task.	Gratuitous relief, including dependants.	Total.

There has been an advance in the number of works, which now number 152, divided as follows :—Civil Agency, 108 ; Public Works Department Agency, 44,

67. As regards male units on relief works, the total daily average numbers for the last five weeks are as follow, including both tasks workers and those on daily wage irrespective of task: 75,200, 84,234, 75,174, 107,119 and 103,172. The oscillations in the total are remarkable and are apparently due to the *rabi* harvest. The increase in the number of persons on daily wage, which is noticeable in the last three weeks, is due partly to larger numbers being employed in dressing gangs, partly to the effect of my orders that all those receiving the Sunday wage should be shown as receiving daily wage irrespective of task. The outturn is rising, and the cost rate falling. Form 7 shows that the outturn of work is still better on Civil Agency works than on those under the Public Works Department.

68. The figures below show that fluctuations have occurred in each subdivision. It will be seen that in the last week of the period under report, the falling off is accounted for in the Madhubani subdivision, and on Civil Agency works in the Sadar subdivision Public Works Department works have gained what the Civil Agency works have lost clearly implying a taking over of works.

In the previous week all the advance was in the Sadar subdivision, Madhubani remaining stationary :—

Subdivision.		April 3rd.	April 10th.	April 17th.	April 24th.	May 1st.

69. Paragraphs 17 to 27 of Mr. Carlyle's report contain a valuable and interesting criticism on the pit-gang system which may be read ; as soon as the reports on this subject are received from all districts, they will be collated and a separate report submitted. In the meanwhile I propose to circulate to other officers for information and guidance Mr. Carlyle's account of the modified system introduced by Mr. Blackwood. I have seen the system working and it succeeded admirably.

70. Gratuitous relief has increased slowly in the three weeks : from 65,685 adult units to 64,068 : the rise is equivalent to 13·02 per cent.. The dole is now steady at about 9·7 pie, except those distributed by Public Works Department Agency, which are all to children dependants on relief works.

71. Poor-houses were opened in eight places as before : the daily average of inmates in the last week of the period was 238, as against 194 in the last week of the previous fortnight. Mr. Carlyle notices that children are not being properly fed, and I shall be glad to see him open kitchens in several places, as has been done in Sitamarhi.

72. The Darbhanga Raj had a daily average of persons on relief works during the fortnight, and on gratuitous relief.

PART III.—Conclusion.

73. The three weeks under review have been a period of steady progress, and it has witnessed the introduction of one or two improvements in administration. There has been a rise in the numbers both on relief works and in the receipt of gratuitous relief, but it has not been so great as has sometimes been anticipated.

74. There was rain in all districts on the 20th and 31st April, and in most on the 28th. This fell in scattered showers, varying as much in intensity as in locality. The result has been purely beneficial, except in the few cases where damage has been done to indigo, for the rain has refreshed the crops on the ground—sugarcane, *china*, *moong*, early rice and *janera* has gone far to secure pasturage, and has to some extent filled the wells and tanks.

75. Crop prospects in these circumstances are excellent, and it is the subject of universal remark that lands have been prepared for *bhadoi* and early rice this year unusually early and to an unusually large extent.

76. The public health continues good everywhere except in Bhabua, where there has been a good deal of small-pox, and in Patna City, where (as is always the case at this time) cholera has broken out. Cattle disease has been very bad in Patna and in parts of Darbhanga.

77. Prices remain fairly steady with a tendency to rise slowly: in one or two outlying tracts in Bagaha and Hardih, in Champaran, they are very high, and in Bahera, in Darbhanga, the Collector reports that they are kept up by a combination, not of bunniahs, but of zamindars. I give in the appendix statement showing the prices of common rice, wheat and barley on the last Saturday of each of the last seven months: it will be seen that the rise is nowhere alarming.

78. The imports and exports of the past three weeks are set forth below :—

District.	Imports.		Exports.		Excess—I. or E.	
	Fortnight ending 10th April 1897.	Three weeks ending 1st May 1897.	Fortnight ending 10th April 1897.	Three weeks ending 1st May 1897.	Fortnight ending 10th April 1897.	Three weeks ending 1st May 1897.
1	2	3	4	5	6	7
	Mds.	Mds.	Mds.	Mds.	Mds.	Mds.
Patna	68,566	1,16,890	51,335	70,114	I. 17,231	I. 46,776

Muzaffarpur ...	62,386	94,887	1,647	4,656	I. 60,739	I. 90,231
Darbhanga ...	85,063	1,86,346	3,128	4,974	I. 81,935	I. 1,81,372
Total... ...	4,20,044	6,57,050	95,701	1,56,505	I. 3,24,343	I. 5,00,548

It will be observed that there is a large increase in the excess of imports in all districts, except Champaran and Shahabad. In Champaran imports still exceed exports, but the balance is smaller than before. Shahabad has again been exporting her *rabi* so fast that the balance is heavily on the side of exports. The increase in Darbhanga and Saran is very large. The imports of rice from Howrah are shown in the margin for the last four periods. There is a large rise on the whole in spite of the sudden fall in Champaran, the increase in Darbhanga being especially large.

District.	For the Period Ending—			
	13th March.	27th March.	10th April.	1st May.
1	2	3	4	5

Total ...	78,132	1,02,712	1,62,568	2,60,867

79. The following statement shows the number of persons receiving relief on the 1st May as reported in the *Calcutta Gazette*, and the percentage to the population of the affected area in each district on that date and on the last day of four previous half-monthly periods. There is a rise everywhere except in Champaran, where the numbers and the ratio have been falling steadily since the 13th March. The increase is apparently greatest in Saran, but that is partly due to a change in the Collector's estimate

of the total population affected. Muzaffarpur has advanced 1½ and Darbhanga about 1 per cent. :—

District.	Estimated population of affected area.	Number in receipt of relief of all kinds on 1st May.	Percentage receiving relief on the—				
			27th February.	13th March.	27th March.	10th April.	1st May.

Total ..	1,69,591	..	..	..	22,472	..	1,85,634	..	1,73,350	..	..	..	47,824	..	2,20,326·18	..

There is an increase of 3,759 in the average daily numbers of male units on task-work equivalent to an advance of 2·21 per cent. Including those on daily wage irrespective of task, the advance is 29,111, or 15·15 per cent. The large advance in those under the latter category is due to the inclusion of those paid for Sunday.

81. As is natural with both officials and people becoming daily more familiar with the work to be done, the daily average outturn is rising and the cost rate falling ; the mean outturn of the five districts represented is 39·59 against 35·8 cubic feet and the mean cost rate nearly Rs. 2–7–2 instead of Rs. 2–12–2. So, too, the range of discrepancy under this head is shrinking ; in the previous fortnight the highest outturn (Muzaffarpur was 25 cubic feet, and the lowest

Champaran 25 cubic feet) giving a range of 27 cubic feet, in the three weeks under review, the highest outturn was 56·8 cubic feet and the lowest 31 cubic feet, a range of 25·8 cubic feet. Muzaffarpur and Champaran again occupying the extremities of the scale. In respect of cost rate the difference is now only between Rs. 3–1–7 in Champaran and Rs. 1–10–2 in Muzaffarpur, as against Rs. 3–13–11 and Rs. 1–11–6 in the same two districts previously.

82. In gratuitous relief there has also been an advance of 34,692 on the daily average number of adult units relieved, which is equivalent to 18·68 per cent. There is still some variation in the average dole which, in both periods, is lowest in Saran, owing partly to the cheapness of the grain taken as the equivalent, and highest in Champaran.

83. The distribution of works, as between the Civil and the Public Works Department Agency, is given in the margin. During the past three weeks the total number of works open has increased by 51, the advance having been 41 under Civil Agency and 10 under Public Works Department Agency ; as before, the Public Works Department seem to be much hampered by the difficulty of obtaining qualified subordinates. During the period under review the important step was taken of authorising a modified system of piece-work on the principles finally laid down in Government Resolution 181 of the 6th instant. As far as my information goes, this system is actually at work only on the Tribeni canal in Champaran and the Bhagmati canal in Muzaffarpur, but I trust that within the current fortnight it will be extended to the other large works indicated in the Resolution, as well as in the Samastipur subdivision in Darbhanga, and in certain parts of Saran.

District.	Civil Agency.	Public Works Department Agency.	Total.
1	2	3	4
Shahabad ...	1	...	1
Saran	33	6	39
Champaran ...	54	27	81
Muzaffarpur ...	74	20	94
Darbhanga ...	108	44	152
Total ...	276	97	373

84. I have also drawn special attention to the necessity of checking more carefully than ever the measurements on relief works and exacting an honest task. I have also reminded District Officers that if the price of grain falls, the basis of the grain equivalent has to be altered. It is only the strict observance of these precautions that will prevent a large influx, not only of those who really require relief, but of all those also who are out of work at this the slackest season of the agricultural year.

85. Between the date of my last reports and the present date, seven officers of the Indian Staff Corps have reported themselves to me for famine duty and have been posted as follows :—Mr. Harding, 19th Madras Infantry to Saran, Mr. MacBarnett, 5th Punjaub Cavalry to Champaran ; Messrs. Bliss, 21st Madras Pioneers, Harvest, 9th Madras Infantry, and Fagan, 6th Madras Infantry to Muzaffarpur ; Mr. Hudson, 22nd Madras Infantry, and Hole, 19th Madras Infantry, to Darbhanga. Mr. Harvest has since been recalled for civil employment elsewhere. Some 60 non-commissioned officers and soldiers of the British Army have also arrived, and been posted to the four north Gangetic districts : it is perhaps too soon to judge of the usefulness of these men, but I may be allowed to note that many of them are hardly of the type that we hoped to receive ; a majority being young soldiers with little knowledge of the country and little ability to provide for themselves. I have for the present stopped the supply.

86. Details of the amounts advanced in each district during and previous to the last period are given below. Shahabad is the foremost so far, but in all districts many applications are pending, which will be disposed of as soon as possible.

District.	Amount advanced up to the 31st March 1897.	Amount Advanced since the 1st April 1897.			Remarks.
		Previous to period under report.	During period under report.	Total.	
1	2	3	4	5	6
Patna	...	...	...	...	
Gaya	...	...	...	...	
Shahabad	1,950	2,900	3,725	6,625	
Saran	9,952	746	1,432	2,178	(a) Not stated whether advanced under the modified rules or not.
Champaran	...	155	2,000	2,155	
Muzaffarpur	3,100	450	1,617	2,067	
Darbhanga	1,412	37	(a) 3,862	3,900	
Total	16,414	4,288	12,636	16,925	

87. During the period under review, a sum of eight lakhs of rupees in all was allotted for expenditure in this division by the Executive Committee of the Indian Famine Charitable Relief Fund.

This sum was distributed by me on the 19th April, as detailed in the margin. Subsequently, as the outcome of certain correspondence with the Secretary of the Fund, another sum of five lakhs of rupees was allotted to this division. A circular distributing this sum was in print and about to issue, when I received intimation that the allotment might be reconsidered, and I have therefore taken no steps to distribute this further sum of five lakhs.

	Rs.
Shahabad	25,000
Saran	1,15,000
Champaran	1,89,000
Muzaffarpur	2,15,000
Darbhanga	2,56,000
Total	8,00,000

88. The usual statement of expenditure is appended. It will be seen that so far as these figures go, the expenditure to date has been Rs. 27,71,084, of which Rs. 17,10,920 were spent up to the 31st March last, leaving an expenditure in the month of April of Rs. 10,60,164. During the last three weeks a sum of Rs. 6,58,719 has been expended. Of the total expenditure to date, Rs. 19,80,387 has been spent on relief works, and Rs. 7,38,466 on gratuitous relief.

89. The usual statements and maps are appended, but as this report is already very late, I do not delay it further to add any remarks on the progress for the month of April. I have already forwarded to Government a memorandum giving such information as I have been able to procure on the subject of food stocks, and a careful note on the agricultural operations of the next six months, prepared by Mr. Stevenson-Moore, Settlement Officer of North Bihar. The statements from Darbhanga have not been checked.

APPENDIX A.

REMARKS TO ACCOMPANY IMPERIAL FAMINE STATEMENT A FOR THE FOUR WEEKS ENDING SATURDAY EVENING, THE 27TH MARCH 1897.

HISSAR DISTRICT.

Very little rain fell during the month. What did fall came too late to do any good to the unirrigated crops which had already withered up. The rain was accompanied by hail, which did considerable damage to standing canal-irrigated crops.

Prospects of canal crops from fair to good and of sailába crops poor. Grain stocks practically exhausted, as is proved by the large amount of grain being sold which is unfit for human food. Grain continues to be imported from Sind, but not in such large quantities as before. Some grain is being now imported from adjacent districts.

Fodder is almost exhausted, but the numbers of cattle have been reduced very largely. All cattle, including even camels, are suffering from want of food.

Wages on work have risen since last month by 1 pice per head of each class owing to the rise in the price of grain.

Relief works now in progress provide sufficient employment for all applicants. The programme of proposed works is sufficient to employ people up to 15th July only, but steps are being taken to have more works ready to be started when required.

Physical condition of people not so good as it was. Drinking water is running short in many villages. Numbers in poor-houses increasing.

Numbers receiving gratuitous relief in villages have gone up. This form of relief is being well administered. Private relief has declined very much in extent, but in a few towns some of the charitable have actually extended their operations.

Death-rate has not yet become abnormal.

ROHTAK DISTRICT.

Poor-houses.—As remarked in the report of the past month, no necessity has as yet been found for the establishment of poor-houses.

Private subscriptions.—Private subscriptions, aggregating Rs. 3,602, have been raised, and Rs. 10,000 have been received from the Lahore Famine Charitable Relief Committee.

Rupees 17,637 have also been specially set aside for charitable relief purposes from the District Fund, of which Rs. 12,021 have already been expended.

Relief works.—There are 28 relief works in progress. Of these 23 have been started in Tahsíl Jhajjar, 2 in Tahsíl Rohtak, and 3 in Tahsíl Sámpla. These works though small afford labour to all seeking it.

Health of people.—There have been no deaths from starvation, and the health of the people has been good.

Stock reserves.—The stock reserves of the district are roughly estimated at 500,000 maunds, but they are getting less as the imports only slightly exceeded the exports.

Prospects of harvest.—The yield of the unirrigated crops will be *nil*, as there has been no rain to speak of. The area under canal irrigation is estimated at 127,690 acres. Both the early and late crops have suffered from a strong westerly wind and from insufficiency of water. The former is likely to be a 16-anna and the latter an 8-anna crop. Well irrigation is comparatively small, but it is mostly carried on in Tahsíl Jhajjar where there is no canal irrigation. The crop is likely to be a 12-anna one, except in the Bhur tracts and tracts affected by saline efflorescence.

Wage rate.—The average rate of wages during the month has been 1 anna to workers and 3 pies to children and dependants.

Gurgaon District.

Slight rain fell almost all over the district. Hail has done a little damage in places to standing crops, and high winds have added something to it. Rabi is being harvested and winnowed, and new grain and fodder are now being brought to the market.

Four hundred and thirteen persons are relieved at Rewári and Farrukhnagar from funds raised by private subscriptions. Committees have been formed at the head-quarters of each of the five tahsíls for collecting subscriptions.

The import of grain by rail was brisker, as the following figures will show :—

—	Export.	Import.
	Maunds.	Maunds.
6th March 1897	1,455	8,775
13th March 1897	842	5,452
20th March 1897	849	11,307
27th March 1897	1,044	5,004
	4,190	30,538

The falling-off in the number of labourers is due to harvest operations.

Seven tanks have been completed and three Municipal works have newly been converted into relief works. Two roads are being constructed and 22 tanks are being cleared as famine relief works paid from District Funds.

Delhi District.

Private relief through the Relief Committee has been extended, as the middle lower classes in the city are severely feeling the continued high prices.

The relief works are tanks and roads. The condition of the people in the affected tract is getting lowered, though no deaths from starvation have been reported nor do the people generally appear emaciated from hunger.

Food-stocks are exhausted, but are replenished by importation.

There was a great demand for labour for crop-cutting after the 20th, as fears were entertained that hail would damage the ripened crops. On this work labourers get 2 annas daily and their food, and as a result the numbers on relief works were reduced. The hot winds have ripened the crops very rapidly, and the demand for labour will be considerable till about 15th April, after which a large accession to the numbers on relief may be expected in the affected tract where crops have been very poor. One relief work was closed, but its place will be taken by the Agra Railway, on which work will commence during the next fortnight. There does not seem any prospect of improvement in the affected tract before the rains.

Karnal District.

The present state of the famine subscription fund is as follows :—

—	Rs.	A.	P.
Subscription collected locally up to the end of March 1897	7,121	10	0
Contribution received from the Punjab Committee of the Indian Famine Relief Fund	5,000	0	0
Total	12,121	10	0
Amount expended on gratuitous relief, &c., to end of March 1897 ...	2,065	4	7
Balance	10,056	5	5

Gratuitous relief has now been extended to the three principal towns of the district, namely, Karnál, Pánipat and Kaithal, and 300 persons received relief daily during the month, including the poor but respectable and parda-nashín women.

Besides the above there were 1,742 persons receiving gratuitous relief daily from Provincial Funds in villages at the end of the month.

No poor-houses have been started yet.

There are two large relief works, the Nardak and the Kaithal Rájbahas, in progress in this district, which are affording relief to 10,600 souls daily including non-working children and dependants. Rájpúts and other respectable classes have now begun to come to the works in large numbers.

Small-pox has broken out among the children of the labourers employed on the Kaithal Branch, otherwise there has been no disease of any kind during the month, and the health of the people has been fairly satisfactory.

Food-stocks still exist in the large villages of the district.

The imports of grain amounted to 1,200 maunds during the month.

The general condition and prospects of affected areas continue to be the same as before.

Wages were slightly reduced on the Nardak Rájbaha during the month.

No deaths from starvation occurred during the month.

The death-rate is far below the normal.

Umballa District.

Private relief.—Rupees 5,000 have been allotted by the Provincial Committee, Indian Famine Charitable Relief Fund. Rupees 4,000 have been appropriated for cheap shops and Rs. 1,000 for a spinning establishment. Local subscriptions are being raised. The sum raised locally in the hands of the Local Honorary Treasurer amounts to Rs. 2,373. Local subscriptions are occasionally made for digging tanks.

Village gratuitous relief is being organised.

An experimental poor-house is being started at the head-quarters of one tahsíl.

General character of relief work.—Works are for the most part tanks. One considerable work managed and financed by the Canal Department is being concluded on the Western Jumna Canal in Jagádhri Tahsíl.

The physical condition of the people is on the whole satisfactory. The menial communities are on low rations and supplement their meals very largely with wild products. They are debilitated but not emaciated. Many zamíndárs are reduced by overwork on wells and anxiety for the future.

Food-stocks are practically exhausted, the district depending on imports which the returns from railway stations show to be heavy. Figures are as follow :—

	Imports.	Exports.
	Maunds.	Maunds.
For four weeks ending 27th March 1897	49,376	8,862

The standing spring crop has been considerably damaged by dry winds ; late sown crops have generally failed. The early sown crops and well crops will give a yield, but the harvest will be a very moderate one indeed, and will not affect prices much. Forward bargains for wheat at ten seers have been made. The menial communities must, it is feared, remain distressed till the monsoon, and such zamíndárs who could not sow crops or whose crops have failed will, as their credit gives out, be reduced to coming on relief works.

The rabi harvesting operations will only cause a temporary decrease in the demand for relief labour.

There has been no change in the rate of wage during the month, the rate is as usual calculated on maize which is sold at ten seers per rupee.

Ferozepore District.

Relief was afforded in villages from money privately subscribed. No poor-houses were opened during the month. Two have since been opened, but no one will stay in them.

The relief works in progress are the same as before. These, along with the Agawah Canal, provided work for a large number of people.

The physical condition of the people is good. Stocks of food-grains have been greatly reduced, but are sufficient.

Exports during week ending 27th March amounted to 32,509 maunds and imports 7,608 maunds.

Wages were calculated on jowár at 9½ to 11 seers per rupee.

The people of the affected area take a gloomy view of things and the crops are very poor on unirrigated land. Those on irrigated land, however, are good, but caterpillars and dust-storms have done some damage.

Lahore District.

1. *Private relief.*—Besides the amounts mentioned in the previous reports a further sum of Rs. 11,000 has been allotted to this district by the Provincial Indian Famine Charitable Relief Fund. Of this Rs. 5,000 will be disbursed in the city, and Rs. 5,000 in the district. Rupees 1,000 have been allotted in order to provide the labourers with two or three days' sustenance after the relief works are broken up at the approach of harvest.

2. *General character of relief works.*—At Kácha, near the Kána Kácha Railway Station in Tahsíl Lahore, the silt clearance of a pacca tank was commenced on 2nd January 1897 as a relief work. Nearly three-fourths of this work will be completed by 10th April, the date now fixed for its closing. In the Lahore Municipality the relief works consisted of the levelling of mounds and filling up of hollows in nazúl ground. These are in progress and nearing completion.

3. *Physical condition of people.*—Physical condition of the people in affected tracts is good. There is no disease.

4. *Food-stocks.*—Food-stocks are sufficient. Import of wheat produced this year has commenced to some extent from the North-Western Provinces.

5. *General condition and prospects of the affected area.*—General condition and prospects of the affected area are not hopeful. Rain did not fall at the proper time and the crops on unirrigated land are practically *nil.*

6. *Changes in the rates of wages.*—There have been no changes in the rates of wages.

Gujrat District.

Gratuitous relief is given under Chapter V. to a daily average of 836 persons.

Poor-house relief not found necessary. The relief work is the Jhelum Canal. Physical condition of people good. Food-stocks ample. Owing to winter rains crops fair and prices easier. Rainfall during the last week of the month very favourable for rabi crops. No change in the rate of wage thought necessary. Death-rate below normal. The numbers on the works are decreasing rapidly.

Imperial Famine Statement B for the four weeks ending Saturday evening, the 27th March 1897.

District.	Maximum number for whom relief is estimated to be required in case of serious famine.	Numbers for whom relief was provided in last programme of relief works. REMARKS TO ACCOMPANY IMPERIAL FAMINE STATEMENT A FOR THE FIVE WEEKS ENDING SATURDAY EVENING, THE 1ST MAY 1897.

HISSAR.

Climatic conditions were generally favourable for harvesting operations on canal lands. At the beginning of the third week there was a violent storm of dust and rain over the whole district. The heaviest rain—one-third of an inch—fell at Sirsa. Very little harm was done to gathered crops, and on unirrigated lands some ploughing was carried on. The outturn of crops on canal lands has been on the whole satisfactory. Grain is still imported from Sind, and new barley and gram have begun to come in from Patiála and Jínd.

The supply of fodder in canal villages is now ample, but the villagers refuse to part with any to the people in unirrigated tracts. Relief works provide sufficient employment for all applicants. The programme of proposed works is sufficient to employ people up to the 15th July only. The physical condition of the people has slightly deteriorated still further, owing to lack of drinking water, bad and unusual food and to the eating of unpalatable jungle fruit. The numbers in poor-houses have much increased. There is not very much increase in those in receipt of gratuitous relief in villages.

Private relief has increased somewat in amount, and is administered now in most places in a more methodical way.

ROHTAK.

Poor-houses.—An experimental poor-house has been opened at Jhajjar.

Private subscription.—Besides the amount mentioned in the previous report a further sum of Rs. 10,000 has been received from the Provincial Indian Famine Charitable Relief Fund. Of this sum Rs. 200 have been sent to each of the four tahsíls as advances, and Rs. 259 have been subscribed by private individuals in addition to the amount of Rs. 3,602 entered in the report of the previous month. The expenditure on charitable purposes from the District Fund has been Rs. 4,428.

Relief works.—The number of relief works in progress is 20. Of these 13 are in Tahsíl Jhajjar, in Tahsíl Sámpla four, and in Tahsíl Rohtak three. No famine works have been started in Tahsíl Gohána.

Health of people.—The health of the people continues to be good, and there have been no deaths from starvation.

Food stock reserve.—The stock reserves are calculated to be sufficient for present requirements, and the slight decrease in them is being replenished by importations.

Prospects of harvest.—The yield of the unirrigated area as noticed in the previous report is practically *nil*. The area irrigated by wells is roughly estimated at 31,587 acres and that irrigated by canal water at 73,865, or a total of 105,452 acres.

The decrease in the irrigated area on canal lands is due to a short supply of canal water and on well lands to the water of a number of wells having become brackish owing to the drought and also to damage by hail.

The quality of the crops in Gohána and Sámpla Tahsíls is estimated at 14 annas and that in Rohtak and Jhajjar at 8 annas.

Wage rate.—The wage rate decreased during the latter half of the month. In the first half the calculation was made on gram, which was sold at 10 seers per rupee, and the second half on barley, which was sold at 14 seers per rupee.

The average wage rate during the month was—

Workers	10 pies.
Children and dependants	3 „

GURGAON.

No rain during the month. Rabi being winnowed. The villages in poor circumstances were inspected by Revenue Officers in order to grant revenue suspensions. New grain is being brought to the market and prices have therefore fallen.

Four hundred and fifty-nine persons are being daily relieved at Rewári, Farukhnagar and Sohna from funds raised by private subscriptions. Rupees 577-8-0 at Gurgaon, Rs. 91 in Nuh and Rs. 26 in Ferozpur have been received for the poor persons of this district.

Gratuitous relief has been started from 3rd May 1897 out of the money collected in Gurgaon.

As the funds at the credit of Rewári and Farukhnagar Local Committees have been exhausted, they have been supplemented with donations of Rs. 500 and Rs. 400 respectively from funds received from the Indian Charitable Relief Fund, Lahore.

The import and export by rail of food-grain were as follows :—

	Export.	*Import.*
	Mds.	Mds.
3rd April 1897	2,298	1,753
10th April 1897	2,260	3,101
17th April 1897	1,621	3,382
24th April 1897	2,718	7,294
1st May 1897	12,581	4,353
Total	21,478	19,883

Some of the famine works have temporarily been closed, as owing to harvest operations the number of labourers fell considerably and the wages were considered low as labourers could get Re. 0-2-0 to Re. 0-2-6 in harvest operations and on

their going to and returning from work, and at the hour of rest at midday they could collect *tentí* (Capparis aphylla) and sell them at a very good rate.

A revised programme for 1897 has been submitted. The works remaining unexhausted on the sanctioned list can employ 14,153 labourers for three months.

No deaths were reported from starvation.

Delhi.

Private relief through the Relief Committee is being granted freely, and everything is being done to reach all necessitous cases.

The relief works are tanks and roads. A section of the Agra-Delhi Chord Railway embankment was started as a famine work on the 26th, and labourers are coming in freely. The condition of the people has slightly improved from the fall in prices, but this is only temporary, as rates will run up again if the present unfavourable meteorological conditions continue.

Food stocks have been replenished by the rabi which is now coming into the market, but it will soon be necessary to depend on imports.

As was anticipated, the people are flocking again to the works now that the rabi has all been reaped.

Karnal.

The income and expenditure of the famine subscription funds during the month was as follows :—

	Rs.	A.	P.
Balance in hand on 1st April 1897...	10,056	5	5
Receipts from subscriptions locally raised	2,539	0	0
Contributions from Punjab Committee of the Indian Famine Relief Fund...	5,000	0	0
Total	17,595	5	5
Expenditure—			
On gratuitous relief in villages	800	0	0
Ditto Karnal, Pánipat and Kaithal towns ...	1,105	8	4
Total	1,905	8	4
Balance	15,689	13	1

Besides the above, 1,667 persons received gratuitous relief daily in villages from District Funds.

The necessity for starting poor-houses has not yet been felt in this district.

The two large relief works in progress in this district are considered sufficient to afford ample employment to the famine-stricken seeking relief. The health of the people continues to be fairly good. The rabi harvest is being reaped now, and the outturn on irrigated and unirrigated lands is calculated to be a 14-anna and 4-anna crop respectively.

Two thousand six hundred and sixty-four maunds of grain were imported into the district during the month.

There was a considerable decrease in the number of labourers employed on the relief works in progress in the district during the month owing to harvest times, but people have again begun to return to work.

Prices of food-grain fell slightly during the month.

No deaths from starvation occurred during April 1897.

As the percentage of non-working children and dependants was large on the Nardak Rájbaha, it was considered necessary to start kitchens on the work for these. A kitchen on the first section of the work was experimentally opened during the month, and the arrangement appears to have worked satisfactorily.

The cost per head of those fed in the kitchen was 7 pies.

Umballa.

Private relief.—Subscriptions have been raised locally in towns and villages through the agency of the Local Committee (Indian Famine Charitable Relief Fund), but these by agreement are being remitted to the Provincial Committee.

The Provincial Committee has allotted to this district Rs. 10,000 for the relief of the respectable poor. This is being utilised as follows :—

Rs. 2,000 on a cheap shop in Umballa City.
Rs. 2,000 on a cheap shop in Umballa Cantonments.
Rs. 2,000 grant-in-aid to the spinning establishment, Umballa City.
Rs. 4,000 for relief to pardha-nashín women in villages at the rate of Rs. 1,000 for each of the four southern tahsíls.

Village relief.—A system of gratuitous relief on the lines of the Famine Code at the expense of local funds has been introduced in two tahsíls and will be introduced in two more. The number of persons brought on the register is at present 705. These persons are of the class mentioned in Section 89 of the Code.

Poor-house relief.—One poor-house has been established at Tahsíl Naráingarh in the shape of an enclosure and thatched huts capable of accommodating a considerable number of inmates. There are no inmates yet, there having been no applications.

General character of relief works.—The works have been principally tanks, but there has been one considerable canal work managed by the Western Jumna Canal authorities. This closed after completion on 12th April. The raising of a section of a road has also been undertaken to afford relief to Umballa City. It must be noted, however, that at the beginning of April the tanks were deserted by relief labourers who went off to obtain employment in harvesting the rabi. There has therefore been practically no need for relief works during April, and some of them were kept closed.

The physical condition of the people is on the whole satisfactory. Relief workers show no signs of emaciation from want of food.

Food stocks.—Generally speaking the district has lost all its food stocks garnered from past harvests, but the spring crop now being garnered will give a moderate stock of wheat and barley and a little gram. Roughly speaking the outturn may be estimated at $\frac{2}{3}$ of what it was last rabi harvest (which was bad) and $\frac{1}{2}$ of an ordinary harvest. Prices have fallen about a seer, and a further temporary fall is expected as soon as the spring crop grain is actually in the market. There are heavy imports into the district. Totals of imports and exports for the month were 35,000 and 8,800 maunds respectively.

General condition and prospects of the affected area.—Land-owners will by means of food-grains obtained from the spring harvest and by mortgaging and selling manage to subsist without any appreciable proportion of them accepting relief labour even if offered, but menial communities like chamárs and others (as distinct from village serfs, who have recognised emoluments in cash or kind) will

continue to be in acute distress, and relief labour will be necessary for these at any rate until the monsoon rain falls. A centre for tank work will be kept going in each tahsíl, and it is hoped that two roads to be constructed by the Public Works Department will be sanctioned.

The recorded death-rate is below the normal, and no cases of death directly due to famine have been reported. One or two reported cases were investigated and the reports were found unreliable.

Ferozepore.

There is now only one relief work open in the district with less than 100 workers, but the numbers are rising. There are five poor-houses, one in each tahsíl, but they are very scantily attended.

The numbers on the Aghawah District Inundation Canal, which answers the purpose of a relief work, though not conducted under the Famine Code, are stationary. They are expected to increase when the harvesting is over.

Food-grains are sufficient and fodder is more plentiful than heretofore.

Rain fell during the month, proving of service to the extra rabi crops and to the grass.

Some hail fell, but the damage done was not great, and the land affected belongs chiefly to sáhúkárs. The crops on canal-irrigated land are average, but elsewhere, except on river flooded areas, they are very poor.

The condition of the people is good.

There have been no deaths from starvation. Small-pox among children and some cattle disease have been reported, but the outbreak is not serious.

Wages are now being calculated on mixed barley and gram at 11½ seers to the rupee.

	Maunds.
Total exports of grain for last four weeks	42,947
Total imports ditto	17,612

Lahore.

Private relief.—Besides the amount mentioned in the previous reports, no further amount has been allotted to this district by the Provincial Indian Famine Charitable Relief Fund or collected from other sources.

General character of relief works.—The work at Kácha was closed on 10th April 1897. Nearly three-fourths of this work has been completed. On the close of the work Rs. 320 were distributed among 736 men and women and children including gangmen at the rate of 8 annas per man and woman and 4 annas per child to furnish them with means of living for two or three days till they obtained regular employment. The number of labourers having fallen considerably, owing to the people resorting to harvesting operations in the fields, the works at Lahore also have been closed from 1st May 1897.

Physical condition of the people.—The physical condition of the people in affected tracts is good. There has been no disease.

Food stock.—Food stocks are sufficient. The harvest is being gathered. The price of wheat, the staple food of the district, has gone down.

General condition and prospects of the affected area.—There is no material alteration in the general condition and prospects of the affected area. A great deal depends upon the rains in July and August next.

GUJRAT.

Gratuitous relief under Chapter V., Punjab Famine Code, was given daily during the month to 658 people. There is no village relief, nor is there a poor-house. None were considered necessary. The relief work is the Jhelum Canal. Physical condition of the people good. There is no real distress at present. Food stocks ample.

Crops of wheat, barley and gram have been cut and prices are falling steadily. Rainfall good and favourable to early kharíf sowings.

A change in rate of wage was made owing to fall in prices.

Death-rate below normal.

Numbers on works decreased steadily all through the month.

Imperial Famine Statement B for the five weeks ending Saturday evening, the 1st May 1897.

District.	Maximum number for whom relief is estimated to be required in case of serious famine.	Numbers for whom relief was provided in last programme of relief works. BURMA.

No. 298–1–S–2, dated Rangoon, the 15th April 1897.

From C. G. Bayne, Esq., Revenue Secretary to the Chief Commissioner, Burma, to the Secretary to the Government of India, Revenue and Agricultural Department.

I am directed to submit letter No. 393–1–S–10, dated the 14th April 1897, from the Financial Commissioner, containing the famine report for Burma for March.

No. 393–1–S–10, dated Rangoon, the 14th April 1897.

From W. Thompson, Esq., Secretary to the Financial Commissioner, Burma, to the Revenue Secretary to the Chief Commissioner, Burma.

I am directed to send herewith returns in forms Appendices VI and VII, Burma Famine Code, for Upper Burma, for the period of four weeks ending 27th March 1897.

2. The estimates of affected areas and population are the same as those given last month.

3. The returns submitted from Myingyan were for the period of five weeks ending 3rd April 1897, so that the figures for that district given in the statements appended to this letter have had to be compiled from the weekly reports.

4. The numbers on relief works and on gratuitous relief again show a diminution from those of the previous month. The causes mentioned in paragraph 3 of this office letter No. 409–1–S–10, dated the 11th March 1897, have continued to operate, while the fear of cholera which has broken out in both Meiktila and Myingyan has contributed to reduce the numbers on the works.

5. The figures in column 15 are only a rough estimate, while the Myingyan figure is almost impossibly low considering that a considerable number of deaths are known to have taken place from cholera.

6. The export of rice from Lower to Upper Burma still continues, the total amount exported up to 3rd April since 1st January being 41,125 tons.

7. Further details are given below for each district separately.

Meiktila.—Gratuitous relief is being regularly distributed through the agency of local officers. The physical condition of the people remains on the whole fairly good but some deaths of children have been reported which are said to have been due to their not receiving regular nourishment. Money from the Relief Fund is being distributed to supplement the Government relief in such cases and a supply of Mellin's food has been asked for from the Relief Committee. There is considerable amount of cholera in the district and a good many deaths from it have been reported.

Food stocks are ample; rice continues to be imported in large quantities. The rate of wages was not altered during the month.

Yamethin.—The numbers on gratuitous relief increased slightly. The mortality during the month was abnormally large owing chiefly to cholera. No deaths were due directly or indirectly to famine.

Myingyan.—The Civil Officers at the Famine Camps have been appointed additional Circle Inspectors to relieve those who are in the camps and who having no friends in their villages are unable to return to them. A proposal has been submitted for the formation of a poor-house, but the necessity for this not being considered to have been made out, the proposal was negatived.

The relief workers in addition to earthwork have been employed in heaping metal and collecting ballast. The Mahlaing Camp from the Meiktila district has just crossed the border into the Myingyan district.

The general health of the relief workers and of the inhabitants of the affected tract is said to be good. Cholera has broken out in certain villages in the Kyaukpadaung, Salè and Pagan townships and 38 deaths from it have occurred.

Small-pox continues in the Taungtha township. The rate of wages paid to relief-workers was altered during the latter part of the month : wages are now calculated according to the revised Appendix XIV lately sanctioned by the Financial Commissioner with the approval of the Chief Commissioner (*vide* Revenue Secretary's letter No. 424-1-S-10, dated the 18th March 1897).

APPENDIX VI.

Monthly Famine Statement for the four weeks ending Saturday evening, the 27th March 1897.

(*Vide* Section 43 of Code.)

District.	Area.	Population.	Affected area.	Estimated population of column 4.	Numbers on Relief works on last Saturday of month.					Numbers on gratuitous relief.	Price of one or more principal food grains in seers per rupee.			Monthly death-rate.	Deaths due to starvation.
					Class A.	Class B.	Class C.	Class D.	Total.		Rice.	Maize.	Peas.		
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16
	Sq. miles.		Sq. miles.								S. C.	S. C.	S. C.		
Meiktila	2,178	217,104	1,200	70,000	...	9,457	...	...	9,457	749	8 12	17 6	22 8	3·5	...

* The large death rate is chiefly due to the mortality from cholera.

(A remarks page should be added to the statement.)

On this page should be recorded, very briefly, information as to private relief, village relief, general character of relief works, physical condition of people, deaths (if any) from starvation, food-stocks, importation of grain, general condition and prospects of affected area, changes, in rates of wages, any observations which it may be necessary to make respecting the extent to which the increase in mortality is due directly or indirectly to famine, and other matters which will not delay the despatch of the statement beyond the 15th of the following month. If the particulars regarding mortality cannot be submitted with Appendix VI., a separate mortality statement referring to the month previous to that dealt with in Appendix VI. should be submitted.

APPENDIX VII.

Monthly Famine Statement for the four weeks ending Saturday evening, the 27th March 1897.

(*Vide* Section 43 of Code.)

District.	Maximum number for whom relief is estimated to be required in case of serious famine.	Number for whom relief was provided in last programme of relief works. * Some relief works will have been more or less exhausted since the last programme was drawn up and others will have been provided for entry in the programme next to be prepared; the net result should be shown in columns 6 and 7.

† The submission of the report should not be delayed in order that accounts of expenditure may be made up to date of report.

Revenue Department.—No. 409-1S.—2.—Dated Rangoon, the 20th April 1897.

From the Revenue Secretary to the Chief Commissioner, to the Secretary to the Government of India, Revenue and Agricultural Department.

SIR,

In reply to your letter No. 685 F.-42—3, dated the 27th February 1897, I am directed to submit the following report on famine prospects in Burma. The subjects of report are dealt with in the same order as in my letter of the 8th January.

2. The area affected by scarcity remains unchanged, with the exception that the Kyaukpadaung township of the Myingyan district has been added to the famine area. The following statement gives the area at present affected :—

District.	Township.	Area in square miles.	Population.
Meiktila ...	Meiktila	300	20,000
	Thazi	200	10,000
	Mahlang	300	20,000
	Wundwin	400	20,000
	District total	1,200	70,000
Yamèthin ...	Yamèthin	102	19,500
	Pyawbwe	183	17,500
	Yindaw	624	14,000
	District total	909	51,000
Myingyan ...	Myingyan	387	84,456
	Taungtha	484	49,904
	Pagan	450	53,669
	Kyaukpadaung	552	72,042
	District total	1,873	260,071
	Divisional total	3,982	381,071

3. *Remissions of revenue.*—The following statement gives figures of collection of *thathameda* according to latest information :—

District.	Collection of Thathameda in		Estimated Collection in
	1894-95.	1895-96.	1896-97.
	Rs.	Rs.	Rs.
Meiktila	3,49,451	2,52,150	71,500
Yamèthin	3,68,885	2,93,412	1,46,022
Myingyan	5,86,228	5,05,012	1,26,968
Total	13,04,564	10,50,574	3,44,490

It will be observed that the figures of estimated collections are considerably higher than the "actual demand" shown in the statement appended to my letter

No. 557-2 T.—2, dated the 18th February 1897. The improvement is attributed to better collections than were anticipated in parts of the affected districts unaffected by scarcity.

4. *Agricultural advances.*—These advances are of two kinds :—

(*a*) Advances for small works, such as the digging of wells.

(*b*) Advances for purchase of seed and cattle.

As regards advances of the first kind, I am to say that orders were issued in January authorizing the grant of advances for digging wells, and in February the Bengal rules forwarded with your letter No. 14 F.-59—2, dated the 12th February, were adopted with certain modifications. The Commissioner reports, however, that the people have not availed themselves of the concessions offered them. Burman cultivators do not care for cultivation from wells and have in all districts refused advances for digging them.

5. As regards advances for seed and cattle, the Commissioner reports that advances to the following amounts will probably be required for :—

	Rs.
Meiktila	1,10,000
Yamèthin	90,000
Myingyan	1,00,000
Total	3,00,000

In Finance and Commerce Department Resolution No. 1,233A., dated the 16th March 1897, five lakhs are allotted to Upper Burma for agricultural advances. As the whole of the dry zone of Upper Burma has suffered severely from deficient crops, agricultural advances will have to be made on a liberal scale in other districts besides those mentioned above, and it is doubtful whether five lakhs will meet all the requirements of Upper Burma. It will probably be necessary to divert to that part of the province a considerable portion, if not the whole, of the allotment provided for Lower Burma. On this understanding the Chief Commissioner is of opinion that sufficient provision has been made for agricultural advances.

6. As regards crop prospects there is little to add to the facts reported in my letter of the 8th January. The cold weather crops of the affected area are inconsiderable and the outturn, such as it is, has been much below the average. The food-supply of these parts must continue to be drawn from Lower Burma until the wet weather crops, which will be sown at the beginning of the rains, come to maturity.

7. It remains to discuss the questions of the number of persons likely to require relief, the measures to be taken for relieving them, and the probable cost of those measures. The year 1896–97 having already expired, it is not necessary to refer to it. It is sufficient to mention that the total expenditure on famine relief up to the 31st March 1897, according to the latest information available, was Rs. 5,50,385. It is difficult to estimate with any approach to accuracy the number of persons likely to require relief in 1897–98 because the most important factor, the character of the rainfall of 1897, is unknown. If the rainfall is favourable, the Chief Commissioner believes that the number of relief-workers after June will fall considerably. It is true that the ground will produce no food till September or October, but if there is a reasonable prospect that the crops will yield well, the people will be able to borrow on their security, and they will certainly prefer to do so and attend to their agricultural operations, rather than continue on relief works. If, on the other hand, the season is unfavourable, the number on relief works will certainly increase largely. It is, however, quite impossible to forecast the extent of the increase and therefore in the following estimate the Chief Commissioner assumes that the rainfall will be normal. On this

assumption the Chief Commissioner submits the following estimate of relief-workers in terms of daily relief units :—

April	450,000
May	400,000
June	350,000
July	300,000
August	100,000
Total	1,600,000

The cost of a daily relief unit is estimated at 2 annas 8 pies. On the basis of this estimate the cost of relief works will be Rs. 2,66,666. In addition to the above expenditure, expenditure is incurred on—

(*a*) Gratuitous relief ;

(*b*) Employment of additional civil officers.

The Chief Commissioner's estimate under these heads is—

	Rs.
(*a*)	7,000
(*b*)	10,000

The total expenditure which the Chief Commissioner anticipates under all heads in 1897-98 is—

	Rs.
Relief works	2,66,666
Gratuitous relief	7,000
Civil Officers	10,000
Total	2,83,666

or, in round numbers, Rs. 3,00,000. This estimate is very considerably below that made in January, the reduction being due mainly to the fact that numbers on relief works have fallen off considerably in March and April, and that a still further decrease may fairly be expected when agricultural operations recommence in May and June.

8. As regards the arrangements to be made for affording relief, I am to say that the Chief Commissioner is not without hope that the Meiktila-Myingyan Railway will provide sufficiently for the requirements of the situation. Owing to the diminution in the number of relief-workers in March and April, the rate of progress has been slower than was anticipated in January. Assuming that relief-workers continue to diminish in numbers, the Railway ought to provide employment for a considerable time. If work on it is finished before the need for relief ceases, ample employment will be provided for all needing relief on the Mandalay and Môn Canal schemes in the Mandalay and Minbu districts.

9. In conclusion I am to remark that at the end of paragraph 10 of my letter of January, the Chief Commissioner expressed the fear that it might be necessary to open relief works in other parts of the dry zone besides the Meiktila division. He is glad to be able to report that the necessity has not arisen. Two small test works have been maintained under strict Code rules in the Magwe and Minbu districts, where scarcity was feared, but the numbers on these

works has never exceeded a few hundreds, and the works have been kept open for the purpose of gauging the character of the distress in parts of the country where crops had failed and where a certain amount of distress was known to exist.

I have, &c.,

C. G. BAYNE,

Revenue Secretary.

Exports of Rice, husked and unhusked, from 1st January, 1897, from all ports in Burma. Compiled in the Department of Revenue and Agriculture from weekly telegrams received from Collectors of Customs in Burma.

* Figures not yet available.

REMARKS.

Area affected.—Condition and prospects thereof.—The affected area has increased to 15,988 square miles against 12,754 square miles reported in the statement of the previous month. The increase is due to addition of a portion of the Vizagapatam district, and to the extension of the areas affected in Ganjám,

Anantapur and Bellary. In Ganjám, distress has not yet reached an acute stage, and the people, who in the more seriously affected tracts are to a great extent Uriyas, are averse to the discipline of relief works and prejudiced against the acceptance of relief. The numbers on relief works in that district are very small, but the extent to which it has been found necessary to give gratuitous relief to save life shows that limit of endurance without relief has been nearly reached. In Vizagapatam there was a similar reluctance to attend relief works, but after the first few had made a start on March 14th, others came with a rush, and the numbers at the end of the month were 3,550. This shows that abstention from works is not necessarily a sign that there is no distress. In both these districts, the rainfall of the month has been considerable ; but while being of but little use for cultivation purposes, it has replenished the sources of drinking-water supply, and brought into existence the normal hot weather pasturage for cattle.

In the Deccan districts, there has been no improvement, nor can any be expected before June. Agricultural operations are practically over for the present. The numbers on relief have increased by nearly 50 per cent., and are likely to mount considerably higher. The conditions of, and outlook for, cattle are decidedly poor, for although the more valuable cattle are carefully fed, the inferior kind is suffering much from want of pasturage and water.

2. *Nature of works.*—The work given is almost entirely road-work, *i.e.*, collection, breaking and stacking of metal, collection of gravel, cutting side-drains and spreading of metal and gravel.

3. *Operations under the Loans Acts.*—In addition to the numbers employed on relief works, about 13,000 are reported to be employed on land improvement works, for which over Rs. 2,00,000 have already been disbursed by the State, as shown in the subjoined table :—

Districts.	Land Improvement Loans.								Number of wells.		Estimated number of labourers employed.
	For wells.				Other purposes.						
	Accepted.		Disbursed.		Accepted.		Disbursed.		Completed.	Under construction.

Total ...	1,010	1,38,600	915	87,520	1,509	1,78,835	1,237	1,38,205	39	4,691	12,664
Grand Total .	1,010	1,38,600	915	87,520	1,550	1,84,295	1,263	1,42,105	39	4,691	12,664

4. *Wages.*—During the month the majority of relief-workers has been on B class wages, though over 20,000 have been receiving C class wages. Under the orders of Government referred to below in paragraph 8, all actual workers are henceforth to be placed on B wages, the C class being reserved for untasked labour.

5. *Gratuitous relief.*—Except in Ganjám, gratuitous relief has been confined to the offer of cooked food at kitchens, and the persons relieved have been for the most part the children or infirm dependants of relief-workers. On the last day of the month, however, Government considered that the time had come for a more extended organisation of gratuitous relief and ordered the administration of

gratuitous relief in villages, sanctioning the grant of money doles to dependants of workers who attend on works, and grain doles in villages, in those cases where the recipients are debarred by caste prejudices from attending public kitchens.

6. *Prices.*—Prices have fallen slightly in Ganjám and Vizagapatam where rice and ragi are the staple grains. But in the Deccan where cholam is the principal staple, there was, except in Anantapur and Kurnool, a distinct rise, especially in Bellary, and the tendency to rise has continued since in Bellary and Cuddapah and has been felt in Kurnool.

7. *Imports and Exports.*—Trade is fairly active as evidenced by the subjoined figures :—

IMPORTS AND EXPORTS BY RAIL.

Districts.	February.		March.	
	Imports.	Exports.	Imports.	Exports.
	MDS.	MDS.	MDS.	MDS.
Ganjám	10,600	10,200	4,000	10,700
Vizagapatam	58,600	4,300	35,200	1,200
Kurnool	9,640	1,871	14,800	3,000
Bellary	26,580	6,512	40,500	6,100
Anantapur	16,806	6,373	10,065	10,234
Cuddapah	25,311	12,878	33,281	11,140

8. *Condition of People.*—On the representation of the Sanitary Commissioner that the diet prescribed in section 120 of the Famine Code was deficient in vegetable salts, and that the grain equivalent was insufficient to provide the "other items" of the diet, Government issued orders at the close of the month to place all workers in A or B class, and untasked labourers in C class. The Government of India has been addressed in the matter. The Sanitary Commissioner considered the condition of some relief-workers who had been long on C class wages, to be unsatisfactory, but the condition of others was, on the whole, fair.

9. *Mortality.*—The following table shows the deaths in February 1897 and in the period, October—February in 1896–97, and the average rates for the same periods. Figures for March are not available :—

Districts.	Number of deaths reported.			
	During February.		From October to February.	
	1897.	Average.	1896–97.	Average.
Ganjám	2,847	*	12,392	*
Vizagapatam	2,238	2,431	12,328	15,131
Kurnool	916	1,289	5,801	7,081
Bellary	1,218	1,395	6,956	6,882
Anantapur	922	812	5,585	4,802
Cuddapah	1,827	1,864	10,406	11,790

*Figures not available.

The death-rate during February was below the average everywhere except in Anantapur, but in Bellary and Anantapur, the average was exceeded for the period

for October—February, being noticeable only in the case of the latter district and the three most affected taluks of Bellary. Any inference from the figures would, however, be possibly misleading, for the rates entered are considerably below those to be expected when a comparison is made with census statistics. The Sanitary Commissioner, however, is of opinion that "it is possible that a marked decrease of fever in malarious districts may follow a drought and that mortality may be exhibited in reference to scarcity by its influence on the very old and the very young."

Famine Statement B.

For the period ending Saturday the 27th March 1897.

BOMBAY.

No. 1098 (Famine), dated Bombay Castle, the 26th April 1897.

From the Honourable Mr. J. Monteath, I.C.S., Chief Secretary to the Government of Bombay, Revenue Department, to the Secretary to the Government of India, Department of Revenue and Agriculture (Famine).

In accordance with No. 2 of the rules circulated with the Resolution of the Government of India, No. 5—48, dated 2nd March 1892, and printed in Appendix II. of the Bombay Famine Relief Code, I am directed to submit for the information of that Government the Famine reports for the month of March 1897 from all the Collectors of the affected districts where relief measures are in progress. The reports are in the forms prescribed by Rule VI. of those rules. As there is no change in the affected areas no maps have been sent.

2. I am to state that the Collectors of Poona and Ahmednagar have been asked to furnish explanations in regard to the figures of gratuitous relief shown in column 12 of Statement E for their respective districts, which cannot be reconciled with the figures reported in their weekly returns, and that any alterations which may be necessary will be reported to the Government of India.

Monthly Famine Statement E. for the four weeks ending Saturday evening, the 27th March 1897.

* Exclusive of establishment and other charges.

† The Collector reports that this amount does not include the amount distributed in Khandála Petha as the return from that petha has not yet been received.

‡ The Collector reports that the expenditure on relief of dependants has not been separately accounted for. The amount entered in this column represents the expenditure incurred on gratuitous relief in villages and poor-houses.

§ The Collector reports that the figures in these columns are exclusive of the figures for 12 works in progress, the revised estimates for which are under preparation.

Bombay Castle, 21st April 1897.

J. MONTEATH, Chief Secretary Government.

REMARKS TO ACCOMPANY MONTHLY FAMINE STATEMENT IN FORM E FOR THE FOUR WEEKS ENDING SATURDAY EVENING THE 27TH MARCH 1897.

(*a*) *Private relief.*—Generally *nil* except in Bijápur, Násik and Sholápur. In Bijápur in addition to this kind of relief reported last month, the Bombay Branch of the Indian Charitable Relief Fund sent Rs. 10,000, out of which clothing is being distributed to the poor. In Násik there are several "Sadávartás and Annachatrás" where cooked food and grain doles are given as usual to travellers and others in need of food. In Sholápur the distribution of grain continues as before; a further allotment has been received from the Charitable Relief Fund and is being expended on the relief of purdah women and in providing clothes to destitute persons.

(*b*) *Village relief.*—This kind of relief is given in 484 out of 717 villages in the Sholápur District, and in 322 villages in the Poona District. In Bijápur the total number relieved was 237,099 inclusive of village servants and of 6,018 persons relieved gratuitously by Municipalities. The number relieved in Sátára was 23.

(*c*) *Poor-house relief.*—A poor-house has been opened by the Bijápur Municipality at Bijápur in addition to the Government poor-house already existing there. A branch poor-house has also been opened at Naladvad. The management of the poor-house at Pandharpur in the Sholápur District has been taken over by the Pandharpur Municipality. Poor-houses have been opened at Nagar, Ráhuri, Kopargaon, Sangamner, and Jámkhed in the Ahmednagar District.

(*d*) *General character of relief works.*—The relief works consist mainly of the construction of new and improvement of existing roads, breaking and collection of metal, and construction of tanks for irrigation. As many works of the last class as are likely to be permanently useful in the affected areas are being undertaken. There are also Railway earth-works in the Khándesh and Sholápur Districts.

(*e*) *Physical condition of the people.*—Generally good; but a few cases of cholera and small-pox are reported to have occurred in the Bijápur and Sholápur Districts. Measures have been taken to prevent the spread of the diseases.

(*f*) *Deaths (if any) from starvation.*—Nil.

(*g*) *Food stocks.*—Generally sufficient.

(*h*) *Importation of grain.*—Generally sufficient. It is reported that in Sátára the imports of grain are increasing and in Khándesh they are larger than they were three months ago. In Bijápur there is comparatively very little grain imported or exported.

(*i*) *General condition and prospects of affected areas.*—In Sholápur there was an appreciable increase in the numbers on relief works during the month. In Sátára and in parts of Khándesh there has also been a steady increase in the numbers applying for relief. In Bijápur there is now very little employment for labourers on ordinary agricultural operations, but the recipients of tagái have employed large numbers. The reports for Poona point to increased stress in the west.

(*j*) *Changes in rates of wages.*—The wages given depend on the prices of the staple food-grains. In Bijápur the rates of wages and prices are steady. In Sholápur there was a slight rise in the prices of food-grains, the maximum and minimum wages paid in that district being 2 annas and 7 pies and 1 anna and 3 pies respectively. The maximum and minimum wages in the Ahmednagar District were 2 annas and 1¼ annas respectively. Copies of statements showing the rates of wages in Khándesh and Sátára are appended.

J. MONTEATH,

Chief Secretary to Government.

Bombay Castle, 21*st April* 1897.

No. 1259-F., dated Bombay Castle, the 1st June 1897.

From the Honourable Mr. J. Monteath, I.C.S., Chief Secretary to the Government of Bombay, Revenue Department, to the Secretary to the Government of India, Revenue and Agricultural Department.

In accordance with No. 2 of the rules circulated with the Resolution of the Government of India, No. 5-48, dated 2nd March 1892, and printed in Appendix II. of the Bombay Famine Relief Code, I am directed to submit for the information of that Government the famine reports for the month of April 1897 from the Collectors of all the affected districts where relief measures are in progress. The reports are in the form prescribed by Rule VI. of the rules mentioned above. As there is no change in the affected areas no maps have been sent with this letter.

Monthly Famine Statement E. for the four weeks ending Saturday evening the 24th April 1897.

Bombay Castle, 28th May 1897.

J. MONTEATH, *Chief Secretary to Government.*

REMARKS TO ACCOMPANY MONTHLY FAMINE STATEMENT IN FORM E, FOR THE FOUR WEEKS ENDING SATURDAY EVENING THE 24TH APRIL 1897.

(*a*) *Private relief.*—Private relief from the Indian Famine Charitable Relief Fund is given in Poona, Ahmednagar, Sholápur and Bijápur in the form of clothing to relief workers, recipients of the gratuitous dole and other poor people, and of extra food to the old and infirm and to children in a reduced condition. In the Bijápur district the municipalities of Guledgud, Ilkal, Bijápur and Bagálkot continue to give gratuitous relief within their limits, and grain shops for the poor have been opened in Muddebihal and Talikot.

(*b*) *Village relief.*—This kind of relief was given during the month in 500 villages in the Sholápur and in 486 villages in the Poona district. In Bijápur the total number so relieved was 259,639 inclusive of village servants and 7,957 persons relieved by municipalities. The number so relieved in Sátára was 46 on the average. The number in receipt of this kind of relief in the Násik, Dindori, Málegaon, Igatpuri, Sinnar and Niphad tálukas of the Násik district on the 24th April 1897 was 173.

(*c*) *Poor-house relief.*—The poor-houses opened at Kopargaon, Sangamner, Akola, Shrigonda and Jamkhed in the Ahmednagar district have been closed owing to the absence of demand for relief in this manner. In the districts of Sholápur and Bijápur poor-house relief continues as before.

(*d*) *General character of relief works.*—There is little to add on this subject to the report for the preceding month. As far as possible metal-breaking works are being closed and labour is being concentrated on railway earth-works or irrigation works. In the Bijápur district a large number of labourers continue to find employment on works undertaken by recipients of takávi advances.

(*e*) *Physical condition of the people.*—Generally good; in the western part of the Poona district some of the poorer people are reported to be in a somewhat reduced condition. Cholera prevailed during the month in parts of Bijápur, in 7 tákulas of Sátára and in all tákulas of Sholápur except Karmala; but except on two works in Sátára and on one work in Bijápur and Sholápur respectively there were no cases in the relief camps. Small-pox was prevalent at the end of the month in the Malsiras táluka of the Sholápur district. Measures have been taken to prevent the spread of the diseases.

(*f*) *Deaths (if any) from starvation.*—None.

(*g*) *Food stocks.*—Generally sufficient except in a few isolated villages in the Bijápur district, where it is reported that the supply is failing.

(*h*) *Importation of grain.*—Owing to the abatement of the plague the import and export traffic of the Poona City has resumed its normal course. In Sátára and Khándesh the imports have increased. As for the other districts there is no change to report.

(*i*) *General condition and prospects of affected areas.*—The numbers of people on relief works and especially of dependants have gradually decreased in most of the districts in the course of the month as a result of the introduction of kitchens for the relief of dependants and of the concentration of labourers on large works, which involves the closing of works near the homes of many. In the eastern and central parts of Poona the general condition is such that the first fall of rain will probably dispense with the need of relief being continued in any form; but in the western part, where the smaller cultivators are at the end of their resources, relief measures may have to be continued longer. At the same time the practical cessation of the plague in Bombay has enabled many labourers and others from the western tracts of Poona to go there for work as usual. In Bijápur recent rain has induced a few of the cultivators to plough their fields and large numbers of people have applied for tagai advances for purchase of seed and cattle. Scarcity of water is increasing in the Bijápur and Sholápur districts, and measures have been taken to improve the water-supply. In Ahmednagar the general condition is reported to be satisfactory.

(*j*) *Changes in rates of wages.*—In Poona, Khándesh, Ahmednagar and Násik there was no change in the rates of wages given. In Bijápur there was an increase in some tálukas owing to a rise in the prices of food-grains, while in Sholápur there was a slight fall in prices and consequent decline in the rates of wages, which varied from 2 annas 7 pies to 1 anna 2 pies. A copy of the statement showing the rates of wages in Sátára is appended.

J. MONTEATH,
Chief Secretary to Government.

BERAR.

No. 404, dated Chikalda, the 1st April 1897.

From Major R. V. Garrett, Officiating Director of Land Records and Agriculture, Hyderabad Assigned Districts, to the Secretary to the Government of India, Department of Revenue and Agriculture.

I have the honor to submit the accompanying statements prescribed by the circular of the Government of India in the Revenue and Agricultural Department, No. 5–48, dated the 2nd March 1892, for the month of February 1897, and to express my regret in not being enabled to submit them on due date owing to the late receipt in my office of District Reports.

2. Arrangements have, however, been made for the punctual submission of these statements in future, and it is hoped that the statistics required for the month of March 1897 will be despatched in time to be received by the Government of India on the date prescribed.

Monthly Famine Statement E for the four weeks ending Saturday evening, the 27th February 1897.

District.	Area.	Population in thousands.	Affected area.	Estimated population in thousands of column 4.	Numbers on relief works on last day of month.						Number on gratuitous relief.	Price of one or more principal food grains in Pounds per Rupee.		
					Class A.	Class B.	Class C.	Class D.	Working children.	Total.		Jowari.	Wheat.	—

AKOLA,
The 1st April 1897.

R. V. GARRETT, *Major*,
Offg. Director of Land Records and Agriculture.

REMARKS.

Private relief.—No private relief was afforded.

Village and poor-house relief.—Nil.

General character of relief works.—Improvement of tanks, roads, and in addition stone breaking.

Physical condition of the people.—Fair.

Deaths from starvation.—Nil.

Food stocks.—Sufficient for the present.

General.—There were larger imports of food grains than exports during the month. The effect of high prices on the poorer classes has been disastrous, food grains double their normal price and want of labour has made the labourers flock to the relief works opened, but these are insufficient to meet the wants of all. The rates of wages have been less than the Famine Code wages paid by the District Board, and the Code rate wages by the Public Works Department based on the prevailing rates of Jawar.

Monthly Famine Statement E. I. for the four weeks ending Saturday evening the 27th February 1897.

AKOLA :
The 17th April 1897.

R. V. GARRETT, *Major*,
Offg. Director of Land Records and Agriculture.

No. 674, dated Akola, the 27th April 1897.

From Major R. V. Garrett, Officiating Director of Land Records and Agriculture, Hyderabad Assigned Districts, to the Secretary to the Government of India, Department of Revenue and Agriculture.

In continuation of this office letter No. 626, dated the 17th April 1897, I have the honour to submit herewith the accompanying statements giving the supplemental information in respect of the Akola and Buldana districts for the month of March 1897, as prescribed by Appendix II. of the Famine Code.

Monthly Famine Statement E for the four weeks ending Saturday evening the 27th March 1897.

District.	Area.	Population in thousands.	Affected area.	Estimated population in thousands of column 4.	Numbers on relief-works on last day of month.						Numbers on gratuitous relief.	Price of one or more principal food-grains in pounds per rupee.

AKOLA,
The 27th April 1897.

R. V. GARRETT, *Major*,
Officiating Director of Land Records and Agriculture.

Akola District.

No private relief had been afforded in the district.

Four poor-houses were opened in the district during the month.

The relief works opened out and continued were :—

Diversion of Shahnur nalla, Tank at Erandleh, Telhárá-Arsul road. Breaking stones at Akola stone quarry, Bodkha, Khadki, Kanberi, Barsi, Takli, breaking stones for Paras-Ballapur-road, breaking stones for roads in town Jalgaon and removing silt from the Janoona Tank.

The physical condition of the labourers is fair.

One death from starvation is reported. The food stock in the district is sufficient but prices are high.

There were larger imports of food-grain than exports during the month.

The effect of high prices on the poorer classes remains unchanged, *i.e.*, disastrous.

The rates of wages have been paid according to the Famine Code.

Non-working children and adult dependants were not paid during the month.

Monthly Supplementary Famine Statement E.I. for four weeks ending Saturday evening, 27th March 1897.

District.	Area.	Population in thousands.	Affected area.	Estimated population in thousands of column 4.	Monthly death rate.	Deaths due to starvation.	Remarks.

No. 130, dated Hyderabad Residency, the 26th May 1897.

From Arthur F. Pinhey, Esq., C.S., Secretary for Berar to the Resident, Hyderabad, to the Secretary to the Government of India, Department of Revenue and Agriculture, Simla.

Referring to letter No. 674, dated the 27th April 1897, from the Director of Land Records and Agriculture, Hyderabad Assigned Districts, to your address, and in pursuance of the instructions conveyed in Mr. Holderness' letter No. 1104-F., dated the 21st April 1897, I am directed to submit the monthly statements relating to the Amraoti District for the month of March 1897, prescribed in the circular of the Government of India in the Department of Revenue and Agriculture, No. 5—48, dated the 2nd March 1892.

2. The report for April 1897 has had to be returned for revision, and the revised report will be submitted to the Government of India as soon as it has been received from Berar.

Monthly Famine Statement E for the four weeks ending Saturday evening, the 27th March 1897.

(Sd.) R. MANDUIT,

for *Deputy Commissioner*,

Amraoti District.

REMARKS.

(1) Private relief; village and poor-house relief.	(1) There were two Government poor-houses during the month. The poor-houses were not open during the whole month. Besides the Government poor-houses there were two so-called poor-houses kept up by private subscriptions, where cooked food was distributed. In some villages private relief was afforded.
(2) General character of relief-works.	(2) Water supply and road-making. Three relief-works were started during the month.
(3) Physical condition of the people.	(3) Generally good. Many of these coming from the surrounding districts of the Central Provinces are incapable of labour and are in receipt of gratuitous relief, both Government and private.
(4) Food-stocks.	(4) Sufficient.
(5) Importation of grain.	(5) 56,094 maunds of food-grain were imported by rail during the period. Statistics for road-borne imports not available.
(6) General condition and prospects of affected area.	(6) Famine will cease altogether after a good fall of rain.
(7) Changes in rates of wages.	(7) No change. Jowari was taken as the basis of calculation.
(8) Deaths from starvation.	(8) Not reported. Will be furnished in future returns, but probably very few, if any.

Monthly Famine Statement E-1 for the four weeks ending Saturday night, the 27th March 1897.

Extract from the Proceedings of the Government of India in the Department of Revenue and Agriculture (Famine), No. $\frac{20\text{-}F.}{157-1}$, *dated* 12*th May* 1897.

RESOLUTION.

The Government of India, being anxious to collate for future guidance the experience obtained during the present famine in different parts of India in the conduct of famine relief works, have decided to depute for a few weeks an officer with special qualifications to visit the provinces in which relief works are in progress, and with the permission of the several Local Governments to inspect typical works and to make such enquiries as he finds necessary. While there is no doubt that in the present famine everywhere relief operations on an immense scale have been conducted with much greater completeness and facility than on any previous occasion, the very precision and completeness of organization has in more than one province given rise to difficult problems. The two principles underlying the relief work system is on the one hand to give employment suited to their capacity to those who would otherwise starve, and on the other hand to offer no inducements to those who can otherwise support themselves to come upon the State for relief. These two principles prove difficult to reconcile in practice, and expedients have been adopted in different places which more or less involve modifications in the provincial Famine Codes, and which, so far as the Government of India have been able to ascertain, have been attended with varying degrees of success. It is desirable that these experiences should be gathered up while they are still fresh, and that difficulties in the working of the present codes which have been brought to light should be investigated by an officer placed in a position to compare the relief work systems of different provinces.

2. The officer whom the Government of India propose to depute for the purpose is Mr. T. Higham, C.I.E., Deputy Secretary to the Government of India in the Department of Public Works. Mr. Higham will use his own discretion as to the scope of his enquiry, but among the matters to which he will particularly direct his attention the following may be specified. The general character, size and permanent utility of the relief works in progress or held in reserve; the system of management and supervision adopted; the place respectively held in the scheme of relief operations by relief works managed by the Public Works Department and by relief works managed by civil officers; the sufficiency of the staff at the disposal of the Public Works Department to meet the demands upon the Department; the respective limits of the authority of the Public Works officer in charge of a relief work and of the civil officer associated with him; the character and sufficiency of the labour and other self-acting tests imposed on the relief workers; the ratio borne by the tasks exacted to the work commonly performed by labourers under ordinary conditions; the mode of classifying, and the rates of wages received by, the relief workers; the nature of the provision, by money doles or relief kitchens, made on the works for dependants and non-working children; the extent to which it has been found practicable to allow piece-work for special gangs or in special localities, and the conditions under which it has been introduced or has proved preferable to task work. As complaints have been made by railway administrations and private persons that on account of the popularity of famine relief works among the labouring classes, difficulty has been experienced by them in obtaining labour this year under ordinary contract conditions, Mr. Higham will also endeavour to ascertain whether there is any truth in these complaints, and what (if any) are the causes which give popularity to Famine Code relief works, and what precautions have been taken to prevent them from competing improperly with ordinary public works on which able bodied and efficient labourers may earn even with grain-prices at their present level a wage sufficient to support themselves and their families.

3. Mr. Higham's duties will be strictly confined to those of an officer deputed by the Imperial Government to inspect, and to obtain information from Local Governments and from authorities authorised by them to communicate with him. He will not interfere in any respect with the administration of famine relief, nor will he offer advice or suggestions to Local Governments on any matter coming

under his observation except at their request. He will address his reports direct to the Government of India, but, if so requested by a Local Government he will communicate to it for information an advance copy of his report on the relief works of the province. The Government of India wish it to be clearly understood that they have complete confidence in the ability of all the Local Governments to conduct their relief system successfully and economically in accordance with the recognised principles of famine relief, and that they do not contemplate any action which would fetter Local Governments in any respect or relieve them of the responsibility placed upon them by the local Famine Codes. But the present year is the first in which the rules for the conduct of relief works formulated on the report and recommendations of the Famine Commission have been put to practical test on a large scale simultaneously in all parts of India, and in which a comparison of their actual working in different provinces can be effectively made. Having regard to the magnitude of the operations now in progress and to the fact that the expenditure on famine relief works approaches 50 lakhs of rupees a month, the Governor-General in Council considers that the collection of information by an officer specially qualified is highly desirable and feels sure that Local Governments will gladly afford him all facilities in the matter.

4. Mr. Higham's deputation will commence on his arrival in Bombay on the 15th of the month, on return from privilege leave. It will be convenient that he should visit the relief works in the Bombay Presidency before proceeding to the Upper Provinces, and he accordingly has been directed to report himself on arrival to the Government of Bombay. He has also been instructed to communicate the dates of his tour in advance to the several Governments.

ORDER.—Ordered that a copy of this Resolution be forwarded to Mr. T Higham, C.I.E., Deputy Secretary to the Government of India, Public Works Department, for information and guidance and to the Local Governments and Adminstrations noted in the margin for information.

Secretary to the Government of Madras.

Ordered also that copy be forwarded to the Foreign, Finance, and Public Works Departments, for information.

By order,

T. W. HOLDERNESS,

Depy. Secy. to the Government of India.

Famine, No. 28, Simla, the 28th April 1897.

Letter from His Excellency the Governor-General of India in Council, to the Right Honourable Lord George F. Hamilton, Her Majesty's Secretary of State for India.

MY LORD,

In continuation of our Despatch No. 15 (Famine), dated the 17th March 1897, we have the honour to forward returns of the mortality in each Province in which distress exists. The returns show the monthly death-rates up to the end of February for all Provinces excepting Madras and the Berars. From the two Provinces last named the special return for February is still due.

2. In our telegrams of the 16th and the 23rd April we have already, in accordance with Your Lordship's request, reported the mortality in January and February of those districts in which the rate is much in excess of the normal. We now enclose, for Your Lordship's information, copy of a letter* from the Chief Commissioner of the Central Provinces regarding the high death-rate of some of the districts in that Province. The Chief Commissioner is unable at present to

*No. 638C., dated 15th April 1897.

assign any special reason for the very high mortality in the Jubbulpore district, especially in the Murwara sub-division, beyond the fact that distress is there more intense than in any other part of the province. In accordance with our instructions a special inquiry is being made by the district authorities in communication with the Sanitary Commissioner, with a view of separating the deaths of residents of the district from those of wanderers and of ascertaining the particular registration circles in which mortality has been exceptionally heavy. As exaggerated statements as to the number of deaths occuring in India in the present season of distress not unfrequently appear in the public press it may be well to point out that the population of the Murwara Tahsil is only 173,000, of the entire Jubbulpore District 758,000, and of the Mandla District 339,000. An extraordinarily high death-rate, in a small area for a portion of the year does not imply so great a destruction of life throughout India through distress as is sometimes assumed. We do not in any way seek to minimise the concern with which exceptional mortality in any area however small should be viewed, but we think that the relative proportion of things is sometimes lost sight of. In spite of wide prevailing scarcity and distress the present monthly death-rate of British India as a whole shows little excess over the normal.

3. In the concluding paragraph of the Chief Commissioner's letter in which it is stated that the scheme of relief operations in the Murwara sub-division of the Jubbulpur District has been revised with a view to reach every part of the area, we may mention that besides strengthening the Civil, the Medical and the Public Works staff, we have placed at the disposal of the Chief Commissioner the services of twelve commissioned military officers to aid the civil authorities of the more distressed districts in the work of inspection and the superintendence of relief-works and gratuitous village relief. This form of assistance has been found to be of the utmost value both in the Central Provinces and in the North-Western Provinces and Oudh, and we are prepared to at once increase the number of officers deputed to the Central Provinces should the Chief Commissioner think that more could be usefully employed. He considers that at present the staff at his disposal is in all respects sufficiently strong, and that adequate measures of relief have been taken in all the distressed districts. We believe that this is the case and we do not consider that the existence of a high rate of mortality in a district necessarily indicates that the relief arrangements are insufficient. In the North-Western Provinces and Oudh, where from the first a very powerful staff has been at the disposal of the Local Government, where communications are excellent and all other circumstances are favourable, and where relief has been administered with the utmost completeness and thoroughness, the death-rate of several districts has been persistently above 50 per mille per annum, and this high rate is held by the Lieutenant-Governor to be sufficiently explained by the exceptional character of the year and by the severity of the distress which the Government is striving by all the means at its command to mitigate. In the Central Provinces the difficulties of the situation are very much greater. It is not only a question of organising relief but of inducing the people to avail themselves of it. The population is sparse in many parts and the areas to be explored by the relief officer large and difficult of access. The wilder tribes are prone to wander and to subsist on unwholesome food. Much of the excess mortality in the Central Provinces has occurred in poor-houses and in relief centres, to which exhausted wanderers congregate or are consigned by the police and the relief officers. Immigration from Native States has now, it is reported, been greatly stopped, but in the past this has also swelled the poor-house population and the mortality of poor-houses and relief centres. A good deal has also been done to induce the wild forest tribes to come to the relief-works, and to accept other forms of relief. For these reasons we are disposed to think that the mortality may diminish in the immediate future, though should it continue, we should not consider that it necessarily implied a failure on the part of the administration. We have, as we have already said, taken the utmost care to satisfy ourselves that all that can be done to relieve the unavoidable privations of the people is being done by the Chief Commissioner and his officers.

We have the honour to be,

(Signed) ELGIN,

&c., &c.

(ENCLOSURES WITH THE ABOVE.)

No. 638-C., dated Pachmarhi, the 15th April 1897.

From M. W. Fox-Strangways, Esq.. I.C.S., Officiating Chief Secretary to the Chief Commissioner, Central Provinces, to the Secretary to the Government of India, Department of Revenue and Agriculture.

In continuation of my letter No. 476-C, dated the 25th March 1897, I am directed to submit a statement, received from the Sanitary Commissioner, showing the mortality statistics of the Central Provinces for the month of February 1897. The delay which has occurred in the submission of this statement, and which the Chief Commissioner regrets, has been partly due to the necessity for scrutinizing some of the very high figures reported.

2. The Murwara registering circle (the Murwara tahsil of the Jubbulpore District) again shows by far the highest death-rate, the excess over the normal being 14·0, and over last month's figure 5·9. Mandla also, and the remainder of the Jubbulpore District, show large excesses over the normal figure, though in the case of Jubbulpore there has been no increase over the rate reported for January. Seoni, Balaghat, Saugor and Damoh all show high rates, though in all four the rates are below those of January. In all these latter districts, however, the distress is, it is well known, acute, and the rates are not higher than might be expected under the circumstances. As regards the first three, I am to say that in Mandla no less than 363 deaths occurred from cholera, and that if these be deducted the death-rate falls to 5·4 per mille. In this district, one of the most severely distressed in the Provinces, the administration of relief is, owing to the large area to be dealt with, the imperfect means of communication, the scattered population, and the shy and suspicious character of the aboriginal tribes, particularly difficult.

3. There remain the two registering circles forming the Jubbulpore District. In these also cholera has been present, but not to an extent that would appreciably affect the figures. The Chief Commissioner is not at present in a position to assign any special reason for the very high mortality in this district beyond the fact that the distress there is undoubtedly more intense than in any other part of the Provinces. But I am to submit, for the information of the Government of India, copy of my letter No. 581-C., dated the 9th April 1897, from which it will be seen that a special enquiry, as suggested in your letter No. 904—26-11-F., dated the 24th March 1897, has been ordered. I am further to say that the Murwara tahsil has recently been visited by the Commissioner and the scheme of relief operations thoroughly revised with a view to reach every part of the area, and that Mr. Lyall hopes to visit it himself before the end of the current month.

No. 581-C., dated the 9th April 1897.

From M. W. Fox-Strangways, Esq., I.C.S., Officiating Chief Secretary to the Chief Commissioner, Central Provinces, to the Commissioner, Jubbulpore Division.

With reference to paragraph 6 of Mr. Anderson's summary of the district reports accompanying the monthly Famine statements A and B for the Jubbulpore Division for February last, in which he deals with the mortality of each district in January as a whole, and the deaths specially ascribed to privation in particular, I am directed to forward an extract (paragraph 3) from a letter No. 904—26-11-F., dated the 24th March 1897, from the Government of India, in the Revenue and Agricultural Department, in which they ask that some further enquiry should be made into the high death-rate prevailing in the Jubbulpore District in January.

2. The recent instructions (conveyed in Mr. Priest's circular No. 1400, dated the 4th March, subsequently revised and supplemented on the 31st March) regarding the return of mortality in distressed districts will have supplied full information for each reporting circle for the month of March; but the Chief Commissioner thinks that the enquiry now ordered should include, not only the

month of January, but also that of February as well. The enquiry should be made in communication with the Sanitary Commissioner. The returns of each circle should be examined, and the deaths for each classified by clauses as in the usual monthly statements ; but in addition to the details thus given, those regarding deaths in poor-houses and those ascribed to want of food, as set forth in paragraph 4 of circular No. 1400, should be reported.

3. It will, the Chief Commissioner hopes, be found possible to distinguish deaths of wanderers from those of the resident station house population ; and in the case of deaths in poor-houses to distinguish (*a*) immigrants from Native States, (*b*) immigrants from the North-Western Provinces, and (*c*) immigrants from other Central Provinces districts from deaths of residents of the district. These details should all be ascertainable from the poor-house registers. Whether in the case of relief centres this information can be given the Chief Commissioner does not know ; but if it can it should be. Any additional temporary establishment that may be needed for the purpose of abstracting and compiling this information may be entertained as you may find necessary.

4. The results of the enquiry should be laid before the Sanitary Commissioner, who will favour the Chief Commissioner with any observations upon them resulting from his examination, as desired by the Government of India. I am to request that the matter may be taken in hand as soon as possible.

Statement showing the death-rate for the month of February and ten previous years.

(Famine, No. 33) Simla, the 18th May 1897.

From the Government of India to the Secretary of State for India.

My Lord,

In paragraph 8 of Your Lordship's Revenue Despatch No. 10, dated 15th January 1897, you wrote as follows :—

"I agree in your view, which was that expressed by the Famine Commission, that the trade as a whole can supply the food demand better and more effectively than Government could; and if reliance is placed on the trade, its operations so long as they are effective, must not be subjected to competition by Government agency. No doubt careful watch will be kept by your Government, not only on the food supply generally, but its local distribution. The area in India possessing a surplus of food is unhappily not so extensive this year as it was in 1876–77."

Subsequently you enquired, in your telegram dated 3rd February 1897, what our latest information was as to the food-stocks of India, and what measures we contemplated in case we were not satisfied that they were both sufficient for any probable emergency, and capable of timely distribution. To this enquiry we sent a brief telegraphic reply on the 6th February 1897. But the subject is one of such capital importance that we think it right to lay the facts and our views in the matter before Your Lordship with greater fullness than is possible in a telegram. We need hardly assure you that it is also one which has for many months past engaged our anxious attention.

2. As regards the internal distribution of such supplies as are in the country, we feel no anxiety whatever. Nothing has been more striking in the development of the present famine than the manner in which advantage has been taken by private trade of the improved railway communications, the promptitude with which grain has been moved from one part of the country to another in response to local fluctuation of prices, and the practical uniformity of rates which consequently prevails over the whole of Northern and Central India, the rates current in the most severely distressed tracts differing but little from those prevailing in neighbouring districts where no failure of crops has taken place. There are no doubt isolated localities to which, owing to the existence of special local conditions, this general rule does not apply. But they are not so numerous or so extensive as to present any serious difficulty in dealing with them. We have already, in our letter to the Bengal Government, of which we enclose a copy, and which has been communicated to Local Governments for information and guidance, laid down the circumstances under which interference with private enterprise is allowable and necessary, and have given the provincial authorities full discretion to take such action as may be requisite. We believe that they are fully alive to the importance of the subject; and already in several instances which have come to our notice steps have been taken to supplement in special localities the deficient activity of the local traders. We have arranged for the collection and publication of weekly figures showing the exports and imports of food-grains and pulses by rail and river for every district in India; and under the circumstances already explained, any sudden rise of prices materially above the rates prevailing in surrounding districts would at once attract attention, as indicating a failure of the local machinery of supply.

No. 104 of 4th January 1897.

3. The problem of estimating the extent and sufficiency of the general food-stocks of the country as a whole is far more difficult. Estimates of production and consumption, when applied to an infinite variety of conditions, must necessarily be of the roughest description; and it is practically impossible to obtain reliable statistics of the actual stores of grain which are held at any moment by the people. Any attempt on the part of Government to institute a formal and detailed inquiry on the point would not only tend to the true facts being carefully concealed and misleading information supplied, but would also create apprehension in the minds of native traders as to the intended action of Government, which would probably have the most disastrous results. At the same time, a very fair idea of the general sufficiency of stocks may be arrived at by quiet but persistent local enquiry, by watching the course of trade and prices, and by consulting the great dealers who have means of ascertaining the facts which we do not possess, and who will not misunderstand the object of our questions. Of

these sources of information we have availed ourselves to the full, and shall continue to do so; and the general conclusion at which we have arrived is that the existing food-stocks, replenished by the spring harvest which is now entering the market, and supplemented, as they have been, from the surplus rice-stocks of Lower Burma, will certainly suffice to carry us through until the next autumn harvest, with a considerable margin in hand. If the grain traders of the country believed that it was entirely dependent on the next autum harvest for its food from autumn to spring, not only would prices, in the face of so grave a risk, be very greatly higher than they are at present, but there could be none of that tendency to fall, which is now apparent in all the great provinces of India, except Bengal.

4. The grounds on which we base this conclusion may be briefly summarised as follows:—

In the Punjab the stocks in hand before the ingathering of the autumn harvest of 1896 were computed by the Director of the Land Records Department to be enough to carry the province over till the middle of April 1897. Since that estimate was made the autumn harvest has been returned at two-thirds of an average yield, regard being had both to the restricted sowings and to the exceptionally poor yield in many parts of the province, and this yield has been computed to have provided additional food for the population for about three months. Detailed statistics of the area under cold weather crops in the province in 1896–97 have not yet reached us, but approximate estimates show that in many districts the area under crop represents a very considerable proportion of the normal area, and that owing to timely rainfall in March and April the harvest in the northern districts is better than was at one time expected. Our latest information is that as the new grain finds its way into the market from the threshing floors prices are now falling throughout the province. As the food-grain production in the Punjab is in ordinary years largely in excess of the requirements of the province, as shown by a net average export of 500,000 tons a year, it may be reasonably inferred that last year's autumn harvest and the present spring harvest, added to the stocks existing in September last, will not only suffice for the requirements of the province till the next autumn harvest is reaped, but will leave a considerable margin for export to other provinces.

5. In the North-Western Provinces and Oudh the outturn of the cold weather crop just harvested is estimated, regard being had both to condition and area sown, at two-thirds of the normal. This will represent at least four months' food-supply for the population of the province. The province, which in ordinary years produces, according to the returns of imports and exports, a moderate food-grain surplus, has during the last two years been importing, and is still importing, from other provinces. But even before the harvesting of this year's cold weather crop considerable food-stocks were believed to exist with grain-dealers, and with agriculturists in the fertile canal districts. It may therefore be inferred that, with the addition made to those stocks by the present harvest, there will be sufficient food in the province as a whole till the next rain crop. The Government of the North-Western Provinces and Oudh has no anxiety on this head. It may be mentioned that since January last the imports of Burma rice into the Bundelkhand Districts and into Southern Oudh have been on a large scale. For the four months ending the 30th April 75,000 tons, or food-supply for $1\frac{1}{4}$ millions of persons for the period, have been so imported, and the monthly famine reports show that Burma rice is largely sold in the relief camps and has made its way into the village bazaars. This may indicate the exhaustion of local food-stocks in the particular districts of the province where the import has been largest, and we believe that up to the recent harvest this was the case. But it also indicates that other districts outside this distressed area have not been drawn upon to supply this deficiency from their reserves to the same extent as they would if private trade had not resorted to Burma.

6. In Bengal the yield of the great rice crop of the province has been very poor The crop, including both the autumn and the winter rice, occupies about 40 million acres, and in ordinary years represents over 20 million tons of cleaned rice. In the present season the yield on a somewhat smaller area is returned by the Agricultural Department at 9 million tons, the deficiency below the normal

being put at no less than 11 million tons. The agricultural returns of Bengal are less reliable than those of other provinces, and it is possible that the rice crop has been somewhat better than is reported. But whether this be the case or not, all the evidence before us tends to prove the existence of considerable stocks of rice in the country, apart from the winter crop of 1896–97 which in any event must represent several months' food-supply. Burma rice has been steadily imported into Behar since January last, the total imports for the four months ending the 30th April aggregating 45,000 tons and representing food for three-quarters of a million of the population for that period. This has undoubtedly helped to steady prices in the affected districts. Throughout Behar the cold weather crops of wheat, barley and peas, which were harvested in March and April last, were fully up to the average, though owing to the dryness of the soil in October the area sown was below the normal. Allowing for deficiency in area the outturn has been returned at two-thirds of the average. Though these crops are relatively of less importance in the province of Bengal as a whole than in any other province, still they occupy the not inconsiderable area of ten million acres, and in particular districts—notably in South Behar and in the Bhagulpur Division—they represent one-third or one-fourth of the total food crop area. In these districts, since the new grain has come into the market, wheat is selling at 9 and 10 seers the rupee and barley at 13 and 14. These are considerably easier prices than ruled in November last.

7. In the Central Provinces the Chief Commissioner reports that though, as compared with the past, food-stocks have been considerably depleted, reserves still exist in the richer districts, and that the province as a whole is fairly well supplied. The best estimates which we can form of the effect of the recent cold-weather harvest on existing stocks is that it added to them about three months' food-supply for the total population of the province. The question is complicated by the fact that in some districts rice and other rain crops are almost exclusively grown, while in others wheat forms the staple crop. But this is a matter of distribution rather than of actual supply.

8. With regard to Madras and Bombay, the defect below the normal of the earlier and later crops of 1896–97 is undoubtedly large in the affected districts of the Dekkhan and the Carnatic. But the population is comparatively sparse, and the harvests elsewhere in Bombay and Sindh and in the southern districts of Madras have been good. Both in Bombay and Madras trade is active, and no apprehension as to a failure of food-supplies has been expressed by either Government. The question has received special attention in the former province, and Mr. Muir-Mackenzie, the Director of Land Records, in a series of notes has carefully examined the case of each district in the light of the harvests of the years immediately preceding the present scarcity, and the returns of grain imports and exports. His conclusion is that in the two years immediately preceding the present scarcity the surplus unexported production of the Dekkhan and Carnatic districts represented eight months food-supply for the population of those districts. To this must be added the reserves which must have existed at the beginning of these two years of good harvests. On these figures a harvest yield in 1896–97 of only one-fifth of the average would sufficiently supplement the accumulated stocks to feed the population till the next crop is ready in the autumn of the present year. The returns of rail-borne traffic in the Bombay Presidency appear to support the view that considerable local stocks exist, and that the imports which arrive from Guzerat and Sind are for storage at certain centres rather than for immediate consumption. These imports are on a small scale compared with the imports into the same districts in 1877.

9. As to the food-supplies of Native States, it is not possible to speak with precision. But the populations of the affected areas are not dense, and outside the affected areas prospects are good.

10. Burma this year has an exceptionally large rice crop, the surplus available for export being estimated at 1½ million tons. Our information is that the European demand for Burma rice is not excessive, and that 600,000 tons of the surplus crop still remain in Burma. Up to date nearly 300,000 tons have been imported into India. During April the imports have fallen off, and it may be conjectured that for the present the up-country traders, especially in places

where the cold weather crops are now coming into market, find themselves sufficiently stocked with the staple, or are looking for a fall in prices in Burma.

11. Apart from the above data, more or less specific in character, we attach importance to the general attitude of the trade, and to the stationary character of prices where they are not actually falling. The markets are not excited, nor are there any indications of attempts on the part of traders to buy up food-grains extensively for storage, or of unwillingness to sell. Among the cultivating class grain is to some extent being held up in view of a possible continuance of scarcity, and to this is partly attributed the slowness of prices to yield in those parts of the country where the cold weather harvest has been good. But the trade anticipates that they must come down, and in Northern India sales of wheat and barley for forward delivery are being made at rates lower than those at present prevailing. In North Behar, where fears of the failure of food-supplies were expressed some time ago, the markets are now reported to be sufficiently supplied. The trade may be right or wrong in the view it takes that between now and the setting in of the monsoon rains prices will tend downwards and not upwards, and that stocks will meet all requirements till the autumn crops mature in the usual course. But our belief is that the trade is well informed and that it correctly interprets the situation.

It must not be overlooked that export of food-grains from India to foreign countries has for months past virtually ceased, and that great economy is being everywhere exercised under the pressure of high prices by nine-tenths of the population.

12. Thus we are, to use Your Lordship's words, "satisfied that the food-stocks in India are both sufficient for any probable emergencies, and capable of timely distribution." There is indeed an emergency which, though we have every reason to believe it improbable, is not beyond the range of possibility ; and that is the failure of the next monsoon rains, and therefore of the autumn harvest, over a considerable portion of the country. We are not able to speak with confidence as to the sufficiency of the general food-stocks were this emergency to arise. In such an event, the very diffusion of surplus supply and equalisation of prices to which we have already alluded, and which, so long as the sum total of food is sufficient, relieve us of anxiety as to its local distribution, might constitute a real danger ; for instead of prices rising suddenly and alarmingly in those places where the local supply was first exhausted, and thus constituting a danger signal which could not escape notice, the local deficiency would be temporarily made up from the already scanty stocks of other parts of India, and the eventual failure of supplies would tend to be more or less general and simultaneous over the whole face of the country. If again, the nature of the season declared itself from the first, and prices at once rose to a point at which importation became profitable, and therefore active, two clear months would be available before the time at which the autumn crops would ordinarily be reaped, and up to which their failure could not affect the stocks of the country. If, however, as in 1896, the failure occurred at the end, instead of at the beginning of the monsoon, the time available for importation would be seriously curtailed. Even in that event, however, a four anna crop over the whole country (which is a much lower average than that of last year) would add to what remained from present stocks a supply equivalent to perhaps two months' consumption ; so that it seems hardly possible that, even in the worst event, failure of supplies should come upon us so suddenly that foreign supplies could not be brought into the country in the ordinary course of trade.

13. We have considered the expediency of so far departing from our attitude of absolute non-interference with the grain-trade as to import our own supplies for the population collected on the relief works, or at least to hold a reserve of grain sufficient in the event of a sudden collapse of private trade to feed the population on relief for two or three months. The relief workers and other persons receiving gratuitous aid in India now number more than 3 millions, and in the most distressed districts the proportion borne by the persons relieved by the State to the total population exceeds 10 per cent., and in exceptional cases rises to 30 per cent. In these districts the local food-stocks are smallest, and it has been urged that the Government by its relief system has intensified the scarcity and has

raised prices against that portion of the population which has not come on to the works, and that therefore it ought to undo this evil by itself importing grain from a distance and supplying the relief camps. It has also been urged that the success of the present relief system is entirely dependent on food being everywhere purchaseable by the persons relieved, that the system would cease to work if the monsoon again failed and dealers refused to sell, and that as an obvious precaution the Government should hold in reserve sufficient grain to feed the relief workers for two or three months. Our reply to the first suggestion is that, as a matter of fact, the food-supplies for relief camps are already being drawn from a distance by the energy and resource of private trade. We have mentioned above that during the last four months the imports of rice from Burma into the North-Western Provinces and Oudh have been more than sufficient to feed the entire army of relief workers in the provinces, and there is no doubt that these imports have been undertaken by private traders in direct connection with the relief camps, in reliance upon the certain market which they find there. We could not have done more than the trade has done to relieve the strain upon local stocks, and we should have done it much less effectively and much more expensively than the trade, and we should have imposed a most serious additional burden on our already overworked officers. As to the second and alternative suggestion our preliminary objection is on the score of expense. We are asked to increase our famine expenditure by possibly two crores of rupees as an insurance against an improbable contingency, with the knowledge that if the contingency does not arise we shall, by having bought in a dear and by being obliged to sell in a cheap market, lose half the money we have expended. This is a weighty, though by no means an insuperable, objection. But the real objection, in our judgment, is that any action on our part of this kind would do more harm than good, by making the trade distrustful, by introducing an unknown element into its calculations, and by creating an artificially low level of prices. However clearly we defined our intentions, the trade would be always apprehensive that the Government reserves would be poured on to the market, or that the Government would step by step be driven to extend its operations. We need not discuss the point at length as we find a close parallel in the circumstances which led the Government of India in 1877 to prohibit the Government of Madras from laying in reserves of grain during the famine of Southern India. We concur in the arguments contained in Lord Lytton's Despatch No. 36, dated 22nd September 1877, to the Secretary of State for India, in which the question at issue between the two Governments and the reasons which led the Government of India to condemn the policy of holding a reserve of grain are fully discussed.

14. In short, we are strongly and deliberately of opinion that, even in the worst conceivable emergency, so long as trade is free to follow its normal course, we should do far more harm than good by attempting to interfere. The task of supplying a deficiency in the general food-stocks of India is one which would tax severely the utmost resources of mercantile enterprise, and any amount of grain that we might be able to purchase (and, what is far more difficult, to find storage for) as direct importers, would be but an insignificant fraction of the whole requirements; while we believe that, owing to the uncertainty and apprehension which our action would inspire and to the abnormal rise in prices which the appearance in foreign markets of a wealthy Government as a purchaser would probably create, we should, for every ton which we imported ourselves, prevent, or at least postpone, the importation of many tons by private merchants. So again, as soon as the trade is convinced that the course of prices will render import profitable, import will follow as a matter of course; and for us to grant a bounty on imported grain, or to guarantee a minimum price, would be to set our own opinion as to the sufficiency of stocks and the future of prices against the opinion of those who alone are in possession of reliable information on the subject. The former at any rate of these two courses is also open to the objection that it would amount to relieving the whole population of India at the public expense without the exaction of any test. This, however, is a mere question of economy, which it would be proper to set aside if men's lives were in the balance. But there is the further and more serious objection, that unless it was definitely understood that no such assistance or inducement would be forthcoming, the trade might postpone action in the hope of forcing the hands of Government. The

intervention in specific localities which, following the Famine Commission, we recognise may be necessitated by local circumstances, is justified only by the fact that the machinery of local trade is insufficient and that the task of superseding it is not beyond the resources of Government. Neither of these considerations is applicable to India as a whole; and we therefore submit, for Your Lordship's consideration, that so long as trade is free to follow it normal course, and so far as regards the general food-supply of the country as a whole, no circumstances could apparently arise under which our intervention would not be harmful rather than beneficial.

(Signed) ELGIN,
&c., &c.

Note.—The total area and total population of each district in which any relief operations are in progress are given in this statement, though in many cases distress is confined to a small area of the district.

The date at the head of the table is the date of the *Gazette of India* in which the Provincial totals were published. The figures however actually show the numbers on relief on the preceding Saturday. All previous returns should be read subject to a similar correction.

* Besides 8,757 on ordinary work.

* Owing to the fluctuation in the population for which returns are received in these districts it has not been found possible to estimate the present population, and consequently the rates have been calculated

† Average of five non-famine years. (*a*) Increase chiefly due to prevalence of cholera and smallpox. (*b*) Increased death-rate is due to cholera and smallpox.

Special death-rate return for districts in which distress exists or the existence of distress is apprehended—continued.

NOTE.—Mortuary registration has much improved in Bengal during the last five years, and an average rate struck on the figures for 10 years incorrectly represents the actual average mortality.

NOTE.—The average death-rate from April has been calculated for the last five years (1892-96).

Special death-rate return for districts in which distress exists or the existence of distress is apprehended—continued.

NOTE.—Excess mortality in January due to fever.

* These were two Bikanir immigrants. † In both these cases the deceased were immigrants, and in one want of food was only a contributory cause of death. Further inquiries are being made about the other. ‡ Figures incomplete.

(1) Statistics of deaths have only lately been collected, and the reporting is not accurate. The census figures of the population have been taken as correct, but one-quarter at least of the total population is believed to have left the district temporarily. There have been a few deaths from small-pox, especially among children. The death-rate is not, the Deputy Commissioner considers, more than normal, or, if so, slightly so.

(2) The number of deaths recorded in the month of February is 50 in the affected tract, and the population is estimated at 51,000. The death-rate would appear to be very low, but it is based on the reports of Circle Inspectors who were instructed to carefully and correctly collect statistics on this point.

(3) Accurate mortality return cannot be obtained, and a rough estimate is accordingly given. The death-rate in the opinion of the Deputy Commissioner is somewhat above normal owing to deaths from cholera and kindred diseases in several villages in the district.

(4) The death-rate of the month is abnormally high owing to the large mortality from cholera. There were 249 deaths from cholera reported during April, The disease is now abating.

Special death-rate return for districts in which distress exists or the existence of distress is apprehended—continued.

* NOTE.—In Famine Statement A for the month of April the starvation deaths in Raipur, Bilaspur, and Sambalpur in April are now returned as 71, 189, and 4 respectively.

† With the exception of one or two isolated cases among immigrants during the past month or so, there have been no deaths due to starvation in the Hyderabad Assigned Districts. The Commissioner writes :—I do not think that we have had deaths from starvation in the Hyderabad Assigned Districts. The exceptionally good death-rate is probably due to absence of malarial fever owing to early cessation of the

(*a*) No record is kept of deaths, &c., in the Melghattalug, where the distress is prevailing.
(*b*) The District Superintendent of Police has reported 14 deaths from starvation.
(*c*) Both the deaths were of outsiders unknown in the district, one an up-country man and the other from Khandesh. Even their names were unknown.
(1) The high death rate is due to a large number of deaths from cholera.
(2) Of these 5 persons 4 were wanderers and 1 a Mahar.
(3) No particulars received from the Deputy Commissioner.
(4) This was a woman who was a resident of Gahuli in Pasad Taluka.

Despatch from the Secretary of State to the Government of India—No. 229, Revenue—dated 23rd December 1897, with enclosure 8

CORRESPONDENCE

REGARDING THE

APPOINTMENT OF A FAMINE COMMISSION.

Telegram from the Viceroy, dated 22nd November 1897.

In Despatch by next mail we propose appointment of small Commission, on precedent of 1878, to formulate results of experience gained in recent famine. We believe that relief operations generally have been conspicuously successful, but degree of success, especially as regards economy, has varied in various provinces. Broad principles of relief prescribed by Commission of 1878 have been adhered to, but detailed provisions of Famine Code have been departed from in not unimportant respects, and on different lines in different provinces. It is important to collate, for future guidance, results of different methods thus employed while facts are fresh. Scope of inquiry will be far narrower than in 1878. No reconsideration of general principles required; but details of relief scheme, upon which effective relief at minimum cost depends, need revision. We propose following heads of inquiry:—(1) Divergence in practice and departure from codes in various provinces; (2) varying degree of success in relieving distress and saving life at minimum cost; (3) most effective and economical method of working; (4) recommendations or opinions likely to prove useful in future famines. We would suggest retired Indian official of high position as President, and one member, perhaps medical, appointed by you in England, and an Indian Civilian, an engineer, and a native gentleman of high position selected by us in India. Inquiry will last at least for four months, and should begin by the middle of January at the latest, or earlier if it be desired by you, though if much earlier preliminary collection of information may be incomplete. Please telegraph approval and probable date of meeting.

Telegram from the Secretary of State to the Viceroy, dated 30th November 1897.

Your telegram of 22nd November. I agree to your proposals regarding Famine Commission, which will be appointed by Viceroy as in 1879. I concur that main principles of famine administration are already settled, and I approve the subjects of reference. I have selected Sir James Lyall as President, and Dr. Richardson as Medical Member. They can reach Calcutta about 7th January. Other members and secretary will be selected by you.

Letter No. 86 (Revenue) from the Government of India to the Right Hon. Lord George F. Hamilton, M.P., Her Majesty's Secretary of State for India, dated Simla, the 25th November 1897.

My Lord,

The famine which has afflicted India during the past year is now drawing to a close. The ample rainfall of the recent monsoon has given an abundant autumn harvest and has established conditions favourable to the spring crops throughout almost the whole of India, and relief operations have already terminated in Madras, Bengal, the North-Western Provinces and Oudh, the Punjab, Berar, Hyderabad and Rajputana, and are expected shortly to terminate in the other affected tracts.

16522—875—4/98 Wt 18690 D & S 6

2. We have already forwarded to your Lordship a preliminary narrative of the operations, and our complete review of them must await the receipt of the provincial reports. But the information already at our diposal warrants us in believing that, regarded with reference to their object, which was to prevent the loss of human life from starvation at the smallest expense to the tax-paying community, those operations have, on the whole, been conspicuously successful.

3. As was to be expected, however, the degree of success with which that object has been attained, and especially the measure of economy which has been secured in the administration of relief, has not been the same in all provinces. In operations of such magnitude mistakes were inevitable, though we believe that they were seldom, if ever, serious in their nature or extent, and that they were in all cases promptly detected and remedied. The organisation for the relief of distress which has been elaborated in each province under our supervision on the lines laid down by the Famine Commission of 1878, and embodied in the Provincial Famine Codes, has now, for the first time in most of the affected provinces, been practically tested on a large scale, and on the whole it has stood the trial well. But while the experience of the past year has suggested no alterations in the main lines which were prescribed as the basis for the administration of relief, it has been found necessary, in almost every province, to depart in some not unimportant respects from the detailed provisions of the local code, in order to meet the varied conditions of distress. And the direction which these departures have taken has varied from province to province.

4. The experience thus gained will be of incalculable value when we next are face to face with famine. But in order to render it available for future guidance, it is essential to collect and collate it while the facts are fresh, and to embody it in amended Famine Codes. We fully recognise that, while the broad lines upon which relief is to be administered may properly be prescribed for the whole of India, variations in detail will be necessary under the varying conditions to be found in the several provinces, and that each province must retain its individual code. But it is impossible but that almost every province should have something to learn from the experience of others, and we think that it will be advisable to take special measures to collate that experience. Especially we think that, where the cost of relief and the numbers relieved have been larger than elsewhere in proportion to the acuteness of the distress and the population affected by it, it will be advisable to enquire to what causes the excess was due, and whether an adherence to the lines followed in other provinces might not, on a future occasion, reduce the cost without diminishing the efficacy of the measures to be adopted. We have already informed your Lordship that we appointed Mr. Higham, our Deputy Secretary in the Public Works Department, to examine into and report upon the systems of tasks and wages adopted in the various provinces, and his reports, of which we have already forwarded copies for your Lordship's information, will constitute a most valuable contribution to the discussion which we propose. But he necessarily dealt with one branch only of the subject, and his recommendations are based upon an enquiry of a limited nature.

5. We propose, therefore, if your Lordship approves, to appoint a small Famine Commission, on the model of that which was appointed with such signal advantage in 1878, to deal with the subject as a whole, and to formulate the lessons which the famine experience of 1897 has to teach us. The scope of the enquiry will be infinitely narrower than in 1878. Twenty years ago no general famine policy had been enunciated by Government, the experience gained in Behar in 1873 and in Southern India in 1877, from what were virtually experiments in relief, was all that was available, and the Commission had to formulate a policy and to evolve general principles for guidance in the actual presence of famine. But this was, perhaps, the least important portion of their duties. They were also bidden to consider and advise upon measures of the widest possible nature, such as might "diminish the severity of famines, or place the people in a better condition for enduring them." The programme that was laid down by them under the head of "Measures of protection and prevention" has since then been actively prosecuted. The protective works of which they advised the construction have been for the most part completed. The mileage of open railway has been doubled,

and the area irrigated by Government works enormously increased. An Agricultural Department has been constituted in every province, the village agency has been reformed, the record of vital and agricultural statistics has in most provinces been placed upon a satisfactory footing, the policy of agricultural loans by the State has been revised and extended, the assessment and collection of the Land Revenue is far more elastic than formerly, liberal conditions for the settlement of waste lands have been laid down, the organization of forest conservancy has made steady progress, and the relations between landlord and tenant have been regulated by legislation almost throughout those portions of India in which they are of importance. Meanwhile the industrial and commercial advance of the country has been rapid. Much, no doubt, still remains and always will remain to be done, but the omissions and defects are fully recognised; they are gradually being dealt with as opportunity offers, and we think that no further general enquiry of this nature is either necessary or advisable. So, too, the experience of the past year has shown us that the general lines of policy laid down in 1878 stand in no need of reconsideration. It is the details of the scheme of relief that require to be revised. But in such a matter details are hardly less important than principles.

6. We would suggest then that the Commission should be directed—

Firstly, to examine the manner in which the prescriptions of the Famine Codes have been departed from in the several provinces;

Secondly, to inquire into the degree of success which has in each case attended the measures adopted, considered primarily with regard to the relief of distress and the saving of human life, and secondarily with regard to economy;

Thirdly, to advise as to the measures and methods of working which seem likely to prove most effective in these two respects;

Fourthly, to record any recommendations or opinions which it is thought will prove useful in the case of future famines.

7. We think that the President should be, if possible, an Indian official of high position who has retired from Government service, and who would be selected by your Lordship. It would be well that the Commission should include another independent opinion; and a medical man, to be chosen in England by your Lordship, might perhaps be appointed. We would propose to complete the number by selecting in India a senior member of the Indian Civil Service, an Engineer of standing, and a Native gentleman of position. It may also be well to ask each Local Government, while the Commission is actually making inquiries within the province, to attach to it as a temporary member one of its own officers who is acquainted with the system of relief adopted, and whose presence will ensure that material points are not overlooked or misunderstood. A Secretary will be required; and if your Lordship approves our proposals, we shall place him on special duty at once, in order to collect detailed information from the various Local Governments, and to put it into shape for the use of the Commission.

8. The Commission will probably wish to visit Bombay, Madras, Bengal, the Central Provinces, and the North-Western Provinces and Oudh, and possibly Berar; and to make inquiries on the spot. The Punjab and Burma may perhaps be passed over. This tour will probably occupy something like six weeks. But before undertaking it they will require some weeks to consider the information already on record, and to decide upon their line of procedure; while after they have completed it, they will need at least a month in which to formulate their conclusions. On the whole we do not think that the work can be done in a shorter period than four months. March is the latest month in which travelling in India is not unpleasant; while it would be convenient if the Commission were to conduct their final deliberations at Simla after the Government has moved there at the end of that month, by which time, moreover, it may be hoped that the Provincial reports upon the recent famine will be available. Thus the Commission should assemble in India not later than the middle of January; while if any earlier date commends itself to your Lordship, and will suit the members from England,

arrangements can easily be made in India. But if the date fixed is much earlier, the information which we propose to collect from Local Governments may not be complete.

9. We are informing your Lordship by telegram of the general nature of our proposals, and asking for a reply by the same channel.

We have, &c.,

Extract from the Proceedings of the Government of India, in the Department of Revenue and Agriculture,—No. 35—245–26 *(Famine), dated the* 23*rd December* 1897.

READ—

(1) Despatch to Her Majesty's Secretary of State, No. 86, dated 25th November 1897.
(2) Telegram from Her Majesty's Secretary of State, dated 30th Noveember 1897.

RESOLUTION.

It has been decided, with the approval of Her Majesty's Secretary of State, to appoint a small Commission to formulate for future guidance the lessons which the famine experience of 1897 has to teach. The Governor General in Council will take another opportunity of publicly expressing his appreciation of the manner in which the operations for the relief of distress have been conducted; while any complete review of them must await the receipt of the Provincial reports. But the information already at his disposal warrants him in believing that, regarded with reference to their object, which was to prevent the loss of human life from starvation at the smallest expense to the tax-paying community, those operations have on the whole been conspicuously successful.

2. As was to be expected, however, the methods by which that object has been attained, and the measure of economy which has been secured in the administration of relief, have not been the same in all provinces. The organisation for the relief of distress which has been elaborated in each province on the lines laid down by the Famine Commission of 1878, and embodied in the Provincial Famine Codes, has now, for the first time in most of the affected provinces, been practically tested on a large scale; and on the whole it has stood the trial well. But while the experience of the past year has suggested no alterations in the main lines which were prescribed as the basis for the administration of relief, it has been found necessary, in almost every province, to depart in some not unimportant respects from the detailed provisions of the local Code in order to meet the differing conditions of distress. And the direction which these departures have taken has varied from province to province.

3. The experience thus gained will be of incalculable value when India is next face to face with famine. But in order to render it available for future guidance, it is essential to collect and collate it while the facts are fresh, and to embody it in amended Famine Codes. It is no doubt the case that, while the broad lines upon which relief is to be administered may properly be prescribed for the whole of India, variations in detail will be necessary under the varying conditions to be found in the several provinces, and that each province must retain its individual Code. But it is certain that almost every province will have something to learn from the experience of others, and it will be advisable to take special measures to collate that experience; and especially, where the cost of relief and the numbers relieved have been larger than elsewhere in proportion to the acuteness of the distress and the population affected

by it, to enquire to what causes the excess was due, and whether an adherence to the lines followed in other provinces might not, on a future occasion, reduce the cost without diminishing the efficacy of the measures to be adopted.

4. The inquiry will be far narrower in scope than that entrusted to the larger Famine Commission, which was appointed with such signal advantage in 1878. Twenty years ago no general famine policy had been enunciated by Government, the experience gained in Behar in 1873 and in Southern India in 1877 from what were virtually experiments in relief, was all that was available, and the Commission had to formulate a policy and to evolve general principles for guidance in the actual presence of famine. But this was, perhaps, the least important portion of their duties. They were also bidden to consider and advise upon measures of the widest possible nature, such as might "diminish the severity of famines, or place the people in a better condition for enduring them." The programme that was laid down by them accordingly under the head of "Measures of protection and prevention" has since then been actively prosecuted; and though much still remains and always will remain to be done, the omissions and defects are fully recognised, and are gradually being dealt with as opportunity offers, and no further general enquiry of this nature is either necessary or advisable. So, too, the experience of the past year has shown that the general lines of policy laid down in 1878 stand in no need of reconsideration. It is the details of the scheme of relief that require to be revised. But in such a matter details are hardly less important than principles.

5. The duties of the Commission will therefore be—

- to examine the manner in which the provisions of the Famine Codes of the several provinces differ from one another, and in which their prescriptions have been departed from;
- to inquire into the degree of success which has in each case attended the measures adopted, considered primarily with regard to the relief of distress and the saving of human life, and secondarily with regard to economy;
- to advise as to the measures and methods of working which seem likely to prove most effective in these two respects; and
- to make any inquiries and record any recommendations or opinions which it is thought will prove useful in the case of future famines.

It is to be understood that the object of the inquiry is to furnish guidance for the future; and that it is concerned with the past, only in so far as may be necessary to that end.

6. The President of the Commission will be Sir James Broadwood Lyall, G.C.I.E., K.C.S.I., late Lieutenant-Governor of the Punjab. The Members of the Commission will be Surgeon-Colonel Richardson, lately Inspector General of Civil Hospitals, North-Western Provinces and Oudh; Mr. T. W. Holderness, C.S.I., lately Deputy Secretary to the Government of India in the Department of Revenue and Agriculture (Famine); Mr. T. Higham, C.I.E., Inspector General of Irrigation and Joint Secretary to the Government of India in the Public Works Department; and Rai Bahadur Bipin Krishna Bose, M.A., B.L., Government Advocate, Nagpur, and Secretary to the Provincial Committee of the Famine Charitable Relief Fund. Mr. H. J. McIntosh, I.C.S., will be Secretary to the Commission. The representation upon a small Commission of each province affected by the late famine is impossible; but the Government of India desire that each Local Government should nominate, to be attached to the Commission as a temporary Member while they are actually making inquiries within the province, one of its own officers who is personally acquainted with the practical working of the system of relief adopted, and whose presence will ensure that material points are not overlooked or misunderstood.

7. The Commission will be formally constituted on the arrival of Sir James Lyall and Dr. Richardson from England. They will probably wish to visit Bombay, Madras, Bengal, the Central Provinces, the North-Western Provinces

and Oudh, and possibly Berar, and to make inquiries upon the spot; but the Governor General in Council desires to leave the matter of method and procedure in the investigation with which they are charged entirely to their discretion. The general conduct of the inquiry and the regulation of the course of business before the Commission will be entrusted to the President in communication with the Members. The Commission, through their Secretary, acting under the instructions of the President, will correspond direct with Local Governments and Departments of the Government of India, and with any local authorities with whom direct communications may be authorised by Local Governments as a matter of convenience and in order to save time; and it is requested that all communications or requisitions for information emanating from them may be treated as urgent and complied with promptly, and that in the event of the Commisssion visiting a province, they may be afforded every facility for their inquiries.

ORDER.—Ordered, that copies of this Resolution be forwarded to the Local Governments noted in the margin, to the Secretary to the Famine Commission, and to the Foreign, Public Works, Home, and Finance Departments of the Government of India for information.

Govt. of Madras,	Ch. Commr. of C. P.

Ordered also, that it be published in the Supplement to the *Gazette of India* for general information.

By order,
DENZIL IBBETSON,
Secretary to the Government of India.

Revenue, No. 229.

To His Excellency the Right Honourable the Governor-General of India in Council.

MY LORD, India Office, London, 23rd December 1897.

I HAVE considered your Excellency's Letter, No. 86 (Famine), dated the 25th November 1897, confirming, and adding details regarding, your proposal that a small Famine Commission should be appointed to investigate the famine relief measures taken in the several provinces, to review the lessons to be learnt from the relief operations of 1897, and to record recommendations that will prove useful in future famines.

2. My telegram of the 30th November has informed you that I agree to your proposals regarding the Famine Commission, and that I fully accept your view that the main principles of famine administration, as laid down by the Famine Commission and embodied in the provincial Famine Codes, are settled and need not be reopened. At the same time, I am confident that valuable results will be gained by collating and reviewing the experience of relief administration in the several provinces. I attach much importance to the second head of the inquiries to which you have drawn the attention of the Commission; and I am glad to observe that, under the fourth head, you have encouraged the Commission to make such general or special recommendations as they may see fit on the subject of famine relief administration.

3. I enclose copy of the letter, dated 30th November 1897, in which Sir James Lyall and Surgeon-Colonel Richardson were informed that, in accordance with your request, I had selected them to be President and Member of the Famine Commission which you proposed to appoint.

I have, &c.,
(Signed) GEORGE HAMILTON.

ENCLOSURE.

SIR, India Office, 30th November 1897.

I AM directed by the Secretary of State for India to forward copy of a telegram,* showing that the Government of India have decided to appoint a small Commission to investigate certain matters connected with the recent famine in India, and have asked the Secretary of State to select from retired Indian Officers a President and a Medical Member for the Commission. Lord George Hamilton has been glad to learn that you are willing to serve as $\frac{\text{President}}{\text{Medical Officer}}$ on the Commission, and has informed the Viceroy accordingly.

* Telegram from the Viceroy of India, of 22nd November 1897.

It is proposed that you should leave Brindisi by the S.S. "Ballarat" on the 19th December, reaching Calcutta about the 7th January. Return tickets by steamer and reserve accommodation in the Peninsular and Oriental special train to Brindisi will be secured for you. All your travelling expenses in India will be defrayed by the Government, and the Secretary of State in Council has sanctioned a daily allowance of three guineas a day for the period of your stay in India on duty.

I am, &c.,

Sir James Lyall, G.C.I.E., K.C.S.I.
Surgeon-Colonel Richardson.

(Signed) A. GODLEY.

NARRATIVE AND RESULTS OF THE MEASURES ADOPTED FOR THE RELIEF OF FAMINE DURING THE YEARS 1896 AND 1897.

No. 2469.

Extract from the Proceedings of the Government of the North-Western Provinces and Oudh in the Scarcity Department,—under date Allahabad, November 23rd, 1897.

READ again—

Resolution No. 3545S., recorded by the Lieutenant-Governor and Chief Commissioner on the 20th October 1896, reviewing the relief operations in Bundelkhand and in certain other districts of the North-Western Provinces and Oudh during the spring, summer, and autumn of 1896.

Letter No. $\frac{196}{S-73}$, dated 23rd November 1896, reporting on the extent to which the early cessation of the rains of 1896 had injured the *kharif* harvest, prejudiced the prospects of the ensuing *rabi*, and affected the condition of the people at large.

Correspondence and Minutes of conferences between the Lieutenant-Governor and Chief Commissioner and Commissioners of Divisions, the Chief Engineer, District Officers, Superintending Engineer and others regarding the organization and conduct of relief measures from October 1896.

Read also—

Communications under various dates from Commissioners of Divisions, Collectors of Districts, and Superintending Engineers in whose jurisdictions famine or scarcity prevailed during 1897, reporting on the organization, progress, termination, and results of relief operations carried out under their supervision and control.

RESOLUTION.

INTRODUCTION.—This narrative deals with the famine which visited the North-Western Provinces and Oudh during the years 1896 and 1897. These Provinces cover an area of 107,500 square miles, and in 1891 contained a population of 46,905,085, or nearly 47 millions. It is believed that the population has since increased. At one period or other

during 1896 and 1897 every part of this great territory was to a greater or less extent affected by crop failure, entailing scarcity of food or high prices. In one-third of the area there was famine; in another third there was scarcity; and in the remainder there was the pressure which famine prices cause. Previous famines or scarcities—and there have been many—affected only limited portions of the Provinces. This is the first occasion within historic memory that the entire country has been so severely afflicted.

The local famine in Bundelkhand last year declared itself on the failure there of the *rabi* or spring harvest: the general famine of the present year immediately followed on the failure of last year's autumn or *kharíf* crops. But neither famine was produced by the loss of a single harvest: the causes which culminated in these visitations must be sought much further back than the local or general crop failures of 1896.

The year 1896 was only the last and worst of a series of years marked by adverse conditions of climate, and by the deficient harvests which such conditions produce. To explain the events which, beginning in 1896, reached a climax in 1897, it is necessary to review, as briefly as may be, the character of the preceding years and to narrate the repeated disasters which befell those extensive regions in which famine or scarcity subsequently developed.

CHAPTER I.

Economic condition of the North-Western Provinces and Oudh from 1892 *to* 1896.

SINCE the last scarcity of 1877-78 the welfare of the United Provinces had up to 1892 met with no serious check. There had been, it is true, deterioration, within limited areas depression and even local distress. But these troubles were no more than the fluctuations of agricultural prosperity that might be expected in any large tract of country; and the period of fifteen years that followed the famine of 1877-78 was a period of progressive welfare throughout the United Provinces generally.

In 1892 the country was at a stage of full normal prosperity. Prices were moderate and bad harvests in Europe gave an extraordinary stimulus to the Indian export trade. From April 1891 to June 1892 the rush of wheat to the seaports had been in excess of anything formerly known: and it is calculated that during 1892 the Provinces exported surplus grain to the value of nearly four crores of rupees. An alarm was raised that the money thus brought into the country was the price of a dangerous exhaustion of the local food supply; but this was disproved by a special inquiry which Government instituted into the state of the existing stocks, and the alarm was further dissipated by the trade reaction in the following year. 1892.

The harvests that bore the brunt of all this export were distinctly good. The spring crops gave an outturn which was for the most part normal and nowhere, except in the Azamgarh district and in the Kumaun division, under 75 per cent. of a full average. Favoured by a timely and well-distributed monsoon rainfall, the autumn crops were sown over an exceptionally large area, and their produce was as good as that of the foregoing spring harvest, except in parts of Bundelkhand and in the rice lands of the Benares and Gorakhpur divisions. These latter tracts suffered from droughts and floods, and the consequent failure in the rice crop, on which these divisions largely depend, had to be met by considerable imports of that grain from Bengal.

The winter of 1892-93 was an unusually wet one, and was followed by years of excessive rainfall, which have had no small part in leading up to the recent distress. The spring harvest of 1893, though giving fully an 80 per cent. outturn for the Provinces as a whole, was by no means of uniform excellence. Magnificent crops were produced on unirrigated and light soils; but the wet and cloudy weather that prevailed up to harvest time induced rust and blight in lowlying lands 1893.

and on the heavy black soil of Bundelkhand. The ripening crops, too, in many places were devastated by storms of hail that swept over the country in March, and necessitated revenue remissions in 12 districts, amounting to close on 2½ lakhs of rupees. The southern and western districts of the Provinces showed excellent harvests; but Azamgarh and three-fourths of Bundelkhand suffered severely from the combined effects of hail and excessive moisture.

The monsoon rains began early and continued abnormally heavy. The autumn harvest was generally impaired by the constant wet, which culminated in a cyclonic storm in October. Except for rice, which turned out unusually well, the yield on the whole was not quite 70 per cent. of the average. It was best in the Meerut, Rohilkhand and Agra divisions, and worst in Oudh and in the Bánda, Allahabad, Gházipur, Ballia and Azamgarh districts of the North-Western Provinces.

This deficiency in the harvests produced its natural effect on the activity of the export trade, which indeed had begun to wane by the end of 1892. There was some surplus of export from Meerut and Rohilkhand; but the pinch of light harvests began to tell in the Allahabad and Benares divisions, which had to import respectively about 4,600 and 3,250 tons of food grain for their own consumption.

1894. The year 1894 opened with much promise. The copious rains of the preceding autumn had led to spring sowings which covered over a million acres more than in 1893. But the winter rains, besides being irregular in distribution, were interspersed with long intervals of cloudy weather, and were followed before harvest time by untimely high winds. Blight and rust accordingly followed; but still the crops looked good, and it was not till they came to the threshing floor that a distinct lightness of the grain in the ear became apparent. The yield of wheat was the poorest for ten years past, nowhere except in the Doáb exceeding two-thirds of a normal outturn. The coarser cereals did better, and sugarcane was very successful; but the harvest on the whole was again not above 70 per cent. of an average outturn, and it was particularly disappointing in the eastern divisions. In Bundelkhand the wheat and linseed crops were most seriously damaged by rust, and in the Jhánsi and Jalaun districts further havoc was wrought by hailstorms.

To an indifferent spring outturn succeeded a still more unfortunate autumn harvest. Exceptionally heavy rains again characterised the season; and over large areas the autumn sowings were washed out of the ground. In October and early November came fresh storms of rain, followed by disastrous floods along the courses of all the larger rivers by which many houses were wrecked and much property destroyed, necessitating large remissions of revenue. In the tracts visited by inundations the millets and autumn

pulses were almost entirely destroyed and the rice crop was seriously damaged except on high ground, where it is scantily sown.* This only mitigated the loss. For the provinces as a whole the estimated outturn was barely above half of a normal average. In the districts of the Lucknow and Benares divisions and in Bánda, Basti and Azamgarh it was considerably less. The inclemency of the season started severe epidemics of cattle disease, which decimated the agricultural stock. Nor was the autumn more favourable for men than for cattle: malaria and cholera raged nearly all over the Provinces, and in the district of Gorakhpur alone the latter disease claimed close on 20,000 victims.

To what extent of distress the short harvests of the year and the weakening of the agricultural resources would have led if help from external markets had not been available, it is difficult to say. But the money that had poured into the country during the preceding export seasons now saved the position from being critical, and the Provinces were able to spend about 1⅛ crores of rupees in supplementing their food stocks from outside. Both 1893 and 1894 had been years of plenty in the Panjáb, and from its teeming granaries came an influx of grain that penetrated into the most distant parts of these Provinces. Between April 1894 and March 1895 the Panjáb imports by rail alone were well over half a million of tons, exclusive of large supplies that must have crossed the border by road. And now it was that the unequal fortunes of the different parts of the Provinces first began to come out in high relief. During the busy season of 1894-95 the Gangetic Doáb was not only able to act as a clearing house for the drafts on the Panjáb, but to send out a substantial surplus of its own, the net exports from Meerut and Agra being about 111,000 and 60,000 tons respectively. Rohilkhand held its own and somewhat more, paying for the grain it imported by large consignments of home-grown sugar. But in all the other divisions the imports far exceeded the exports.

Such then was the position in the beginning of 1895. The harvests generally had been deficient, markedly so in the eastern districts, in Bundelkhand, and in the valley tracts along the main rivers. Disease had been rife and prices were rising briskly, stemmed only by the influx of grain from the Panjáb. Of the nine divisions in the Provinces only four were supporting themselves, and only two of these were helping their neighbours: the other five, with a population of 30¼ millions, had become partly dependent on food supplies from outside.

Thus when 1895 began the prospects for the future were only moderately bright. The winter had once more been a wet and cloudy one, and the harvest month of March was visited by more than usually damaging hail and duststorms. The extraordinary excess of the autumn rainfall of 1894 1895

is graphically shewn in the accompanying diagrams. In many places it had been impossible in the driving rain to plough the fields in time for the spring harvest; the sowings had been late; and in extensive tracts they had failed and had had to be repeated. The area actually sown, however, was up to the normal; and in the early spring the crops looked full and promising. But as they were ripening, clouds brought rust and blight, or high winds shrivelled the grain and reduced the produce. In Meerut and Agra alone was the outturn satisfactory; in these divisions the people (who had saved very largely in canal dues as irrigation was superfluous) reaped a harvest which was over 80 per cent. of the normal. In Rohilkhand the result was fairly good, except in the Sháhjahánpur district, where it fell short of half the average: elsewhere it was much below average, especially in Oudh and in Bundelkhand, where the important linseed crop was barely 25 per cent. of the average: while the wheat was little better. In all the five eastern and southern divisions the crops gave little more than half an average yield.

During the summer of 1895 there could thus be little doubt that in many parts of the country the poorer classes were not far removed from distress. In the Rae Bareli, Sitapur and Hardoi districts of Oudh test relief works were opened, and in the two latter districts large remissions and suspensions of revenue were made. Nearly two lakhs of revenue were remitted on account of crop failures in Bundelkhand; while Jalaun and Hamírpur received considerable reductions in their deteriorated tracts. Partly through these concessions and partly by virtue of continued grain imports from the Panjáb and the Gangetic Doáb, acute distress was staved off. A plentiful mango season, too, eked out the food stock of the poorer classes, and prices remained wonderfully steady, though with a natural tendency to rise.

The monsoon rains of 1895, anxiously awaited, began in due time with heavy and sudden falls, but afterwards lightened off considerably. A fairly normal area was shown as cultivated, and up to the beginning of September there was every hope of a good harvest. But, save for some scattered showers, the rains virtually ceased on the 5th of September and the drought thereafter reduced the harvest by about 20 per cent. short of the average. In the greater part of the Provinces the harvest was not bad enough to be the cause of anxiety had it followed a series of normal seasons and found the people prepared for hard times. But the cumulative results of indifferent harvests and climatic troubles were beginning to tell severely in Bundelkhand and in most of the eastern districts. In Bundelkhand, where nature is rarely propitious, the *káns* weed, stimulated in its growth by the previous heavy rainfall, was spreading and weakening the failing resources of the cultivator: in the autumn of 1895 the area under the plough had contracted by

nearly one-seventh, and the staples of the tract—the great millet, cotton and sesame—were largely ousted by poorer and coarser crops. In the eastern divisions, where the population is densest and the struggle for life most acute, the ravages of the floods of 1894 had been followed by the loss over large areas of the 1895 rice crop, the mainstay of the local agriculture. In Oudh and in the two eastern districts of Rohilkhand the depletion of food stocks was assuming a scarcely less serious phase. The year, too, was again an unhealthy one, the great heat that followed the premature close of the rains sowing the seeds of cholera and malaria. Among cattle the mortality from rinderpest was excessive, and an epidemic of foot-and-mouth disease followed the use of fodder injured by the untimely drought.

To add to their misfortunes the Provinces were now deprived of the help hitherto freely given by the Panjáb. The exuberant harvests of that Province had ceased in 1895, and its exports markedly declined in the latter half of the year. From April 1895 to March 1896 the rail-borne traffic in grain from the Panjáb was only 222,000 tons as against 500,000 in the preceding 12 months. The canal-irrigated divisions of Meerut and Agra as usual continued to show a balance of export in their favour; but the admitted surplus of the other seven divisions dwindled to insignificant figures, while their net food imports aggregated over 337,000 tons, and they would no doubt have taken more had the outside market been easier.

As a natural consequence of the tightening of stocks prices at last began to rise, and with no uncertain movement. By the beginning of 1896 the staple food grains were in the majority of districts 25 per cent. dearer than the normal, and prices rose sharply up to the end of February. The spring crop was then within sight of harvest, but its prospects were far from promising. The drought of the preceding autumn had reduced the area practicable for sowing. In many districts the dry baked ground defied the plough; and where irrigation was impossible the cultivator hesitated to risk his seed. For seed was scarce and very dear; and the chances of its germination in unirrigated soil grew fainter as the year wore on and rain held off. The area actually sown was fully an eighth below the normal. In Bundelkhand alone it shrunk by over a quarter of a million acres; and the total defect for the Provinces was over two million acres. 1896.

With the exception of some showers in the beginning of December, there had been no rain between the early close of the monsoon on 5th September 1895 and the end of January 1896; but these showers had been of no material value in Bundelkhand, nor were they anywhere sufficient for the growing crops after such a prolonged drought. In the end

of January there was some irregular and badly distributed rain, ample enough to be valuable only in the Muttra district and in the Meerut and Rohilkhand divisions: elsewhere the fall was trifling, and it altogether passed by the Benares division and Bundelkhand, where it was most sadly needed. Hot winds, too, began to blow before the end of February, prematurely ripening the crops. Irrigation had gone far to relieve the strain in tracts where water was available. The canals were efficiently protecting the irrigable area in Meerut and Agra, and small temporary wells were being dug in exceptional numbers throughout Rohilkhand and the submontane tracts where the water-level is high. But for the Provinces as a whole little more than a third of the cropped area had access to an effective supply of irrigation, and in Bundelkhand, where the season was driest, the irrigable area was insignificant.

The harvest began early. The irrigated crops were up to the average or very little below it. Sugarcane, gram, peas and the *arhar* pulse gave a satisfactory yield; wheat did well wherever it had got water; and the harvest of food grains as a whole was probably not under 65 per cent. of a normal harvest. But this left a very large deficiency. Had the defect been equally spread over all the tracts in the Provinces, the storm might have been weathered: the third part of a harvest had been lost before, without reducing the general population to dangerous straits. But the disparity of fortune between the different parts of the country, originating in the troubles of the preceding years, had become now more accentuated than ever. To them that had, to the prosperous and protected districts of the Upper Doáb, was given: from them that had not, from the waterless expanses in Bundelkhand, from the submontane tracts, and from the far east, was taken much of what they might have had. In the Allahabad division the harvest was 55 per cent. of the normal, and individual districts ran through the gamut of affliction down to 47 per cent. in Jalaun and 38 per cent. in Bánda. As the poverty of the threshing floors became apparent prices rapidly stiffened, and by the end of April they were approaching rates which had hitherto been unknown except in years of famine. Imports from the Panjáb virtually ceased; the cultivators, fearful of even harder times than the present, shut up their grain and refused to sell; and a slow and painful dribble from the Doáb to the eastern districts and Bundelkhand was now the only appreciable movement in trade. The period of famine had begun.

CHAPTER II.

The Bundelkhand Famine of 1896.

In the preceding chapter it has been shown that the unfavourable conditions which assumed the unmistakeable shape of famine in 1896 had their origin as far back as 1893. The region which had suffered most persistently was the region where distress was first to develop, namely the four districts—Bánda, Hamírpur, Jalaun and Jhánsi—known as British Bundelkhand. The southern part of the Allahabad district lying beyond the Jumna adjoins this tract and resembles it in physical conformation; it shared its misfortune. Bundelkhand, it has been shown, had suffered from agricultural depression for the previous three years. With the exception of the comparatively small area commanded by the Betwa Canal it is unprotected by irrigation. In point both of the fertility of its soil and of the industry and agricultural skill of its population it compares unfavourably with the rest of the Provinces. Since the autumn of 1893 the outturn of the autumn crops there had been uniformly poor, while that of the principal spring crop (wheat mixed with either gram or barley) had been worse. The abnormal succession of bad seasons had also encouraged the growth in the culturable area of the coarse grass known as *káns*. The result of this prolonged period of adversity was a decrease in 1895 of 192,672 acres, or 13·5 per cent. in the normal autumn crop area, and this was followed by a still more serious decrease in 1896 of 292,362 acres, or 19 per cent. in the normal spring crop area. The monsoon of 1895 ceased early in September, and the winter rains entirely failed. The stock of grain in the villages, reduced by double sowings, became low; prices began to rise before the end of the year, and the impoverished landowning classes were unable to assist their tenants. By the beginning of 1896, when the Lieutenant-Governor visited Bundelkhand, it was manifest that the region was on the brink of famine.

The affected area was fortunately well served by railways (the result of a wise employment of the Famine Insurance Fund), and it was from the first apparent that private trade would be capable of supplying all the food required, and that no heavier burden would fall on Government than attaches to the provision of relief works and of those other measures of charitable or gratuitous assistance which are described in the Famine Code. In the first week in February, when the failure in the spring harvest had been placed beyond doubt, and when the first signs of commencing want had become apparent, test works were started in the

form of improvements and repairs to roads in all the districts of Bundelkhand and in South Allahabad. At the same time preparatory steps were taken to deal with more severe distress when it should show itself. The executive staff of the various districts was strengthened; relief circles were formed, and officers to take charge of them were nominated; sites were selected for poorhouses; the programme of relief works was revised and expanded; a staff of hospital assistants was deputed to supervise sanitary arrangements on relief works and administer medical comforts in temporary hospitals; provision was made for the relief at their homes of indigent persons enfeebled by age or disease or debarred by national custom from appearing in public; and the opening of the Government forest to pasturage and collection by the people of edible produce was arranged. The administrative framework necessary for the management of large relief operations was thus held in readiness at the beginning of the emergency, and all that was afterwards necessary was to fill it in as necessity required.

The number of applicants for employment on the test works opened soon became so considerable that, on the 28th February, these works were converted into regular relief works under the Famine Code. With a view to an useful subdivision of work and responsibility it was ordered that large operations, such as roads, should be managed by the Public Works Department, and that minor works, such as village tanks or reservoirs, and all poorhouse and village relief should be carried out by local agency controlled by the District Officers.

In Bundelkhand the population, which contains a considerable admixture of aborigines, depends a good deal for sustenance during the summer on the *mahua (Bassia latifolia)* crop and other edible forest products. But by April it became manifest that the *mahua* crop had failed, while the prices of the staple food grains rose steadily and the numbers on relief works increased. It had been estimated by the local officers in March that at the period of greatest pressure the numbers in receipt of relief would not exceed 140,000; but by the middle of April that number was exceeded and the numbers continued to rise, till in the third week of May they reached their maximum pitch of 263,961. The unprecedentedly low rate of wages paid, combined with the not unsubstantial outturn of work done, proves that the people were in real need of help.

In addition to the relief afforded by public works, by the establishment of poorhouses, and by the distribution of assistance to respectable but indigent people, much help was also given by granting advances of money, under the Agriculturists' Loans Act, and by suspensions and remissions of revenue. The actual sum distributed by way of recoverable

advances without interest was Rs. 1,85,118; and the actual amount of revenue suspended by the Commissioner was Rs. 2,16,000 on account of the autumn instalment of 1895 and Rs. 8,78,000 on account of the spring instalment of 1896. In this way substantial assistance was afforded to the landowning and cultivating classes, as the suspension or remission of revenue carries with it, under the North-Western Provinces Rent Act, the suspension or remission of double the amount in rent.

At the beginning of June the Government laid down the policy to be adopted after the breaking of the rains with the object of inducing the people to return to their ordinary avocations as soon as possible. Village works being carried out by Civil Officers were to be contracted to a minimum on the opening of the monsoon, and no further grants for such works were to be made, it being left to the Commissioner's discretion to continue the distribution of gratuitous relief in villages and at poorhouses when absolutely necessary. With regard to road works, orders were issued that all operations under the control of the Public Works Department should be reduced to a skeleton at the break of the rains in the districts of Jhánsi and Jalaun, where the distress was judged to be less acute; and that in Bánda and Hamírpur the extent of the works should be greatly contracted. The works remaining were to consist in stone-breaking and quarrying, which were considered suitable for the rainy season as they could be done under cover. Task work was to be strictly exacted, and only persons capable of earning a living on task work were to remain on the public works, debilitated persons being provided for in poorhouses. It was also laid down that, with a view to inducing people to revert to agricultural work, no wages should be paid to any person on relief work in excess of the minimum subsistence wage (or its money equivalent) prescribed by Article 108, Famine Code.

The combined effect of these measures, reinforced by the certainty of ordinary agricultural employment when the rains would set in, and also to some extent no doubt by the fear of cholera, was seen in a great decrease of relief workers. The numbers, which in the third week of May had exceeded 260,000, fell by the third week of June, when the rains had broken, to 52,619. By the middle of July all relief works under control of the Public Works Department had been closed except in Bánda, where a few quarry works were still open; and all village works had been closed except in Jhánsi, where some were still unfinished. The relief administered after that time consisted almost entirely of that given at poorhouses and of the gratuitous relief administered through the agency of village officials to respectable persons debarred by national custom from appearing in public. At the end of August the total number in receipt of any

form of relief in Bundelkhand had fallen to 5,904, and without doubt this number would have melted away, too, had not the threatenings of the far greater difficulties to come completely altered the situation.

In March prices throughout Bundelkhand, as elsewhere, were substantially above normal rates. The difference between wheat and the coarser grains was, however, well marked. During the summer wheat for a short period slightly relaxed in price, but the other staples rose steadily in value. By the end of August wheat had risen to the rate prevailing in March, and there was a significant approximation to it in the price of the coarse grains.

The following statement compares the average prices current in Bundelkhand for the food grains principally used during March, May and August 1896, with the normal prices during these months :—

Seers per Rupee.

Month.	Wheat.		Gram.		Arhar pulse.		Juár.	
	Normal.	1896.	Normal.	1896.	Normal.	1896.	Normal.	1896.
March ...	18·56	11·36	25·31	19·23	26·19	15·20	24·03	15·69
May ...	17·43	11·94	22·75	15·37	28·43	13·30	22·31	14·55
August ...	16·19	11·04	21·62	13·69	24·50	12·25	20·87	13·68

High as prices were, there can be no doubt that they would have been much higher but for the active importation of food grain which went on during the whole period of distress. The imports and exports of food grains at the railway stations situated in the Bundelkhand districts were carefully recorded. From January to July the total net imports amounted to about 27,500 tons. Besides this rail-borne traffic there was a considerable import by road from Cawnpore and other neighbouring centres across the Jumna. In this and the greater trouble which awaited it, Bundelkhand owes its safety to the facilities for transport of food supplies afforded by the Indian Midland Railway.

In the earlier months of the famine the death-rate rose little above normal. The health of relief workers remained on the whole very good all through. They were often, when first coming on the works, in an emaciated and reduced condition. But later on, when the distressed tracts were visited by the Inspector-General of Civil Hospitals and the Sanitary Commissioner, these officers found no appearance of starvation among the people on the works. Had there been, the relief operations would have failed of success.

Later in the spring influenza and small-pox swelled the mortality, and in the summer months cholera appeared in a very virulent form and claimed many victims. Towards

autumn fever of a peculiarly virulent type was prevalent, especially in the Hamírpur and Jhánsi districts, and added much to the mortality. It apparently had not its origin in famine, for it was observed to visit the rich and poor alike, and was not of the remittent type. Through the whole of this period few deaths, if indeed any, could be traced to actual starvation; but the following mortuary statistics, extracted from the Sanitary Commissioner's Report for 1896, may be taken as evidence that the pressure of hard times claimed many lives, mostly among the old and the very young.

Statement showing Death-rate per thousand, month by month, in Bundelkhand during the Famine of 1896, *with Average Death-rate for ten previous years.*

The same causes which affected Bundelkhand necessitated also some measures of relief in the Allahabad district, the Hardoi district of Oudh, the Pilibhít district of Rohilkhand, and the Garhwál and Almora districts of Kumaun. In the part of the Allahabad district bordering on Bundelkhand, and resembling it in climate, soil and population, the distress was for a time severe, and in Hardoi also there were signs of the serious trouble which followed; but fortunately in none of the other districts did the reality come up to the local officers' early apprehensions. The relief measures adopted in these districts do not call for any lengthened description. They were carried out by the District Officers without assistance from the Department of Public Works, and comprised repairs to unmetalled district roads, poorhouses and some gratuitous relief under Chapter X of the Famine Code. In all the districts except Hardoi the pressure practically ceased when the rains had regularly set in; but in Hardoi, during the latter portion of July, when there was a prolonged break in the rains, distress threatened to assume serious proportions.

During the operations in Bundelkhand described in the preceding paragraph, the expenditure incurred in relief

works controlled by the Public Works Department amounted to Rs. 7,15,088, classified as follows:—

	Rs.
Paid as wages for work done	5,37,608
Do. as gratuitous relief to dependants ...	43,758
Do. cost of temporary establishment, tools and plant	1,33,727
Total ...	7,15,088

The work done consisted of 345½ miles of road constructed or repaired, with wayside tanks re-excavated, and 47 large reservoirs constructed. The wages fell at the rate of Rs. 9·62 per 1,000 cubic feet.

The number of people relieved, expressed in units for one day, was 12,843,200, and the average daily cost per head, all charges above included, was 10⅔ pies.

In addition to the relief afforded by the Public Works Department, the District Officers expended Rs. 3,60,061 on village works, gratuitous village relief, and maintaining poor-houses. The work done is returned as follows:—

132½ miles of road remodelled.
559 village tanks } re-excavated.
225 village wells }
39 reservoir embankments constructed.

The cost of work per 1,000 cubic feet done is shown as Rs. 4-8; the explanation of the low rate of cost lying in the fact that the village proprietors, who benefited by the work, controlled the expenditure of the money and made it go as far as possible. But this had its disadvantages from a relief point of view, as probably none but able-bodied workmen were employed.

The total number of persons relieved by the expenditure for one day amounted to 5,533,391, and the cost of relief for each averaged one anna per head.

In the rest of the other districts of the North-Western Provinces and Oudh where relief operations were undertaken the number of persons relieved (in units for one day) reached to nearly one million, while the cost amounted to Rs. 1,05,004. The average cost per head was here higher than in Bundelkhand, reaching 1⅜ annas per day. The explanation lies in the heavier incidence of the cost of establishment computed with reference to the smaller numbers in relief.

Throughout the Provinces, therefore, the total number of persons relieved was about 19½ millions and the total expenditure was Rs. 11,80,153. The cost of relief was 11·6 pies, or something less than one penny sterling per head daily.

CHAPTER III.

Proximate cause and premonitory symptoms of the general Famine of 1897.

THE proximate cause of the famine of 1897 was the premature cessation of the monsoon rains of 1896. These rains began favourably. The normal date in these Provinces for their commencement is the 25th June. Some preliminary showers fell during the early part of that month; but taking one district with another, the true monsoon rains of 1896 opened on the 21st of the month.

In parts of the Gorakhpur, Agra, Bareilly, and Lucknow divisions and in the Bánda district the rainfall at the commencement was insufficient, but elsewhere there was enough. Bundelkhand in particular had good rain everywhere except in Bánda. At the end of June, therefore, prospects were on the whole favourable. Moderate but still sufficient rain was received early in July; but in the second week a break set in, which threatened the crops then full of promise. The danger was averted by a timely fall in the latter part of the month, and prospects became bright again except in some tracts of Oudh and Gorakhpur, where serious damage was reported. At the end of July the rainfall was in general much below normal except in the Meerut division. The average defect was about 40 per cent. of the normal quantity.

August began well. At first the rain, though sufficient, was irregularly distributed; but by the middle of the month it had become general, and the defect was limited to parts of the Benares and Gorakhpur divisions. In the third week, the situation was full of promise. The large area of autumn crops had made excellent progress. The quick-growing staples, such as maize and the early millets, were already ripening, and their first fruits had brought visible relief in the shape of a timely addition to the food supply. Field work was in full swing, and the demand for labour had rendered it possible to close relief works in all districts except Hardoi. The poorhouse population had substantially diminished, several poorhouses had been closed, and outdoor relief had been curtailed as private charity again became operative. Fodder became plentiful, and the Government forests, which had been thrown open for free grazing, were again closed, though permission to make use of the edible products was continued for the time. The people of the affected tracts were regaining confidence and, equally with the Government and its officers, looked forward to an early termination of all their troubles.

At this period the prospects of the autumn crops were very favourable. The average area cropped at this season for the entire Provinces is rather over 21 millions of acres. Almost 8 per cent. of this is ordinarily irrigated and 92 per cent. unirrigated. In 1896 almost the full normal area was sown and over 15 per cent. of it was irrigated. The area under food crops in this season is ordinarily 82 per cent. of the whole. In 1896 it was 81 per cent. The area of autumn crops was deficient in some districts of the Benares division and in the Lucknow and Gorakhpur divisions owing to the diminished cultivation of rice. In the districts of Jalaun and Fatehpur there was also deficiency; but owing to the favourable character of the early rains of 1896 a larger area than usual was sown chiefly with maize and large millet in the Meerut division, in Bundelkhand, and to a smaller extent in parts of the Agra and Rohilkhand divisions.

Thus the prospects at the end of August were generally favourable. But from the third week of August the rainfall became lighter, and it had practically ceased entirely by the fourth week. At its close the totals for the month were in serious defect in the Agra and Allahabad divisions, which had received only about 60 and 40 per cent. of the normal allowance. Rohilkhand and Fyzabad divisions recorded moderate excess, and elsewhere the fall was normal or in slight defect.

With favourable rain in September a good outturn might have been expected. But instead of fostering weather in September there came the hot winds and the blazing sun of May. Barometric conditions were established which brought the west winds down the Gangetic plain. Over the whole Provinces early in September the skies cleared, and under the hot sun and the dry west wind the scanty moisture rapidly disappeared from the soil. Hope revived when clouds appeared and some showers fell in the eastern districts about the 18th. But the current proved too weak, and in a few days the skies had become clear again and the hot west wind blew as before. Except for a few moderate showers in Mirzapur and Ballia, September was, for all practical purposes, a rainless month.

The drought which characterized September continued into October. Throughout the month the temperature remained abnormally high, the air unusually dry, and the winds much stronger and more westerly than they ought to be. The rainfall of the month was an absolute failure. A few districts recorded a sprinkling, little more effectual than a heavy dew. In the rest the record was a blank. The diagrams in Chapter I bring out clearly the abnormal characteristics which distinguished the monsoon of 1896—particularly the abrupt termination of the rains at the end of August.

RAINFALL BY DIVISIONS, (Plains only), during period 1st June, 1896——31st August, 1896.

Lisbn. T. C. Press, Roorkee—No. 4204-1

The following statement exhibits the percentage of defect of rainfall in each division :—

Divisions.	*The period from 1st May to 31st October.*		
	Actual total.	Normal total.	Percentage of defect.
Meerut (exclusive of Dehra Dún)	21·38	25·85	—20
Agra	13·21	28·46	—54
Rohilkhand	28·59	37·91	—25
Allahabad	19·24	33·73	—43
Benares	24·59	37·29	—34
Gorakhpur	23·37	41·68	—44
Lucknow	21·02	34·79	—40
Fyzabad	25·42	36·68	—31

The maximum defect recurred in the ill-fated Bánda district, which received only 31 per cent. of its average.

The abrupt termination of the monsoon a full month before the normal time was even more injurious than its deficiency. Excessive evaporation proved as harmful as deficient rainfall. Six weeks of hot west winds at a critical period not only destroyed much of the autumn crops which otherwise would have given a moderate yield, but jeopardized the prospects of the spring harvest.

The consequences of this drought, and of the critical condition of the harvests which it entailed, were quick to make themselves manifest.

As the rains held off and a hot wind set in which dried up the soil and withered the crops, a feeling of grave anxiety became apparent. It was not confined to the districts which had already suffered, but spread to other and larger tracts which had hitherto required no special care. The reports which reached Government began to give most gloomy accounts. The standing crops were drying up or being fed down as fodder; the hot hard ground was unfavourable to the sowings of the spring harvest, which were sadly restricted. There was no failure of food supply as stocks were maintained in the distressed tracts by imports which were resumed on a brisk scale and as a great part of the produce of the early autumn crops had been stored in their own houses by the cultivators, who were filled with apprehension for the future. This latter movement, useful in itself, excluded from the market much grain which usually found its way there and so served to enhance prices. The day-labourers soon exhausted the scanty stores they had saved from their grain wages during the short autumn harvest and came to the market as purchasers. Under these influences prices everywhere steadily rose, and before the end of September had in many places reached the famine level.

The following statement compares the prices current on the 1st October for the chief food grains ordinarily consumed with the normal prices, as stated in Appendix A of the Famine Code:—

Seers per Rupee.

	Wheat.	Barley.	Gram.	Rice (common).	*Juár.*	Maize.	*Arhar.*
	Srs. c.	Srs. c.	Srs. c.	Srs. c.	Srs. c.	Srs. c.	Srs. c.
Normal	14 12	19 9	20 12	12 2	20 2	20 14	15 9
1st October 1896 ...	8 13	11 1	10 14	8 14	12 0	13 2	10 13

The immediate effect of this great increase of the prices of food grain was to drive the poorer classes to eke out their diet by such wild produce as they could gather in the fallow and waste lands. Cultivators at this stage had still some reserve from the last crops which they economized by restricting their rations. They still further husbanded their resources by doing, with the help of their own families, a larger share than usual of whatever field labour there was to be done. This again had the effect of further limiting the employment available for day-labourers, who suffered already from the conditions which restricted ploughing and sowing—a limitation which would have been even more serious but for the work afforded by the unusual spread of artificial irrigation, to which reference will presently be made. A feeling of apprehension and unrest became perceptible, first in those tracts which had already passed through one season of distress, and then spreading to fresh regions as prospects grew more gloomy. It showed itself in various characteristic ways. The public works which were still open began to attract more labourers and the poorhouses more inmates. In both cases the new admissions included persons in reduced condition. Private charity contracted, and beggars became numerous in the towns and bazárs. The traditions of the Indian people had made migration the only effective remedy in time of famine. The practice had its origin in the circumstance that no previous Government of the country ever attempted on a systematized and large scale to provide food for famishing people and that, from the imperfection of communications, the task would have been almost hopeless if attempted. But though the conditions have changed the instinct survives, and one of the first symptoms of impending famine is an impulse to wander, whereof indications were now observed. The movement was not serious—it soon ceased; but it was significant. At this stage parties of people from the adjoining Native States were observed passing through British Bundelkhand in search of employment or charity. Some made their way as far as Northern Oudh. This immigration was later on to assume very considerable proportions.

Along with this unsettled feeling could be detected certain symptoms of the spirit of disorder which hunger and distress naturally produce. The sudden increase of prices brought much hardship to those numerous classes who had to purchase their daily supplies, while it brought large profits to the grain-dealers who had laid in stocks when rates were easier. In other and more civilized countries than India it has been common for the masses to attribute famine prices to the concerted machinations of grain merchants, and to proceed to give practical effect to their belief by calling on the authorities to fix and enforce reasonable prices or, where authority is weak and passions strong, by plundering the grain stores. Neither at this nor at any later stage was such a feeling allowed in these Provinces to take active shape in deeds of violence or open defiance of the law. But a few isolated and insignificant occurrences of the sort, although promptly repressed, added significance to the rumours and signs which were now abroad, that such a feeling of exasperation against the grain-dealers was coming into existence and later on might become a force with which Government would have to reckon. Such rumours were themselves a source of danger, for grain-dealers, professing fear of plunder, threatened in some instances to close their shops. Such action would undoubtedly have precipitated a crisis among the people deprived of all means of obtaining food and persuaded that the merchants' object was to hold up their stores and still further multiply their profits.

Another disquieting and significant circumstance was the high rate of mortality reported from many of those districts where distress had prevailed through the summer. Two of the four districts in Bundelkhand and four of the six in Rohilkhand showed death-rates for September which much exceeded the normal mortality, and the October returns were even worse. It was true no starvation deaths were reported, and that special diseases, such as a peculiar form of fever affecting poor and rich alike, accounted for many deaths; but there still remained reason to apprehend that where the crops had failed, scanty or unsuitable nutriment had rendered a portion of the population unusually susceptible to disease or had weakened their power of resistance.

These circumstances arising from an abnormal season, following on seasons also unfavourable, had never ceased to cause anxiety to the Government, and this anxiety grew as September wore on without rain. By the middle of September that situation had become sufficiently grave to call for preparatory or precautionary action; and accordingly on the 21st September this Government sounded the first warning note in a letter addressed to the Commissioners of divisions. In this letter it was pointed out that generally speaking it might be said that, except in parts of

the Agra, Gorakhpur, and Lucknow divisions the state of the crops up to the last week of August had given no substantial ground for anxiety. The rainfall had indeed in almost every district been tardy, and less than the normal quantity had fallen: in several districts very much less; but the rain which had fallen was on the whole opportunely distributed, and the crops had germinated well. But since the latter end of August in some districts, and in others from an even earlier date, there had been no rain of any consequence: the outturn of the early autumn crops had not been good, while in some districts these crops had seriously failed. In view of these warnings—the abnormal character of the season; the damage which the crops had already suffered over large areas; and the reduced circumstances of the people who had experienced a succession of bad harvests—the local officers were directed to take the following steps. *Firstly*, they were directed to make a complete survey of the agricultural condition of each district, which the fiscal organization enabled them without difficulty to do; to ascertain the exact condition of the autumn crops and the prospects of the sowings for the ensuing spring harvest; to estimate the degree of the failure threatened and the extent to which relief would in each event be required. *Secondly*, the District Officers were directed, should their inquiries establish the imminence of serious distress, to begin without further orders to organize the agency and methods of relief which, following the general lines of the Famine Code, were specified in the letter: and where symptoms of distress might appear, to open test relief works. In conclusion it was pointed out by the Lieutenant-Governor that in dealing with famine relief the all-important point to bear in mind was this—that the preparation should be well in advance of the pressure. "If pressure supervenes while preparations are incomplete, numberless embarrassments result. If, on the other hand, the executive is not surprised or overtaken by the famine, matters go as smoothly as in such cases they can go." It was pointed out that if rain were to fall before the end of the month, the situation might be saved, and there might be no necessity to undertake relief measures on a large scale; but "the necessity is not increased by timely preparation; while the cost to the State is greatly lessened and the advantages to the distressed population greatly enhanced by the existence beforehand of a settled programme and an organization ready to be called into immediate activity."

To this call on their energy and local knowledge the Commissioners of divisions, the Collectors of districts, and their various subordinate officers responded well: and to this timely preparation must be attributed much of the success which has rewarded their exertions in dealing with the famine. Experience of famine administration teaches no lesson more clearly than this—that in famine times acute distress appears with

suddenness, and that confusion, loss, and suffering are certain to ensue unless an adequate organization has been matured beforehand and made ready to meet pressure when it comes.

As September drew to its end without any rain, the anxieties of the Government were confirmed, and the time had come to address the Government of India. Accordingly, on the 30th September the Lieutenant-Governor laid before the Governor-General in Council a premonitory statement of the then existing condition of the Provinces, of the mischief already done by the drought, and the steps taken to counteract it; of the extent of the calamity which might be anticipated if no rain should fall; and of the measures which would be adopted to relieve the severe distress which would then inevitably ensue. In particular the various large projects of railway and canal construction which might possibly be undertaken as relief works were arrayed, and the question of food supply and prices were considered. This latter question had begun to agitate the public mind very much: various representations were made to the Lieutenant-Governor in connexion with it by local bodies and influential private individuals: the universal feeling in Native society being that the Government should intervene to stop exportation and to regulate prices. The following extract from a letter, which the Lieutenant-Governor caused to be addressed to one of the Oudh Associations, will explain what attitude this Government took up in this connexion:—

"I am to say, with reference to the first of these proposals, that the Lieutenant-Governor and Chief Commissioner is unable to assent to the proposition that Government should enter into competition with the grain-dealers of the country. So far from being beneficial, such competition would, in His Honor's opinion, be mischievous in the extreme. There is no reason for fearing that private trade will be unequal—while there is good reason for expecting that it will be more than equal—to the task of meeting the demand for grain. It must not be forgotten that the grain trade of the country is of enormous extent; that the free flow of this trade has been immensely facilitated in recent years by the construction of roads and railways (the product of a wise employment of the Famine Insurance Fund); that stocks from other countries are finding their way to remunerative markets here; and that, as the great economist Mr. Mill said (in exposing the errors of the proposal which you renew), 'though a Govern-'ment can do more than any one merchant, it cannot do nearly so much 'as all merchants.' The intervention of Government, more especially at this early stage, would have the effect of crippling, discouraging and disorganizing the existing machinery of private trade for the supply and distribution of grain, without affording any adequate substitute."

Later on the Governor-General in Council, addressing the Government of Bengal, gave the sanction of his great authority to this view of the question. The result has signally vindicated the wisdom of this decision.

October had now been reached, and with it that state of public feeling which has been described in the foregoing

paragraphs. Famine, though imminent, had not actually declared itself: for the people had in the scanty produce of the autumn crops then being harvested something to live upon. The Government had taken measures sufficient to guard against a sudden surprise and to enable it to deal with distress when and where it should arise; and there was nothing more to be done in this direction until the submission of the replies to the Circular letter of the 21st of September should place the Lieutenant-Governor in possession of the actual condition of each locality. But the state of public feeling was threatening, and every rainless day that passed placed in greater jeopardy the prospects of the spring harvest of 1897. A failure of the spring harvest meant utter disaster. Prompted by the dread of such disaster, the plan was conceived of promoting such an extension of artificial irrigation as would counteract to some large extent the deficiencies in the rainfall, save some of the standing crops, and permit of the spring crops being sown. The Lieutenant-Governor's hope was that if by means of artificial irrigation the cultivators were enabled to sow a substantial area, the winter rains would, under God's providence, come, and bring the crop to maturity in ordinary course. Accordingly, throughout October and until the season for sowing the spring crops had ended, the supreme object of this Government's policy and endeavour was to encourage the people to make the utmost use of the canal systems for irrigating the standing crops and preparing the ground for further sowings: and by means of direct advances of Government funds to cultivators and suspensions of the revenue due from the landlords to stimulate the construction of *kachcha* or temporary wells for irrigation purposes. The results of this policy will be exhibited in figured statements in an appendix; but here it may be said that the success attained exceeded all expectation. In normal years the autumn crop area irrigated from canals is 765,000 acres. In 1896 it reached the great total of 1,240,000 acres. In ordinary years the spring crop area irrigated from canals is 1,219,000 acres. In 1896-97 it rose to 1,880,000 acres. As reported by the Chief Engineer in the Irrigation Department:—

"The estimated value of the crops in 1896-97 raised by this irrigation amounts to nearly 13 crores of rupees, the average value of the crops being taken at Rs. 42 per acre—a sum which exceeds by 50 per cent. the total cost of the canals. One and one-half million tons of edible produce were rendered available as food for the people—a quantity sufficient to feed for 12 months one-fifth of the entire population of the North-Western Provinces."

In the canal districts the competition for water was so great that only careful executive management was called for whereby the water should reach the fields with the minimum of delay to the cultivators. But on the Betwa Canal, in the Jalaun district, the Lieutenant-Governor thought it prudent to reduce the water-rates in order to induce the people of

that district, unaccustomed to the use of canal water, to avail themselves of the boon. Partly owing to this reduction in water-rates, partly to other reasons, it came to pass this year that the irrigated area in the Jalaun district rose (to quote from the Chief Engineer's Irrigation Report) from about 8,000 acres in 1894-95 to nearly 82,000 acres. The canal watered altogether 87,306 acres in its three districts.

"In these 87,306 acres no crops could have been grown without the aid of canal water. The value of the crop thus produced is estimated to be 23 lakhs of rupees—a sum equal to one-half the capital cost of the canal. The weight of food produced derived from the irrigated area is estimated at 27,500 tons—a quantity sufficient to feed about one-third of the population of Jalaun for one year."

The Betwa Canal is a protective work and pays as yet no interest on its capital; but without it this year it would have been more than difficult to save the Jalaun district.

But great though these results in the canal districts have been, it was in the districts unprovided with canals, in which category all Oudh falls, that the policy under notice of forcing irrigation received its most striking vindication. It is customary for the Government to assist landholders and tenants by making advances of money for the improvement of their land or the cultivation and protection of their crops. Two Statutes are in force which authorize and control advances of State money for these purposes, prominent among which are masonry wells. These wells can be constructed almost everywhere; but their construction is slow and costly; while water for irrigation was wanted at once. In this emergency the full force and influence of this Government was directed to encouraging the construction of *kachcha* or temporary wells. Over very large tracts of country it is possible to construct cheap temporary wells without any masonry lining, supported at most by an interior framework of rough wickerwork or wattle coils. Where such wells are practicable, the tenantry are skilled in their construction and can make them for a small cost. Each well, it is true, serves but a small area, but many wells would irrigate a large area. When it became evident that the rains had failed and artificial irrigation was necessary to save a portion at least of the crops, and to ensure a successful sowing of the spring crops instructions were issued to District Officers to encourage and assist the people in every way to construct temporary wells, and for this purpose and for the purchase of seed grain the sum of 31 lakhs of rupees in round numbers was, with the sanction of the Governor-General in Council, placed by this Government at their disposal. In view of the special circumstances, these advances were to a large extent made free of the interest usually paid. At the same time steps were taken to associate the landlords with the Government in this measure and thus greatly enlarge its

scope. This was effected by suspensions of revenue whereby the landlords were freed from the necessity of pressing their tenants for rents, while the tenants were enabled to spend in wells what they would have, in other conditions, to pay as rent. Moreover many landlords, relieved from the immediate pressure of the revenue demand, came forward to help their tenants. The suspensions of land revenue sanctioned at this time, with the consent of the Governor-General in Council, amounted to 105 lakhs of rupees. Discretion within this limit was given to the Board of Revenue and to District Officers acting under the Board's control: it was however found possible to secure the desired object by suspending one crore of rupees in round figures.

The effect of these measures can scarcely be over-estimated. Not only did the resources thus placed at the disposal of the people enable them to save crops which would otherwise have perished and cultivate land which would otherwise have lain fallow, but the example thus given roused many who, with the apathy of the fatalist, would have sat waiting events and staking their existence on the chance of rain which did not come. Stimulated by the Officers of Government, who went freely among them urging them to exertion, they shook themselves free of their traditions, and encouraged by the prospects of protection and support in their efforts at self-help, the agricultural community rose to the occasion. A census taken by districts gives the number of temporary wells constructed under this stimulus at the enormous number of 550,759. The number of masonry wells constructed is placed at 4,227, and many others were repaired and improved. Other facilities for irrigation, such as embankments and tanks, were largely extended. Altogether it is calculated that the additions made to the various sources of irrigation at the moment were sufficient to protect 1,381,494 acres and produce 465,000 tons of food. The policy of stimulating the construction of temporary wells was thus signally justified by the result.

The moral effects of these measures were scarcely less beneficial than the material advantages. The Commissioner of the Fyzabad division, writing in November 1896, refers to the advances for wells in these words:—

"I would invite attention to the marked spirit of energy aroused among the agricultural classes by the system introduced of giving timely advances for earthen wells to village communities on the joint security of proprietors and tenants. In many villages a system of co-operative labour has been organized out of the funds so advanced, with the very best results: every man having an interest in seeing that the money is devoted to the purposes for which it was given. The stimulus so imparted has been widespread, and has led indirectly to the construction of many wells other than those paid for out of Government funds. The people have thus responded to the aid so opportunely given them in a manner that must be seen to be realized; and the heart given them has enabled them

to meet the crisis with a spirit that in 25 years' residence in India I have never seen equalled."

The Collector of Cawnpore writes thus, referring particularly to the advances for seed-grain :—

"Everybody was buying corn and nobody would sell at a reasonable price: it was feared that cultivators would not get seed. At this time Government stepped in and gave advances freely. Government officials used their influence with landlords and money-lenders to help their tenants as usual. The moneyed classes, seeing what Government was doing, came forward to give seed. I have no hesitation in saying that if Government had not given advances on a large scale, then the area sown would have been very much less. It was not merely the actual sum distributed which made the difference, but the feeling of confidence engendered. It was the '*Ikbal-i-Sarkár*,' and to use a colloquial phrase, Government was 'backing its luck.'"

Besides the advances made by Government under the Agricultural Loans and the Land Improvements Acts to which reference has now been made, great assistance at this time was given by the operations of the Opium Department. The statistics furnished by the Benares Agency show that advances made for construction and repair of wells during the famine period aggregate about a lakh of rupees and represent an addition of about 37,500 acres to the irrigated area. The other sums paid in advances to poppy cultivators between July and December 1896 amount to no less than Rs. 35,40,000. This very large sum, which represents in effect a vast number of loans made without interest to the cultivating classes, gave most valuable and opportune assistance to a large number of distressed districts. In one of them alone—Rae Bareli—the villagers received in this way loans amounting to almost $2\frac{3}{4}$ lakhs of rupees. Later on in the spring of 1897, when the opium was gathered and weighed in, payments were made to the cultivators aggregating over 84 lakhs, and when the accounts were finally closed in October the further payments then made came to about $13\frac{1}{2}$ lakhs. Besides these large sums about $34\frac{1}{2}$ lakhs were advanced from August to October 1897 on account of the coming crop. The cultivators of these Provinces were thus financed during the Scarcity period by the Opium Department to the extent of nearly $168\frac{1}{2}$ lakhs of rupees (equal to over one million sterling at current rates of exchange). Nearly all these transactions took place in distressed districts, as poppy is not grown in the Meerut and Kumaun divisions, which alone escaped the famine.

Satisfactory as was the material outcome of these measures, their moral result in securing the peace and order of the community was no less beneficent. By this time the people had begun to realize their position. The autumn crops had failed disastrously in extensive regions; the spring crops were threatened with equal failure; prices had already reached famine height; stocks had run low, and the food supply at any price seemed precarious to many. The people found themselves

face to face with a famine, and by their traditions a famine meant starvation, death or wholesale migration. State relief on the scale that has now been given had not entered into their conceptions. A feeling of apprehension and unrest had arisen which had its dangerous aspect. There were ominous signs that a spirit of turbulence was growing among those classes who would not quietly submit to starve while there was food for others. In other famines such signs have found visible shape in gang robberies, incendiary fires which give opportunities for plunder, food-snatching from shops, the multiplication of petty thefts; and have been reflected in the panics which led grain-dealers to close their stores. Some of these crimes occurred in these Provinces in October 1896, but they were never aggravated; and the authorities were prompt and powerful to repress them. But to Government, watching the signs of popular feeling, they were significant and disquieting. At this crisis the action of the Government which has been now described turned the minds of the people to peaceful pursuits, supplied them with means to secure a substantial part of the harvest which nature was denying, and by ensuring a crop to watch and tend and reap, bound them to their homes. Above all it created a feeling of confidence that Government was alive to their difficulties and prepared to protect and assist them with all its great resources. The forces which make for order were rallied and the bonds of society which showed signs of relaxation were drawn tight again. Thenceforth crime ran in the ordinary lines, as will be shown in the sequel. Offences were, it is true, far more numerous than in times of plenty; but they were mostly pilferings, the work of individuals rarely moved by a common or concerted motive, and not the outcome of a spirit in which the body of the people shared or sympathized. The community as a whole displayed a spirit of patience and discipline so admirable and so general, that it was deemed unnecessary to strengthen, to any appreciable extent, the ordinary police force of the Provinces. On the great Public Works which found employment for more than a million and a quarter of people order was preserved by the people themselves.

One other protective measure should be noticed here. When it became apparent that there would be an extensive failure of the ordinary crops, District Officers were consulted as to the desirability of encouraging and assisting the cultivation of quick-growing vegetables, which mature rapidly and yield a large outturn in a small area—an important point where water for irrigation was scarce. The general opinion was favourable to the proposal, and carrot and potato seed were selected as the most suitable and generally used. Potato seed was procurable from the hill districts and other localities not affected by scarcity in sufficient quantities. Indigenous

carrot seed was also to some extent procured and distributed among the people; but the quantity available proved quite insufficient to meet the demands of District Officers, and indents were made on the Government of India and the Secretary of State for large quantities of European seed. The response was prompt and helpful, but the larger portion of the consignments arrived late. It was found that the imported seed requires the whole cold weather to mature and must, to be thoroughly successful, be in the ground by October. The portion of the English seed which arrived first turned out moderately well; but on the whole the seed did not yield the results which were hoped from it. The real value of this resource in time of famine will not be known till the coming year shows the outturn of the seed which remained unsown, and which has been held over for timely planting this year.

The indigenous or acclimatized carrot seed germinated excellently, and though the potato seed did not do so well in some districts, yet the general result proved most beneficial. An unusually large quantity of cheap and wholesome vegetables became available in advance of the ordinary spring cereals, and made a timely and valuable addition to the food supply of the people.

Reference has already been made to an important measure of relief: namely the suspension of portion of the land revenue; but a more detailed reference to the matter is desirable. The land revenue instalments which are paid out of the proceeds of the autumn harvest fall due in these Provinces, generally speaking, in November and December. When the time for collection drew near, it became evident that in the distressed tracts many of the poorer proprietors would be unable to meet their liabilities or would be able to meet them only by recourse to the moneylender. Lenience in enforcing the claims of the State on revenue-payers was clearly necessary, and accordingly inquiries were set on foot and the resources of the revenue-payers and their claims to consideration were duly weighed. In districts and villages where the crops had succeeded the high prices of produce placed both tenants and proprietors in a position to meet their engagements with unusual ease. Where the crops had failed, the condition of the agricultural community called for moderation in enforcing the State demand. In the end sums aggregating in round figures one crore of rupees were suspended out of the autumn demand and held over for future consideration.

Later on, when the spring instalments of revenue fell due in May and June 1897, further suspensions were made, aggregating about 44½ lakhs of rupees, while fresh enhancements of revenue in Oudh, amounting to about 3 lakhs of rupees, were postponed. The total suspensions made on the autumn and spring land revenue instalments amounted, therefore to nearly one and one-half crores of rupees.

This large measure of relief had an excellent effect on the capacity of the people to withstand the pressure of hard times. It saved the landholder from grave embarrassment, freed him from the necessity of contracting debt, and left him in a better position to assist his tenantry. It saved the tenantry from the full pressure of paying their rent. By the law of the North-Western Provinces the suspension of revenue to the landholder carries with it a suspension of double the amount in rent to the cultivator. Though no such provision exists in the Oudh law, yet the proprietors were at least relieved from the necessity of forcing on their rent collections, and but few instances have come to the Lieutenant-Governor's notice in which the Talúqdárs of Oudh have not shown to their tenantry the same lenience which Government has shown to them.

Since the termination of the Famine the Lieutenant-Governor has, in conference with the Board of Revenue and in the light of the most recent local information on the state of the country and condition of the people, considered how far these suspensions should be entirely remitted and written off the Government accounts as irrecoverable. The country had passed through a trial of very great severity; and although wonderful recuperative power had been shown, there was no doubt that cultivation and industry would be depressed by the burden of debt, while it would be stimulated and encouraged by the reduction of the arrears within moderate limits. The conclusion arrived at was that, subject to the approval of the Government of India, offers should be made to the landlords to write off 60 lakhs, or about 42 per cent., of the arrears on condition that the remissions were passed on to their tenants in accordance with the relevant provisions of the law referred to above. The Governor-General in Council has now signified his approval of this liberal measure of remission. The balance of the arrears will be collected by instalments commencing from next spring and extending over two years. Thus the land-owning and cultivating classes of these Provinces will be enabled to replenish their grain stores from the present abundant harvest and to face the future with cheerfulness.

CHAPTER IV.

Extent of the failure of the "kharif" *or autumn harvest of* 1896.

In the preceding chapter the nature of the failure in the monsoon of 1896 and the efforts made to counteract its worst effects have been stated: it is now necessary to display the effects which the failure produced on the autumn crops which form the chief sustenance of the poorer classes of the people of these Provinces; and in the prospects of the ensuing *rabi* or spring crops.

The reports of the various Commissioners and District Officers, rendered in response to the call made on 21st September, and subsequently supplemented by detailed statistics furnished by the Agricultural Department, showed that, generally speaking, the harvest was good in the Meerut division and in the canal-irrigated parts of the Agra division; that there was considerable failure in the remainder of the Agra division, in part of Rohilkhand, the north of Oudh, and parts of the Benares district; still more severe failure in the rest of Rohilkhand and parts of the Gorakhpur, Fyzabad, and Allahabad divisions, and that the failure was greatest in the Lucknow division and in outlying districts to the east and south. The area least affected contained about 12,000 square miles with a population of about six millions: the area of considerable failure consisted of something under 25,000 square miles with a population of 12½ millions. The area of severe failure covered 31,000 square miles with a population of something over 13½ millions, while the area of greatest loss contained something over 25,000 square miles also with about 13½ million people. The area of the Kumaun division is excluded from these calculations, as from the beginning its condition was not such as to cause disquietude.

In the first of these four portions the autumn harvest yielded not less than three-fourths of the normal outturn, and here no difficulties were experienced except such as arise from sustained high prices; in the second portion the outturn varied from one-half to three-fourths of a normal yield; in the third portion the outturn fell between one-third and one-half; but in the fourth portion the outturn did not exceed one-third of an average harvest with considerable areas of total failure. The circumstances of Bundelkhand, however, which had suffered from famine in the spring, summer, and early autumn, and which thus entered on the period of greater stress with greatly reduced resources, call for its classification with the worst portion, although in three out of its four districts the

outturn of the autumn crops slightly exceeded one-third of an average harvest. In this way the area of greatest failure may be regarded as covering about 35,000 square miles with a population of 15¾ millions.

An estimate has been framed by the Director of Land Records and Agriculture, which aims at showing how far the actual outturn of the autumn harvest fell short of an average outturn. In this estimate due allowance is made for the failure of those crops which, though included in the sowings, never bore fruit. The best calculations which can be made on this basis show that the outturn of food crops of the autumn harvest was only 39·25 per cent. of an average yield. Sugarcane and the *arhar* pulse have not been included in this estimate, because, though sown with the autumn crops, they are gathered with the spring harvest; but the estimate includes the area of the larger millet *(jawár)* recorded as "food crop." This millet is, however, also very largely grown as a fodder crop, and it happened this year that a great deal sown for food was eventually cut for fodder. It is a large crop, and if allowance is made for the transfer from food to fodder area, the total provincial outturn of the autumn harvest will be reduced to 38 per cent. of an average harvest.

Though the heaviest failure was in rice, yet it has not followed that the largest rice-growing districts were the most seriously affected. Rice is always a more or less precarious crop, being dependent not only on sufficient but on timely rainfall. The failure of a single crop does not involve acute distress, as a full rice harvest will carry the cultivator through one or two poor seasons. But in many districts the harvests before 1896 had been poor, and it was in those districts where the people had been impoverished by several successive years of deficiency that the failure of the autumn crops of 1896 was followed by the most serious consequences which this narrative discloses.

The Director of Land Records and Agriculture has submitted estimates quantifying the loss of food grain thus caused. A great deal of uncertainty enters into all quantifications of crop outturn or crop failure, and nothing more than an approximation to the truth can be claimed for them. But with this qualification it may be said that in an average year the total yield of food grain from the autumn harvest in these Provinces is estimated to be 5,370,000 tons. Last year the yield was about 2,055,000 tons. The loss was therefore 3,315,000 tons, which at normal prices may be valued at not less than 16½ crores of rupees (about 11 millions sterling at current rates of exchange). If it be remembered that the coarse rice, the great and lesser millets, and the maize, all of which are autumn crop staples, furnish the ordinary food of the poorer classes, it will be at once perceived what a terrible disaster had overtaken the Provinces.

The forecast of the ensuing spring crops increased the gloom, as the area of the spring sowings was estimated at this time to be only 58 per cent. of the normal cultivation. Fields which had not been ploughed while the rains still continued became baked and would not yield to the share. This was specially the case in the double-cropped lands, for the rains had ceased before the autumn crops could be removed from them. To a great extent they had to lie fallow. Even where the land could be ploughed, the dry and heated soil was adverse to the germination of the seed. The gram crop, which is the earliest sown and is a coarse staple largely consumed by men as well as by animals, suffered so severely that later on its price exceeded that of wheat. It was in this emergency that the construction of temporary wells already referred to was forced on; and even this resource—the unusual and forlorn resource of irrigation to secure the spring sowings—was contracted by the extraordinary demand for water to irrigate the standing crops. In the canal districts, where a large supply of water was available, the area usually watered for the purpose of sowing is quite inconsiderable: in 1896 almost the entire irrigated area (1,888,125 acres) was so treated, although in these districts the later rains had not failed so completely as elsewhere. On the whole, there were at this time serious apprehensions that the failure of the autumn harvest would be followed by an equal or even greater failure of the spring harvest.

The extent to which each part of the Provinces suffered from these adverse conditions will be shown hereafter in more detail. But here it may be noticed that the deficiency of the rainfall and the other obstacles to the cultivation of the spring crops pressed most heavily on the unfortunate Bundelkhand districts, where the area sown for spring reaping varied from about one-fourth to one-half of the usual extent, and what was sown remained much more dependent here than elsewhere on the further rainfall for its security. By the same fatality the afflicted district of Hardoi came off worse than any of its neighbours in Oudh or Rohilkhand. One-half its fields remained unsown.

All these facts bear witness to the severity of the failure in the autumn and to the poor prospects of the spring harvest, and taken in conjunction with the agitated condition of public feeling which prevailed, they placed beyond doubt the imminence of a great famine in large regions and scarcity in the rest of the Provinces. Opinions differed as to the degree of destitution which would prevail before the next year's harvests should have replenished the food supply; but District Officers were satisfied that if widespread mortality from starvation was to be avoided, Government would have in the interval to support for six months a daily average of it

might be one million, or it might even be nearly two millions of souls. The least sanguine estimate placed the maximum number that would require relief for one day at 335 millions: while even the most sanguine estimate did not place this number at less than two-thirds of that appalling total. The numbers that actually came on relief were 284 millions, exclusive of 30 millions more relieved from the Indian Charitable Relief Fund.

CHAPTER V.

Organization of the Relief System.

SUCH was the state of affairs when in the end of October the Lieutenant-Governor commenced his tours through the famine and scarcity districts, which with necessary intermissions lasted till the end of July 1897. The objects of the first tour were these. In the first place the Lieutenant-Governor wished, being himself newly come to the Provinces, to make the acquaintance of every gazetted officer on whom, each in his own sphere, would devolve the duty of carrying out the relief system according to the principles of the Famine Code or the orders of Government. In the serious business on which all were entering success might often depend on the choice of particular men for particular duties and on the establishment of harmonious relations between the Head of the Government and the local officials. (In testimony to the high average of administrative capacity possessed by the services of these Provinces be it here said that the Lieutenant-Governor during the entire campaign hardly ever found it necessary to remove any officer from the position in which the previous accident of service had placed him.) But the chief objects of the first tour were these—in conference on the spot with the officers of each division, the Commissioner, District Officers, Sub-Divisional Officers, Police Officers, Medical Officers and officers of the Public Works Department, to examine again in detail the condition of each district in turn; to gauge in the light of the agricultural statistics for each district, which had now been verified, the degree of crop failure and the extent of the impending distress; to fix the strength of the establishments which to begin with (for they were expanded afterwards with the rise of pressure) were necessary to dispense relief and conduct the administration; to scrutinize the programme of relief works and guard against any works—except works of public utility—being undertaken from public funds; to assert the principle that the Commissioner should have within his division control of all relief agencies (his control over the Public Works Department not, however, extending to professional matters), and the Collector similar control within his district; subject to the preceding principle to allot to the Public Works Department its proper sphere of action and to Civil Officers their legitimate field of activity; to prescribe the functions of the Civil Officers and their subordinates in promoting village relief works, stimulating private charity and controlling the great field of gratuitous relief; and to establish independent local relief committees as an auxiliary to official endeavour. Generally speaking, the Lieutenant-Governor wished in these early

tours to receive suggestions, explain his own views, and decide doubtful points in the light of the best local knowledge.

The preceding objects were concerned chiefly with the organization of official action; but the Lieutenant-Governor was specially anxious to bring the Government from the very beginning into close touch with the landlords of each district and to associate them each in his own estate with the Government in the administration of relief and especially in bearing part of the cost of and the carrying out of village relief works. With this object informal darbárs or conferences of landlords and other influential local residents were held at all divisional headquarters: they were repeated afterwards at district stations for the particular district. These darbárs or conferences were very largely attended, and resulted in the establishment of cordial relations between the authorities on the one hand and the landed proprietors on the other, whereby the administration of relief has been much benefited. At these conferences the landlords were not slow to represent their own difficulties, which in many instances were further explained at private interviews with the Lieutenant-Governor, and the information thus gained was of great use in enabling the Government to see how far joint action and responsibility with the landlords was practicable and to decide on the precise extent to which the collection of the land revenue should be suspended pending the advent of better times.

The result of the Lieutenant-Governor's first tour was reported to the Government of India on the 23rd November in a letter which, with its appendices, displayed in detail the exact position of each district in regard to the failure of the autumn crop; the prospects of the spring harvest; the state of the markets; the anticipations of famine or distress; the magnitude of the difficulties to be dealt with; the manner in which the Provincial Government intended to deal with them, and other relevant circumstances calculated to place the Governor-General in Council in possession of all the facts of the situation. This letter with its appendices was subsequently published in the *Gazette of India* for general information.

It will be convenient at this stage to describe in some detail the relief organization which has been adopted in these Provinces: for although it followed in the main the principles of the Famine Code, experience dictated the necessity of various additions to, and modifications of, the Code rules. These additions and modifications were introduced at various times on the suggestion of actual practice and necessity, and it was not until February 1897 that the system assumed in all respects its final shape. But the following description will give the finished product without regard to the sequence of improvement or development.

The principle which guided and inspired the administration of relief was at an early date declared in the following words :—

"The only limitation to the relief to be given will be the necessities of the people."

It is believed that this principle is reflected and preserved in each branch of the relief system of these Provinces now to be described. But the task of making each department instinct with this principle, and at the same time safeguarding it from dishonesty and lavishness, committed the Administration to constant struggles with chicanery and deceit. It is not suggested that assistance never reached those who might have dispensed with it, or that it was never intercepted, or that imposture was always unsuccessful. To the importunacies of the multitudes to be dealt with, there was no limit or restraint, while rapacious subordinates could not always be at once detected. But as the staff settled down to their work, the opportunities for deception or peculation were narrowed down, till it is believed that from an early stage of the operations but little Government money reached the hands of any who did not stand in real need of it.

The relief system prescribed by the Famine Code may be classified as follows :—

I.—Employment on large relief works entered on the administrative programme (Article 17 of the Code) and controlled by the Department of Public Works.

II.—Employment on small relief works (Article 65 of the Code) controlled by District Officers.

III.—Employment at their homes for indigent respectable people who are incapable of labour on relief works or debarred by national custom from appearing in public.

IV.—Gratuitous distribution of relief in poorhouses, State kitchens and hospitals to the poor and infirm unable to labour, until they had have become fit to labour, or to be sent back to their homes.

V.—Gratuitous distribution of relief at their homes to persons who are unable to labour and are reduced to distress.

Relief Works.

The first, and numerically the most important, form was relief works designed to afford employment to all who could not find it elsewhere and could not subsist without it. It was a cardinal principle of relief administration in the North-Western Provinces and Oudh that some labour should be exacted from everyone seeking relief who was not incapacitated for work by age or infirmity, or in rare cases (chiefly in case of women) by social status. From the able-bodied a full task,

from the weakly and from the children over 7 years of age a smaller task, graduated according to their various capacities, was required. This was the key-note of the system, and in judging of the system's material results, should not be forgotten. In pursuance of this principle vast numbers of inefficient labourers have been employed (to the lowering of the outturn of work done per rupee of expenditure); but it was deliberately decided that in the best interests of the people themselves industry should be encouraged and idleness or sloth discouraged. The best proof of the complete success of the policy adopted is to be found in the fact noticed in the sequel, that the relief works had no attraction, and that on the first opportunity the people returned, undemoralized and with cheerfulness, to their ordinary avocations.

Relief works were divided into two classes: (1) large projects of general utility affording employment to usually not less than 5,000 labourers, the bulk of whom were obliged to leave their homes and reside on or in the neighbourhood of the works; and (2) lesser projects, serving some local purpose and affording occupation to a smaller number of workers in the neighbourhood of their homes. The former class were managed by the Public Works Department: the latter were controlled by the District Officer through his immediate subordinates or through the resident village proprietors. In both alike earthwork was the almost universal employment as being the only one suited for unskilled labour. The embankment of roads and the excavation of tanks were the chief projects selected.

The first step on a large work is to divide the work-people into gangs containing a certain number of groups of diggers and carriers (usually one digger to three carriers), and aggregating about 60 effective workers. To each gang is assigned a certain measured task, calculated to represent a reasonable day's work for average unskilled workers, and this task is usually subdivided among the component groups. Weakly persons are assigned proportionally smaller tasks. When the allotted task is finished, the labourers are free to go, having earned the daily wage calculated, on a sliding scale according to the price of grain, as sufficient to purchase a day's ration. Under this system it is not open to the labourers to earn a higher wage by doing a larger task. If the allotted task was not completed, a proportional deduction was made from the wages of the entire gang or of the group of labourers who were at fault, subject to a minimum which represents a penal or bare subsistence ration. Below this wages could not be reduced. The object of the arrangement was to secure to each person sufficient to maintain life in return for a reasonable task, and at the same time to make the work unattractive to persons who could support themselves or find employment elsewhere. The system did not enable

workers to earn enough to support those helpless members of their families who must remain with them and cannot earn their own living. Gratuitous relief was accordingly provided at the works for those dependants who, from age or infirmity, were themselves unable to render any task. The great bulk of the dependants were young children who formed about 90 per cent. of the whole dependant class. Dependants were paid on the lower scale provided for non-workers. They have naturally been more numerous at some places and seasons than at others; but from first to last the provincial average was one dependant for every five workers.

The Famine Code lays down that "while in the late stage of a famine 'large works' will be the backbone of the system of relief, small works should be utilized in the early days of a 'scarcity.'" From this principle the Lieutenant-Governor found it desirable to depart, for reasons which were duly communicated to the Government of India. While utilizing small works at all seasons to meet urgent demands for relief, he found it advantageous to employ them chiefly when the advance of the hot weather and the scarcity of water or the outbreak of cholera had, in many localities, rendered it difficult or dangerous to keep large crowds of workpeople assembled in one place. But from the time famine declared itself till the works were finally closed, large works as a rule formed the backbone of the system wherever there were large numbers seeking employment and no natural obstacles, such as dearth of drinking water, interposed to render such projects impracticable. It is far easier to provide on large works than on small works that unceasing supervision of European officers which is essentially necessary to preserve proper organization.

The form of relief employment above described was restricted to "famine districts," that is districts in which distress was acute. But in "scarcity districts," that is in regions where distress was less severe, another form of relief work was employed which stands half-way between the Famine Code works just described and the system of contract labour by which public works are executed in ordinary years. It has been designated the "Intermediate system." A full description of the circumstances which led to its adoption will be found later on; but here it may be said that the essential difference between it and the system prescribed by the Famine Code is the substitution of piece-work for task-work and the exclusion of the minimum wage. Rates are prescribed and payments made according to the amount of work done; but a maximum task is fixed which limits the amount that can be earned in one day. The amount earned is divided between the diggers and carriers according to a fixed scale. The object of the system is to secure a proper outturn of work for the money paid, to prevent the congregation of a large number of ineffective workers, and to encourage

or enforce industry. At the same time the maximum task operates to prevent earnings becoming more than sufficient for reasonable subsistence. Under this system free doles are not given to dependants of the works, but the rates and tasks are so fixed as to permit workers earning enough to support the non-working members of their families. In some localities where this system was enforced it was found necessary to distribute free rations of cooked food to the very young children of the workpeople. This additional relief was not necessitated by any deficiency in the rates of earnings, but by the callous neglect of their children by parents whose natural instincts were weakened by continued scarcity. The same necessity arose sometimes on Code works and even in home relief where the cash doles given to children were appropriated by their parents, and the authorities were compelled to substitute cooked food and see it eaten by the children in their presence. This method of relief was known as State kitchens. To these arrangements, which illustrate, with perhaps a lurid light, the difficulties against which Relief Officers had to contend, thousands of little children owe their lives.

Besides the relief works carried out by the officers of the Public Works Department a number of relief works were executed by private persons, either in a purely charitable spirit at their own expense or with the assistance of subventions by Government. Both alike usually took the shape of improvements in the estates of the persons concerned, the most common being the excavation of tanks. The former were entirely under private management. For the latter the cost of the project, according to official plans and estimates, was advanced by Government and an engagement taken from the person receiving it to repay within a certain time a fixed portion, generally one-half, of the entire outlay. The management of the work was left to the proprietor; but he was bound to pay labour at specified rates, and the work was kept under regular inspection to ensure that the funds were properly applied and the relief afforded to those who required it.

Home Employment.

One more form of relief work remains to be enumerated. Women of a respectable class accustomed to support themselves wholly or in part by needlework, embroidery, and kindred occupations, men of good birth, unused to any form of labour, decayed families whose scanty means were outrun by famine prices—for such classes home work of a suitable character was provided without the loss of self-respect involved in the acceptance of charity. No class of the community demanded more commiseration than these patient sufferers, who would starve and die in silence rather than seek or accept alms. Such persons were sought out and relieved through the agency of private persons of their own community. This form of relief was most commonly required in

towns, and the cost was largely met from private subscriptions and the Indian Famine Fund, assisted by liberal State subventions. But the agency of distribution was under official control.

In several cities arrangements were made to find work at their own trades for artizans, chiefly weavers, whom the prevailing distress had deprived of employment. In Benares in particular, which contains a large community of impoverished weavers, numbers were thus enabled to carry on their ordinary occupation.

Gratuitous Relief.

In the ways enumerated above, employment was provided for all who required relief and were able to work. But beyond these is a great multitude of persons who are unfit for labour and accustomed to rely on others for their subsistence. Such persons do not comprise merely the ordinary mendicants who trust to the charity of the public, but also the helpless members of families who in all countries are a burden on their natural protectors. What may be called domestic charity is very far-reaching in India: it requires that those of all classes who have means should support or assist their distant relations, connections, and even caste brethren, who in Western countries would be left to State relief. This social piety is in fact the Indian substitute for the poor law of England.

For the members of these classes who were unfit for work it became necessary to provide gratuitous relief. As distress intensified and the resources of the people became exhausted, the efficiency of private and domestic charity was weakened. The poor were less and less able to support their poor dependants, and State intervention became necessary. Gratuitous relief was provided in different forms. One has been already described—the grant of free doles to the dependants of labourers on relief works. The rest may be divided under the two heads of the *poorhouse* and the distribution of *outdoor or home relief*.

Poorhouses were established at all district and subdivisional headquarters in famine districts and in suitable centres in the districts which were less distressed. They were open to all who were willing to submit to the test of residence and the necessary discipline. Except in the few cases where a suitable structure was already available, the buildings were of a temporary character, constructed on certain uniform principles to secure the health, safety and comfort of the inmates. Arrangements were made for cooking, sanitation and conservancy. Hospital accommodation and medical aid were provided, and clothes or blankets were supplied to those who required them, either at State expense or at the cost of the Indian Famine Fund. Though every

care was taken to avoid caste objections and to secure the well-being of the inmates, yet poorhouse life was always repugnant to the people generally. The inmates consisted so largely of persons broken down by disease or infirmity that the institutions might have been more correctly described as infirmaries. Whatever there was of repulsive or shocking in the aspects of the famine, was to be found in the poorhouses, which, broadly speaking, were asylums for the reception of starving vagrants or homeless cripples.

The place occupied by the poorhouse in the scheme of relief operations was that of receiving house or temporary shelter for all who could not be otherwise relieved. The only permanent inmates were the infirm vagrants. The rules required the District Officer to sort out periodically the inmates of the poorhouse, to draft to the relief works those who were capable of labour, and to send to their homes those helpless ones who had any fixed residence, there to be brought on the village relief lists. In this way it was designed that the gratuitous relief system should consist, broadly speaking, of two great forms: *first*, relief on works for all in need of relief who were able to labour and their dependants; *second*, relief at their homes for all unable to labour, but in need of relief. The poorhouse remained then the refuge of the homeless infirm from whom it was hardly ever possible to exact labour. But when the inmates could work they were made to work.

It may here be also stated that the orphans and other deserted famine waifs were collected, generally at district headquarters, in an orphanage, where they received special treatment. After a short residence the children were found to improve immensely in health and physique.

Outdoor or home relief required a very elaborate organization and a very extensive agency. Its aim was to seek out in their own homes all those who had been deprived of their ordinary means of support and were unable to work for their living, to test the reality of their claims, to bring them on a free list, to arrange for the regular payment of the allowances which, according to the fixed scale, might be found necessary for their support, and to strike off their names as soon as they appeared in a position to earn their own support or to claim it from any one able and bound to maintain them. These operations were carried out in every village in the famine districts, covering an area of 44,000 square miles with a population of 20½ millions, and with less exhaustiveness in the "Scarcity" area of 28,000 square miles with a population of 14½ millions.

The task was a comparatively simple one in towns where the people were collected within narrow limits and where voluntary agency was largely available. But for the

rural tracts the task was so enormous that it could not have been effectively and economically discharged without the agency already existing in these Provinces for the purposes of revenue and general administration. For fiscal and executive purposes the North-Western Provinces and Oudh are divided into divisions varying from about 10,000 to 17,000 square miles in area and presided over by a Commissioner. These divisions are again divided into districts with an average area of about 2,000 square miles and controlled by a Collector-Magistrate or District Officer. Every district is subdivided into subdivisions called *tahsíls*, which again are split up into blocks or circles called "*kanúngo's* circles," and these *kanúngo's* circles are again subdivided till the village or a group of hamlets is reached. The village is under the charge of a "*patwári*" or village accountant, who is a Government official, resides permanently in his village or group, and is personally acquainted with all its inhabitants. Over each circle of villages is a *kanúngo* or revenue supervisor and over each group of circles or *tahsíl* is a *tahsíldár*. One or more "tahsíls" are under the executive charge of a superior officer, an Assistant or Deputy Collector.

This organization, which was taken as the basis of the relief system, was utilized to the fullest extent. Instead of attempting to introduce a new and special famine organization the original framework of the district administration was maintained and strengthened. Even the usual nomenclature with which the people and the officials are familiar was retained. The original relief circles coincided with the kanúngos' (revenue supervisors') circles—the kanúngo became the circle officer, and the special staff appointed to the same duty were styled additional or assistant kanúngo. Even the officers in civil charge of relief works were known as relief náib (or assistant) tahsíldárs, and special relief officers of a superior grade were designated relief tahsíldárs. The existing district staff was everywhere utilized to the fullest extent in carrying out relief measures.

In these and other ways it was sought to work on lines with which the officials and the people were acquainted, to preserve official designations which in the people's minds imported a definite degree of responsibility, and to avoid the difficulties which might have arisen in building up an organization which would be unfamiliar to those who had to work it, and might be viewed with suspicion by the people. It was rarely found necessary to increase the "patwári" staff or to subdivide the territorial unit entrusted to these officials. But the number of revenue supervisors and assistant tahsíldárs was largely increased, each class being as far as possible recruited from the grade below, so as to secure the advantage of local knowledge and experience while stimulating zeal by promotion. Trained men were also drafted from districts not

affected by distress, and the services of approved candidates for Government service were freely utilized. The extent of country controlled by these officers, each in his own grade, varied in extent according to the physical conditions and intensity of distress in each district. Where communications were difficult or when the prevalence of acute distress required close and sustained scrutiny, the area and population under each officer were narrowed down to limits he could effectively control. Under different conditions, larger charges, it was found, could be managed by a single officer. The organization was commenced early in the famine by taking in every case the supervisor (kanúngo) circle as the unit, and these were subsequently subdivided and additional kanúngos appointed where circumstances demanded according to the growing pressure of distress. As the hot weather and rains drew on and travelling became more difficult the charges were further narrowed. In the 19 districts officially recognised as famine-stricken there were 467 circles with an average area of 95 square miles and population of 44,000. In the 18 districts classed as "scarcity districts," there were 225 circles averaging 125 square miles in area and 64,000 in population. Within these original circles again sub-circles were formed as pressure increased and it became necessary to lighten the charges.

The rules drawn up to guide officers in determining the proper recipients for gratuitous home relief are printed in the Appendix. Briefly it may be stated that lists were primarily drawn up by circle officers with the assistance of the village accountant and head-man, the proprietor or his agent, and respectable inhabitants of the place. These lists were made the basis of the subsequent procedure, which was as follows. The whole population of each village in turn in the distressed districts was mustered excepting those whose sex and status forbade them to appear in public. Those who were absent from the village were first accounted for. Then those present who were fit objects for relief were sifted out, and after due inquiry placed on the free list either as permanent or temporary recipients of relief. A *panchâyet* or committee of the respectable inhabitants of the village was then formed, and the claims of the "*parda-nashín*" women and others of that class were considered and allowances were allotted when deserved and required. Thus the entire population of the village—men, women, and children—were passed under review, so that no individual might escape notice or suffer from want of food. The lists so framed were tested and corrected by the superior staff visiting each village in turn, and were in all cases brought under examination by a European officer of the covenanted or commissioned grades. Recipients were furnished with printed tickets corresponding with the lists and showing the amount of relief to which they were entitled. Thereafter each village was visited so far as

possible once every week or ten days by the circle or other superior Relief Officer whose duty it was to review the lists, muster the recipients (excepting women who could not appear in public), remove the names of those no longer entitled to relief, and bring on the lists any new persons who might be shown to be eligible.

The allowances were distributed in weekly or fortnightly doles through the village accountant, head-man or landholder nominated for the purpose; and it was the duty of the circle and supervising officers to see that no fraud was practised on the recipients or on the State.

This village relief was ordinarily given in cash. But, as explained in the case of dependants of workers, it was sometimes found necessary to provide relief in the shape of cooked food for children neglected and starved by parents who appropriated the cash doles for their own uses. In such cases kitchens were established at suitable centres and food distributed to the children who assembled to receive it.

In cities committees were formed consisting of official and non-official members, and directed by the District Officer or City Magistrate. The various quarters or wards of the city were divided between the members, and a house-to-house visitation established to ascertain the persons who stood in need of relief. The great bulk of these were persons, chiefly women and children, of respectable position whose occupation had failed from the pressure of hard times or whose scanty means no longer afforded a subsistence at the high prices prevailing. Such persons were disabled by the custom of the country and their family pride from appearing in public or asking charity. It was in numerous cases even a task of much difficulty to induce them to accept relief or to present it in a form which they could accept without loss of status and self-respect. Considerable difficulty was experienced at first in establishing this system of home relief.

The difficulty was enhanced by the mistrust which attaches to a measure for which there was little precedent, and whereof the motives were imperfectly understood. To mistrust was added the difficulty arising from caste. Many destitute people refused relief at first from fear that it would be followed by expulsion from their brotherhood. Curiously enough these cases were observed among the lower castes and were not confined to people who had a social position to forfeit. It required much judgment and infinite patience to meet both these unreasonable objections and the more reasonable ones based on a commendable feeling of self-respect and independence. For many women of the better class home employment was provided in the shape of needlework, embroidery, and the like, or a market was found for their work. Every city contains houses of good and even imposing appearance, the survival of past wealth, with inmates sunk in the direst poverty. Not even the nearest neighbours or distributors

of relief always knew the amount of silent suffering concealed within such walls. Many devices were employed to ascertain such cases and convey relief in an unobtrusive or secret way, and in the shape least calculated to hurt the susceptibilities of the recipients. In work such as this the services of native gentlemen and of European gentlemen and ladies connected with the various missions or charitable associations were found of the greatest value and fully utilized. The bare subsistence provided by the State was supplemented through the same agency by little comforts from funds provided for the purpose by the Famine Relief Fund.

Casual Relief.

Besides the regular relief afforded in poorhouses and by the organized village system, provision was made to meet the case of destitute wanderers at a distance from the relief centres. To this end money was entrusted to police officers, village officials, and head-men, wherewith they might succour any starving wanderer found needing relief, give him a meal, and arrange to pass him on to the nearest poorhouse or relief camp. The sum spent in this way was small; but many stragglers were helped who might otherwise have perished by the way. Besides the regular relief there was thus a network of casual relief covering the whole country.

Relief for Cattle.

The preliminary preparations against the famine, devised in November 1896, included a careful estimate of the capabilities of the various State forests with the areas available for grazing and the number of cattle which each could support in a time of pressure. Though yielding a considerable amount of edible products, these reserves are chiefly useful in the way of affording fodder and pasturage for cattle in years of drought; and on this occasion there was not the excessive strain thrown on their supplies which might be expected in a great famine. When the abrupt termination of the rains in August 1896 destroyed the grain crops, it found the fodder crops well advanced. In fact a great deal of the crops sown for grain were eventually cut for fodder or grazed down. The winter rains revived and stimulated the wild herbage, and the many trees whose leaves furnish useful food for cattle did not generally suffer from drought. Thus, though the supply of dry and green fodder was defective and its price high, yet there was nowhere any complete failure, and in those distressed tracts where cattle were sold in large numbers they were usually sold in order to purchase food, and not because it had become impossible to support them. Though the urgency then was happily less pressing than it might conceivably have been, yet the resources of the State forests were fully utilized. The forests available for such purposes lie in two main blocks, the first and greatest in the submontane country along the foot

of the Himálayas; and the second, a comparatively small tract, in Bundelkhand. It has been mentioned that the latter tract was thrown open both for free grazing and for the collection of edible products by the people during the Bundelkhand famine in the summer of 1896. The pasturage was closed again when the rains seemed well established in August; only to be reopened later on. Proper conservancy requires that State forests should be held in reserve to carry the cattle over the last pinch, when home supplies have been exhausted and no spontaneous growth can be expected till the advent of the rains. Following this principle, the Bundelkhand forests were kept closed till there were signs that all available fodder supplies in villages were becoming exhausted. When this became apparent, the reserves were thrown open in April 1897 for free grazing and were fully utilized, though the scarcity of water rather than the scarcity of fodder placed a limit on their utility. In the sub-Himálayan tracts it was found sufficient to encourage, by exemption from fees and in other ways, the passage of herds through the belt of reserved forests into the great grazing grounds of Nepál, whose well-watered and lightly-timbered plains possess advantages for pasturage over the closely preserved tree jungles in British territory.

All restrictions on the extraction by the people of the spontaneous edible products of the forests were withdrawn when those products were ripe for consumption. The entire forests were thrown open for the free collection of such products, and were largely frequented for the purpose by the people of the surrounding tracts. They remained open till the 1st November 1897, when the autumn harvest had been secured.

CHAPTER VI.

Progress of famine and relief operations during the winter of 1896-97.

It will be remembered that when the rains ceased at the end of August, relief measures were being still carried on, though in a skeleton form, in some of the Bundelkhand districts and in the Hardoi district of Oudh. Early in September the growing pressure manifested itself by an increase in the number of applicants for relief not only in these districts but elsewhere; during the month of September relief calculated in units for one day was administered to 382,000 persons in nine districts. In October Collectors, acting on the instructions given them in the Government order of 21st September, found it desirable in many other places to begin test relief works. By the end of October distress had made itself manifest in a considerable part of Oudh, chiefly in the Lucknow division. In the Rohilkhand division every district was threatened with partial failure, and in Agra the country outside the canal-protected area had begun to need relief. In parts of the Benares and Gorakhpur districts there were forebodings of the scarcity which subsequently developed there, and test works had become necessary. The hill districts of Kumaun, enjoying good harvests, lay outside the sphere of possible distress, while the Meerut division and part of Agra sat secure in their network of canals.

When the situation was reviewed by this Government towards the end of November, famine had unmistakeably declared itself in several districts and was developing in others. In the Bundelkhand group of districts, as already stated, the distress of the preceding summer, though it had abated with the advent of the rains and the autumn sowings, had never entirely ceased, and relief measures had remained continuously in operation, though on a reduced scale. As early as the beginning of October poor-houses were open in all the Bundelkhand districts and in Lucknow and Hardoi; and Government had also directed that this precaution should be taken in all large towns where the pressure of prices on the very poor classes was beginning to show itself. In Bánda, Hamírpur, and Jalaun village relief was in operation, and in all districts of the group works were open and attracting a substantial number of labourers. At first these were in most instances conducted as test works, but before October closed they had been converted to the full Famine Code system in all except Jhánsi; while in the Rae Bareli district of Oudh a similar measure had become necessary. At the same time test works

had been opened in several districts of the Agra, Benares, Gorakhpur, Rohilkhand, Fyzabad, and Lucknow Divisions—16 in all—while the appearance of destitute wanderers had rendered it advisable to open poorhouses also in some of these districts. During November the development of distress was more rapid and general. Prices continued to rise, and the employment afforded in garnering the autumn and sowing the spring crops had commenced to fail. An increase in crime, the indications of an unsettled feeling, and a tendency to wander in search of employment, gave warning that in the more distressed tracts the time had come for an expansion of relief measures. Here and there, as on the Jasra road in South Allahabad, a sudden rush on relief works showed that in the most impoverished localities the people were beginning to get to the end of the scanty addition which the autumn harvest had made to their resources. These wants were met and preparations were steadily made to anticipate the growing demand. Work projects were matured, tools and plant provided, poorhouse accommodation increased, while relief circles were formed and the preparation of village lists of all persons who would, so far as could then be foreseen, require and be qualified to receive gratuitous relief at their own homes, was pushed on in all districts where famine seemed imminent. At the commencement of October the numbers in the daily receipt of all forms of relief were 15,000 in six districts. By the end of that month it had risen to 99,200 and had spread over 29 districts, of which six had been recognised officially as distressed. Of the total number relieved three-quarters were workers, while those gratuitously relieved might be roughly divided into rather less than one-fourth in poorhouses, rather more than one-fourteenth in receipt of home relief, and the remainder dependants of workers. As the causes at work became more potent, the distress grew both more widespread and acute, and the numbers on relief increased with corresponding rapidity. About the middle of November the failure of the late autumn crops became definitely declared, while the employment afforded in garnering them had considerably slackened; the construction of temporary wells, so largely stimulated by advances from Government, approached completion; the spring sowings were arrested for want of rain, and irrigation alone continued unabated for the occupation of agricultural labour. Prices continued to rise and the poorhouses were rapidly filling. Between the 14th and the 21st November the poorhouse population had risen from 7,200 to 19,000, and the later admissions in some parts showed signs of emaciation. Labourers and their families began to flock on the relief works in the more distressed districts, the sphere of gratuitous relief continued to expand, and a certain number of cultivating tenants, too, found it necessary to seek employment or to send the idle members of their families to the works. Finally, signs of distress began to appear amongst

the petty artizans, weavers, and the like whose occupation had ceased along with the prosperity of their customers.

The gravity of the situation at this time was clearly reflected in the prices current of food grains, which in the beginning of November rose to a phenomenal pitch, as shown by the following statement, which gives for the chief markets in the distressed area the amount of grain (in *seers* and *chhattaks*) purchaseable for one rupee, 1892 being taken as a normal year:—

District.	Wheat.		Barley.		Rice (common).		*Juár.*		Maize.		*Bájra.*	
	November 1892.	November 1896.	November 1892.	November 1896.	November 1892.	November 1896.	November 1892.	November 1896.	November 1892.	November 1896.	November 1892.	November 1896.

Fyzabad	13 4	8 0	18 12	9 8	15 0	9 1	...	10 8	25 0	11 4	18 0	...

These prices, which are on the whole double the ordinary rates, indicate not only the failure of the harvest, but the shortness of the stocks existing in the Provinces.

At this juncture, when the season for even the latest sowings for the ensuing spring harvest was rapidly passing away, a most unexpected fall of rain occurred.

The retreating monsoon appeared entirely exhausted, and a period had been reached when rain even under ordinary conditions is extremely unusual in these Provinces. During the last 50 years at Cawnpore rain was recorded in November only 4 times, only 5 times in Agra, and only 11 times at Allahabad. The normal rainfall in November for the Provinces generally is absolutely inconsiderable. Yet when all hope had been abandoned, a cyclonic storm which had crossed the Dekkan from the Bay of Bengal into the Arabian sea curved north-eastwards, and the Provinces were visited by a sudden and unexpected rainfall on the 22nd and 23rd November 1896. Its effects were thus described at the time:—

"All officers are agreed that the rainfall of the last week of November was too late to materially benefit such autumn crops as were still on the ground, except *arhar* (a species of pulse) and sugarcane; and also too late to enable spring sowings to be completed under ordinary conditions. They are equally agreed that in whatever locality the fall exceeded one-quarter of an inch the spring crops already sown were greatly benefited, and further sowings effected over an additional area. The peculiarity of the rainfall was its uneven and capricious distribution. In the Meerut division, which, owing to the canals and the good autumn harvest, was already beyond the risks of scarcity, the fall was generally good, varying in most districts from one-quarter to four-fifths of an inch. In this division consequently the spring area will be little short of the normal. In the

Rohilkhand division the average fall exceeded two-fifths of an inch, and was highly beneficial to the sandy tracts. In the Agra division rain was heaviest in the tracts which already were best off and lightest in the worst tracts. But its general effect was to change the situation in this division from one of very considerable gravity to one of distinct hope. Passing over into Oudh, the submontane districts are found to have received the heaviest rainfalls, the district of Bahraich, in particular, having so benefited thereby as to have brought 86 per cent. of the normal area under sowings. In Southern Oudh, comprising portions of both divisions (Fyzabad and Lucknow), the rainfall was slight; but the natural moisture of the soil and the humidity of the climate have done even more than was anticipated, and these advantages were supplemented by extraordinary resort on the part of the peasantry to the construction of temporary wells and to every form of irrigation. In the Gorakhpur division fairly good rain fell in the Basti district, placing it beyond the reach of crop failure, and in the northern part of the Gorakhpur district. The southern and part of the central portion of the latter district and the district of Azamgarh were practically untouched by the rain, and the tract had all along been regarded with considerable apprehension. But here also the natural qualities of the soil and climate have helped the cultivator, and two-thirds of the normal spring area have been sown. In the Benares division serious difficulties were not apprehended even in the absence of rain in November. Most of the districts received a fair amount of rain, and in the division as a whole nearly four-fifths of the normal area have been sown. There remains the Allahabad division, which from the first has been regarded by the Lieutenant-Governor as the weakest area in the Province. In these districts good rain fell in the greater part of Hamírpur and in part of Fatehpur, Cawnpore, and Jhánsi. Elsewhere it was too slight to materially improve the spring prospects. Bánda and Allahabad, in particular, were practically unaffected by the very light showers which they received. The result is seen in a spring crop which in the whole division is only 44 per cent. of the normal area, and falls to only 25 per cent. in Bánda against the November estimate of about 50 per cent. It may be doubted whether in Bánda more than 20 per cent. will yield a crop."

This rain, though too late to benefit the autumn harvest, was of immense advantage to the growing crops and added largely to the area of spring sowings. These later sown crops in the end turned out very poorly, and in the unfortunate districts of Bánda and Jalaun the fall was too light to allow any material addition. But generally the prospects were greatly improved. Prices steadied or slightly fell, and the people gained heart. With promising crops in the ground the inducements to wander were restricted and the area of prospective distress became curtailed. In Rohilkhand, Agra, parts of Oudh, Gorakhpur, and Benares the anxiety concerning the future was much relieved.

An immediate effect, however, of the rain was to restrict the irrigation work which had afforded much employment. Deprived of this occupation and pressed by high prices, the labouring classes continued to come in increasing numbers on the works or into the poorhouses.

The numbers on State relief had already included many of those who are dependent on private charity for their

support—a class ever the first to feel the pinch of famine. To this category belong not merely the professional mendicant who lives on the public, but also the many women, children, and aged or infirm men whom the custom of the country throws on the charity of their relations. From these classes were drawn the most troublesome persons who came within the scope of relief operations: those who cannot work and will not apply for assistance till reduced to the last stage of emaciation and weakness, and who will again resume their aimless wanderings when they have recovered strength enough to leave the poorhouse, to be again picked up on the roadside in the last stage of starvation and placed in the poorhouse infirmary; those who can work but will not, and who starve till qualified for admission to gratuitous relief, indoor or outdoor, and when restored to condition and drafted to works, abscond to repeat the process over again. It is such cases as these, the despair of the Relief Officer, which go to swell the mortality of the famine.

As the pressure of famine increased this circle of destitution grew wider, embracing not merely the usual recipients of private charity, but many who, givers in better times, now found themselves compelled to seek assistance. By the end of November the daily numbers on relief of all sorts had risen to 168,939 in 31 districts. At this stage nine districts had been formally recognised as famine-stricken, in 22 more test works were open or other precautionary measures of relief adopted. The workers now formed 66 per cent. of the total number relieved. Gratuitous relief had begun to assume larger proportions and was divided between dependants on works, poorhouse inmates, and home relief in the proportion, roughly, of 40, 40, and 20 per cent.

As December drew to its close the conditions existing in the previous month became intensified and developed. Home resources became more exhausted, field work more circumscribed, the circle of distress grew wider, and the numbers seeking relief continued to steadily increase. The poorhouse population was, in pursuance of the policy of Government, kept down by drafting the inmates to relief works as they became fit for labour or transferring them to the village lists where this measure was found suitable.

In some districts where the villagers, unaccustomed to relief measures, held off till the pressure of want became extreme, the condition of the people showed some signs of the privations they endured. This was confined generally to the lower castes and poorer classes. The ordinary diseases of the country, aggravated by the unusual cold and insufficient or unsuitable diet, began to show in a slightly enhanced death-rate in the districts which were the first to feel the pinch. But the mortality nowhere assumed large proportions, and the

general health and condition continued surprisingly good. The Inspector-General of Civil Hospitals noticed the condition of the people on the works at this time as an indication that the opening of this form of relief had not been unduly postponed. It was observed that where the newly-admitted labourers showed signs of privation, they soon gained strength and condition. The appearance of the children had not at this stage commenced to cause anxiety. Cases of emaciation were to be found in the poorhouse infirmaries, and here and there a wanderer, often from a foreign State or distant district, would arrive at the relief camp in a starved condition or be brought in by the police patrols in a dying state. Such cases, however, were rare.

It has been stated that in the earlier months a certain unsettled state of mind had been observed. It showed itself in a spirit of turbulence, in restlessness, and that inclination to wander which has been the traditional resource of a famine-stricken population. This had ceased now. The dispositions made to provide relief had convinced the people that the Government had undertaken their protection, and this conviction had inspired them with confidence. The assistance they had received in the shape of advances, while helping to this end, had enabled very many to sow their crops, to make wells for irrigating them, and so bound the cultivators to their homes. Henceforth the wanderers were stray casuals of the vagrant type or immigrants from Native States who, for some time, came in considerable numbers on our works. The popular movements were confined to those villagers who left their homes to seek employment on the nearest relief works. Many mendicants, who would not endure the restraint of poorhouse life, began to drift towards the western and northern districts where the good harvests gave them hope of finding charity still effective, and where they swelled the beggardom of the bazárs and taxed the patience as well as the resources of the charitable; but soon even this movement came to an end, and these mendicants settled down in the poorhouses. As the applicants for employment increased in number, the large public works on which they were recruited expanded and multiplied. A description of the staff and organization for carrying out these works will be found explained in detail later on. At times it was severely taxed to meet large and sudden demands made upon it. Precise instructions had been issued to all districts to prepare programmes of work, to complete the necessary plans for the selected projects, and to make arrangements for requisite staff and tools and plant. (The early order issued to the Jail Department to supply one million baskets for earth-carriers is an illustration of the magnitude of the transactions.) Famine is full of surprises, and the

policy was to make so far as possible timely provision to meet all contingencies. These preparations were pushed on everywhere and, it may be claimed, were found equal to the emergencies which arose. As an illustration of the difficulties which the Administration had to encounter, reference may again be made to South Allahabad, where towards the beginning of November distress unexpectedly assumed a very acute form, and a sudden rush of many thousand people to the relief works ensued. In a few days the gangs were organized and the works expanded for their reception, and settling down at once the hungry crowds became an effective body of controlled and organized labour, with no worse mishap than a small inefficient expenditure while the arrangements were getting into working order. This was at the outset when all was new and novel; but later on in the same district the relief workers and their dependants rose in one week from 33,000 to 83,000, the new recruits being absorbed on the existing works or other prearranged projects as fast as they presented themselves without any confusion or delay.

At this stage, it was deemed expedient to diverge from the principle of the Famine Code, which recommends that in the early stage of relief operations recourse should be widely had to small or village works and not to large works under the Public Works Department. In the Lieutenant-Governor's opinion large works under the control of trained Public Works Department officials were both more effective as tests and more susceptible of ready expansion to meet large and unforeseen demands. Later on it will be seen that the smaller class of village works became a more important feature in the relief system. In those districts where distress was less acute, and it was possible to exact a heavier task and desirable to impose a severer test, the system known as "Intermediate," which has been already alluded to and which will be described in detail hereafter, was adopted in order to secure these ends, and to prevent the relief works from attracting those who could subsist without them or could find employment elsewhere.

Relief works are necessarily open to all who are willing to submit to the prescribed tests. Village relief was administered with a more cautious liberality and did not expand so rapidly, although early in December discretion was given to Commissioners to commence distribution of this home relief wherever the clear necessity arose, without waiting for a formal declaration of the existence of famine. During December this form of relief was extended to nine more districts, raising the number to twelve. From that time forward it grew steadily in extent as distress deepened and as the Circle and Sub-Divisional Officers charged with the preparation of the lists realized the full meaning of the order of Government that "in districts declared to be distressed every

village should be treated with the view of accounting for each individual resident therein, and that no case which ought to be relieved should escape notice."

In the large cities measures had early in the season been taken by the local authorities to meet such cases. Very many of the respectable poor had been reduced to want or destitution by the pressure of prices and the failure of the private or domestic charity from which they usually obtained assistance. In numerous instances impoverished *parda-nashín* women, who are debarred by the custom of the country from appearing in public, had been accustomed to support themselves or eke out their resources by needle-work, embroidery, and similar occupations. The general pressure on the community had deprived them of this source of income, while their social position, age or sex prevented them from seeking relief in poorhouses or on works. The employment of many artizans, especially those engaged in the production of articles of luxury, had diminished or ceased. It became necessary to devise means for the support of all these distressed classes who presented numerous cases of a nature to excite pity and compassion. To this end private charity was locally organized, subscriptions were raised of a considerable amount from private persons and local bodies, and these were largely supplemented by Government grants. In Lucknow, which contains an unusually large number of impoverished or destitute persons of good family, the Government subvention amounted to Rs. 15,000 a month. In Benares and Allahabad the Government contributed Rs. 5,000 per mensem: and in Agra Rs. 2,500. Committees were formed, chiefly of native gentlemen under the presidency of their District Officers, and Sub-Committees appointed for the different quarters, consisting of those persons who, from their local knowledge, position, and influence, were best able to ensure the economical and honest distribution of the funds, and who could find out and relieve in a private manner, and with due consideration for their feelings, the many distressing cases of destitute people whose rank or pride led them to endure slow starvation rather than openly accept charity. In the cities and large towns ladies and gentlemen connected with various Christian Missions gave willing assistance. To those Committees the grateful acknowledgments of this Government are due for excellent services rendered in the discharge of their charitable undertakings. Later on this benevolent work was much helped by the subsidies received from the Indian Famine Charitable Relief Fund.

Prices had now ordinarily ceased to rise, but remained at a phenomenally high level and showed no signs of relaxing. Rain fell generally throughout the provinces in the Christmas week, and though it left some of the worst districts untouched and nowhere made any substantial addition to the area sown,

yet it was of great benefit to the growing crops and gave fresh confidence to the people. Still it did not affect prices. Imports went on briskly and large quantities of grain continued to find their way into the bad districts. In those tracts where distress prevailed the people had all along fully utilized the various wild products which could be used as food, and to this end, later on, the Government forests were thrown open for the gratuitous collection of edible fruit for human beings as well as fodder for cattle. Various roots, fruits, and edible grass seeds which the very poorest are accustomed to search out in their season, were this year collected by the unemployed members of families accustomed to better diet. The bramble bushes known as "ber" or "jharber" (*Zizyphus jujuba*) yielded an unusually large crop of its little plums, and the village children had this year to share them with their adult rivals. The young shoots of the gram vetch, always a favourite vegetable, were pulled to such an extent as to cause complaint that the outturn of the crop was seriously impaired. Aided by these adventitious resources the food supply showed no signs of exhaustion. The larger centres continued sufficiently, though perhaps not fully stocked. Here and there, in little outlying marts or village bazárs, there were apprehensions that supplies would run out. But private trade continued everywhere to meet all demands upon it, and the Government pursued steadily the policy of non-interference which gave that trade scope and confidence. In the one or two cases where the resources of private trade seemed overtaxed, the grant of assistance by Government to grain-dealers in the shape of recoverable advances met the difficulty. Wherever a relief work was opened, the petty trader at once appeared with his baskets of grain and condiments sufficient to supply all customers. This automatic provision of supplies relieved Government and its officials of much embarrassment and left them free to attend to the work of relief. The scale of wages on relief varied in direct ratio to the price of staple grains, and it was occasionally observed that the provision-dealers, taking advantage of this, combined to raise prices artificially, persuading the relief workers that their wages would be raised in proportion. Such combinations were met by encouraging larger dealers from the towns to establish branch shops on the works, and competition kept prices down to the market level.

Private trade, however, it may be said, was found to require little encouragement and less control. It wanted only security to be efficient. With famine prices prevailing grain-dealers in isolated positions are exposed to danger of plunder by mobs. Measures were adopted to check any such tendency among relief workers and protect the valuable agency which purveyed for them. The instructions to officers in charge of relief works provided that any case of plunder by workers

should be dealt with not as robberies or dakáities (which no doubt they technically were), requiring a lengthy procedure, but as theft, which admitted of being summarily tried and punished in the presence of the whole body of labourers. These instructions also provided for the immediate recoupment of his losses to the grain-dealer from fines imposed on all the gangs concerned. After a few cases of plunder of grain shops on relief works had been dealt with in this way, the trouble completely ceased: and so universally orderly were the relief workers that, as has already been stated, it was found unnecessary to increase the police force of the Provinces by a single constable to preserve order among them or to guard the treasure chest. Order was preserved through the people themselves.

Such were the conditions of distress and of relief which prevailed at the close of 1896. A very rapid expansion of numbers characterized the last fortnight of the year. The figures for the end of November have been given above; the opening of the new year saw 496,879 in receipt of relief. The great bulk of these were workers and their dependants, representing over four-fifths of the whole. Less than one-tenth were relieved in poorhouses and fewer still at their own homes. The area of distress now included 12 districts officially recognised as famine-stricken. Beyond them were 24 more, in which distress of a varying degree prevailed, and which were classed as still under observation. In all of these districts relief measures were in force in the shape of test works or poorhouses or village relief, or all three together.

The effects of the rainfall of November have already been fully stated. Though opportune and highly beneficial, it was not by itself sufficient to secure the crops then in the ground or being sown. The rainfall of the remaining cold weather months would have been sufficient to ensure crops which had been put out under favourable conditions. But it was inadequate for the wants of a harvest sown in a season of such deficient moisture that even the sowings were largely dependent on artificial irrigation, and all crops which were unirrigated suffered accordingly.

The Meerut, Benares, and Gorakhpur divisions came off best, and in most of the Oudh districts there was fair average rain. In all these tracts the winter rain of 1896-97 would have proved quite adequate under ordinary conditions. Elsewhere it may broadly speaking be said that the December and January rains were sufficient to secure the irrigated crops. But a general failure of rain in February and March combined with the effects of a high and continually west wind proved disastrous to unirrigated fields. The failure was most severe over the large waterless tracts south and west of the Jumna, and fell heavily on all the dry and poor soil in all parts.

The beginning of the year 1897 witnessed a steady development of the adverse influences already at work and of the measures taken to counteract them. The home resources of the people continued to grow more exhausted as each week passed, and as they failed, the numbers dependent on State relief continuously increased. On all sides there were signs that the pressure of scarcity and high prices was growing more intense and showing itself in the condition of the people. They poured upon the relief works in fresh crowds daily, they filled the poorhouses, and they swelled the lists of those gratuitously relieved at their own homes. A few figures will illustrate the rapid growth of the numbers who were thrown on Government for their support.

January opened with 410,238 people, workers and their dependants, on relief works, while 86,641 were in receipt of gratuitous relief in poorhouses or at their own homes. Week by week the numbers rose by 100,000 or 150,000 or even more. The average daily increment may be placed at 18,000. By the end of January the total on relief works had reached over a million. During February the recruitment went on at the rate of over 14,000 daily. When the accounts were made up on the 27th February, the total number on relief works was found to be 1,381,337, while 315,385 persons were in receipt of gratuitous relief in poorhouses or at their homes: the total was thus 1,696,722. That day was the flood mark of the famine.

The constant increase in the number of dependants showed that whole families were turning to the relief works for their support. In the worst tracts many villages began to present a half-deserted appearance in spite of the large expansion of village relief which tied many to their homes.

The poorhouse population rose steadily as the exhaustion of private charity drove the wandering beggars of the provinces, the waifs and strays of the bazárs and highways to, all unwillingly, fall back on this form of relief. By the end of January, when the provincial total had reached nearly 60,000, this field became exhausted and thenceforth the numbers began to slowly decline. In pursuance of the policy of Government those inmates who became capable of labour were constantly drafted off to the relief works, and those unfit for labour who had any fixed home were sent to their villages and placed on the free lists there. Death, too, helped to deplete their numbers. They included many suffering from chronic maladies and many who were picked up in the last stage of emaciation by the Relief Officers and police patrols. The reluctance of the vagrant classes to accept a settled residence and a subsistence diet led many to refrain from entering the poorhouse till starvation had induced

disease. Persons of this class would often, when they recovered a little strength, evade the mild compulsion exercised to retain them, leave the poorhouse, and wander aimlessly seeking in vain to beg a living till brought back again in a worse condition than before.

Village relief expanded during this period with great rapidity. The circle system already described had become fully elaborated. Village by village every individual was brought under observation, and as the famine grew in intensity new cases came constantly to light. As the able-bodied were forced to seek the relief works many of those dependant on them were left without support. Among the better classes who would not accept charity publicly many pitiable cases were sought out by the assistance of their neighbours and relieved in an unobtrusive way. The number supported gratuitously at their own homes, which at the beginning of January was little over 40,000, had risen to 233,000 by the end of that month; this total including persons to whom relief was temporarily given until they should become strong enough to earn their livelihood on the relief works. During February the careful scrutiny by European officers of the work done by their native subordinates had the effect of reducing the numbers on some of the village lists; but on the whole the work was found to be well done. In only one district were any serious defects discovered. By the end of February there were over 263,000 on the lists. Experience appeared to indicate that during the season when relief works are practicable on a large scale, when the numbers in receipt of all forms of gratuitous relief exceeded one-third of the number of labourers in works, and when the numbers on village relief exceeded 3 per cent. of the population of the distressed tract, suspicion is aroused and the need for closer scrutiny suggested. This rough working rule, the product of long experience of famine administration, was found useful as a danger-signal counselling special watchfulness.

Taking all forms of relief together, the numbers dependent on Government, which were 351,093 at the end of December, had risen to 1,305,217 by the end of January and by the end of February amounted to 1,696,722.

Besides the increase of numbers the signs of the times appeared in the character of the people who sought relief. In the worst districts men and women of the cultivating or tenant classes began to come on the works. They held out as long as their resources lasted, and in order to economize their means they and their families did a much larger share of the field work than usual, and so avoided the employment of hired labour (thereby limiting the employment available for day labourers, already restricted by the shortness of the cultivated

area). But at last many had to give in, and come on the relief works. Generally, however, it may be said that the labouring and artizan classes furnished the great bulk of the relief workers and that the cultivating classes only furnished a contingent from their poorest members.

The general rain which fell in the middle of January, while of immense benefit to the growing crops, put an end for the time to artificial irrigation and cut off this source of employment for the labouring classes, bringing them in larger numbers on the State relief. During January the districts of Agra, Etáwah, Mirzapur, and Bara Banki were officially recognised as distressed. In February Azamgarh and Fatehpur were added to the black list.

By the end of February the distress which prevailed was occasionally reflected in the condition not only of individuals, but even classes, of the community. Those who from motives of pride or indolence refrained from seeking the relief works or the poorhouse till no other resource was left, the wandering mendicants and the respectable poor on whom the dearness of provisions pressed heavily—such people showed in their appearance signs of the privations they had endured. It was noticed that the new applicants for employment or relief were often in an emaciated condition and compared unfavourably with those who had been prompter in seeking State support. In the earlier stages of the famine people were deterred from seeking or accepting relief from motives which lost force as time went on. Caste reasons were potent, and instances were brought to notice where money doles had been refused or actually returned by villagers because the recipient had been threatened with expulsion from the brotherhood. Grotesque reports were current among the people unaccustomed to such widespread bounty and ever anxious to discover some hidden motive for it. Rumour had it that everyone who accepted relief was to be subjected to demoniacal influences; or sent across the sea to labour islands or to people new countries which the *Sarkár* had conquered; or made to apostatize; or marked down for future sacrifices to the deities who are supposed to watch over the stability of great railway bridges. Instances, too, were not wanting of the struggle between natural affection and the love of life. A starving girl refused to take relief unless an undertaking were given that when she was sent away to the strange land, her old father should be cared for while alive and decently buried when dead. As time passed these absurd beliefs and restrictions wore themselves out. The people became familiarized with the system of State relief and ceased to look for any sinister motive. In the later stages of the famine persons who had refused proffered assistance came forward of themselves to claim it. The public faith was

again tried when very large sums from the Indian Famine Charitable Relief Fund were distributed for purchase of seed grain and plough-cattle, and again fresh rumours were spread assigning strange motives for the charity. The Amír of Kabul was coming to conquer India and the British Government was anxious to arouse a popular feeling in its own favour. A rich Bombay merchant with all his kith and kin had died of plague, and Government, to whom his property had come, had decided to spend it in charity. But this time the stories gained little credence, and did not prevent the whole village populations from flocking to share the bounty of the English-speaking public.

An increase in crime, chiefly of a petty nature, indicated the pressure on classes not usually criminal. Here and there a gang robbery or an incendiary fire showed that bolder spirits were abroad, and force had to be suppressed by force. The reports from border districts of the south and west began to show that the inhabitants of adjacent Native States had felt the pinch, and, leaving their houses, were crowding on the relief works or into the poorhouses of British districts. Rewah, Gwalior, and other States started works within their borders and for a time kept down the number of immigrants. But later in the hot weather the influx became so great that special measures had to be taken to return these foreigners to their own territories before the rains broke.

Early in 1897 the wet and cold, which was unusually severe, aggravated the sufferings of the people less able than in a year of plenty to withstand such adverse influences. Measures were taken to provide shelter and warm clothing for the most necessitous on the relief works; but fever, pneumonia, and bowel-complaints became prevalent, and the result appeared in a death-rate which, though nowhere startling, was in many districts sufficiently above normal to indicate the strength of the forces against which the people and the Government were striving. Though grain continued dear, yet subsidiary products, such as potatoes and carrots, began to come on the markets everywhere in large quantities towards the end of the month and made a valuable and cheap addition to the diet of the people. The effect of the regular support afforded by relief measures began to tell on the public health, and as warmer weather came after February the condition of the people began to steadily improve. In April the death-rate had fallen in the famine districts, and in May it was below normal for the provinces as a whole, though some of the most distressed districts showed a slight excess.

Prices during this period remained uniformly high, but there was nowhere any failure of food supply. Imports continued brisk and a great deal of Burma rice was introduced

into the Provinces. The total net imports, however, large as they were, would have gone but a short way towards feeding the entire Provinces. The local stocks still supplied the great bulk of the consumption, and there was a steady movement of grain towards the districts where scarcity was greatest and prices most stringent. This movement of trade will be considered more fully in the sequel; but it may be said that the market showed itself very sensitive: a favourable fall of rain would slightly cheapen grain for the moment, while the high west wind which blew for some days at the end of February materially raised prices throughout the Provinces.

The relief system in all its branches was now in thorough working order. As the demand for employment increased, the arrangements for the reception of labourers everywhere expanded. Fresh projects were matured and added to the existing programmes of relief works. Tools and plant were provided to replenish the existing stock and additional measures taken to provide sufficient supplies of copper coin and small silver to secure the punctual payment of wages. Private trade continued sufficient to provide food supplies everywhere, and it can scarcely be said that Government interference was ever necessary. In the distressed tracts every individual was brought under observation, and the village and city lists expanded to include all deserving cases. Poorhouse accommodation was where necessary increased, and the internal economy of these institutions placed on a uniform and orderly footing; the inmates themselves being employed to maintain order and perform the necessary domestic services. All Civil Officers absent on leave were recalled to duty, and when this resource was exhausted the superior staff was recruited by twenty Military officers who were employed both on the control of large relief works and in the civil relief administration, and rendered valuable services in both branches. Large additions were made to the subordinate district staff and that under the control of the Public Works Department. The village Circle Officers were doubled and trebled where occasion required. The medical staff was increased by the deputation of six European officers to special famine duty and a large staff of Assistant Surgeons, Hospital Assistants, and Compounders and Vaccinators appointed to take charge of the medical arrangements on relief works and in poorhouses.

Thus the object was secured which the Local Government had placed before itself, namely to establish a complete and expansive organization for the relief of distress which should be ready in advance of the demand and be capable of meeting at the shortest notice any contingencies which could be foreseen.

It was now clear that relief operations would be protracted through the hot weather and rains. Timely steps were therefore taken to erect shelter-houses for the staff at convenient centres where no accommodation at present existed. These temporary structures proved of great value later in the year, when camping in tents became all but intolerable.

CHAPTER VII.

The "rabi" or spring harvest of 1897: its extent and quality. The "Zaid" or Miscellaneous Crops.

It is now time to notice the character of the spring harvest which was gathered in March and April last, and to glance at the subsidiary or intermediate crops which intervened before the rains set in last June.

The climatic conditions under which the spring crop was sown and matured have been already fully stated. The average area of spring crops in the United Provinces is 20,413,755 acres, of which 31·8 per cent. is irrigated and 69·2 per cent. unirrigated. This year the total area fell to 14,786,410, a loss of 27½ per cent. But almost 53 per cent. of this area was irrigated, and in fact the actual area under irrigation rose by 1,305,075 acres, or 20 per cent. The entire loss was on the unirrigated lands—a circumstance which materially affects the outturn. The normal area irrigated from canals for this harvest is 1,100,000 acres. It rose this year to 1,844,000, an increase of 67 per cent. In addition 661,075 acres were irrigated from temporary wells and tanks, and represent the extraordinary efforts made by the people themselves to secure their crops. It has already been shown that this large addition to the protected area is chiefly due to the encouragement and pecuniary assistance afforded by the Government to the people in constructing temporary wells. Unfortunately, the protection afforded by this latter kind of irrigation was least in those districts which wanted it most, and where the failure in preceding harvests had been greatest. In these districts the water level is so low and the sub-soil so rocky that temporary wells could not be constructed. Ordinarily the food crops constitute 93·4 per cent. of the whole spring harvest. This year, though the sowings covered 72·4 per cent. of the normal area, the harvest yield did not exceed 60 per cent. of a normal outturn. The Meerut division came off best. Any slight decrease in the area sown was more than recovered in the enormous addition to its irrigation, which was nearly doubled. In the Agra division, as a whole, the crops were over 80 per cent. of the normal extent, the Agra district being the worst off, with only 62 per cent. In Rohilkhand the weak districts were Sháhjahánpur (61·18) and Pilibhít (64·20). The other districts were able to sow a fairly full area. In the Allahabad division the fluctuations are very great. The proportions per cent. to the normal area of each district stand thus:—

Cawnpore	... 85·62	Allahabad	... 44·36
Fatehpur	... 66·11	Jhánsi	... 45·70
Bánda	... 27·36	Jalaun	... 29·79
Hamirpur	... 49·07

Districts in which the crop was 66 per cent. or more of a normal crop,
Districts in which the crop was 50 per cent. or more of a normal crop, but below 66 per cent.,
Districts in which the crop was over 25 per cent. of a normal crop, but below 50 per cent.,
Districts in which the crop was 25 per cent. of a normal crop or below it,

In this division, therefore, the sowings for the spring harvest were more defective than elsewhere, and the deficiency was most marked in the country lying south of the Jumna, where the distress was already most felt, and the need for a favourable season was sorest. In Jalaun the Betwa Canal added substantially to the small irrigated area. But in the other Bundelkhand districts and South Allahabad the natural difficulty of artificial irrigation, aggravated by the drought, prevented that expansion of wet cultivation which ordinarily characterizes the Doáb districts. In the four Bundelkhand districts 78 per cent. of the total cultivation remained dependent on the natural rainfall for its crops. Later in the year this want of irrigation told sadly on the crops, which were sown in the hope that the favourable winter rain would bring them to maturity.

In the Benares Division a fairly good area was secured, Mirzapur being the worst district with 68·7 per cent. of the normal extent. In the Gorakhpur division the district of Gorakhpur failed to get more than 65·7 per cent. of its normal area sown. The other districts were better off.

In Oudh the spring crops were sown in rather less than three-fourths of the usual area. The Fyzabad division came off better than Lucknow, which only sowed an average of 68 per cent. The only serious deficiency was in the unfortunate district of Hardoi, which added to its previous troubles by getting little more than half the usual extent of its spring crops down: nor was the area sown even as well secured as usual, for the facilities for irrigation were impaired by the drought, and only 37 per cent. of the usual area was watered. Indeed, throughout Oudh generally, which is destitute of canals, the irrigated area fell off in marked contrast with the rise which occurred throughout the greater part of the North-Western Provinces. In the Fyzabad division the deficiency was only 7½ per cent.; in Lucknow it exceeded 17 per cent. The Kheri and Partábgarh districts alone showed any substantial increase.

The relative capacity of the two provinces—the North-Western Provinces and Oudh—to stand a drought is well illustrated by the experience of the present year. Usually Oudh has by 6 per cent. a larger proportion than the North-Western Provinces of its spring crops under irrigation. This season the conditions were reversed. While in the North-Western Provinces 56 per cent. of the crops were artificially watered, in Oudh only 43 per cent. were thus protected. The explanation lies in the extraordinary effectiveness of the Government canals in the North-Western Provinces during this drought.

In both Provinces alike the distress has been concentrated in those tracts where irrigation is most deficient.

Having thus stated the extent of the sowings, we have now to consider the outturn of the spring harvest. With favourable autumn rains the spring crops are to a surprising extent independent of winter rains. But in this year the complete failure of the autumn rains made the further rainfall a matter of much importance. In particular the late sowings effected at the end of November and beginning of December required the most favourable climatic conditions to yield successful results. The actual conditions fell short of the requirements. The character of the winter rains and their effect on the harvest in different divisions and districts were generally satisfactory, and things went well until the middle of February. The widespread rain in the Christmas week, and again at the end of January, came in time to save the staple cereals, and the crops at that time promised an average outturn in nearly all classes. But towards the end of February a high west wind set in and blew through a part of March.

Where the crops had been sown in time or had been irrigated it did little or no harm. But over the large area of late sowings and unirrigated lands it caused great injury. The backward crops on unirrigated land were over considerable areas parched up altogether and produced nothing. Where conditions were more favourable the plants then in ear were dried and the grain shrunk and lightened. A copious fall in February and March would have averted or mitigated the consequences of this untimely wind; but the rainfall of both months was meagre and below normal, and the outturn in all unirrigated lands was seriously impaired. Gram, usually the first crop sown, had to wait too long for rain, and except where irrigated gave a very poor yield. The considerable area of miscellaneous crops sown after the November and Christmas rains was largely unproductive.

Yet notwithstanding these drawbacks and losses, the spring harvest yielded an outturn very considerable in quantity and of extreme value in replenishing the depleted food supply of the Provinces. Looking at the extremely unfavourable conditions which prevailed at the seed time, and when the grain was ripening, the results proved as good as could have been expected. In the extensive irrigated area the crops were decidedly good. Wheat, which was comparatively largely sown, surpassed the highest recorded yield per acre. Barley turned out well, exceptionally well where irrigated, and was long the cheapest staple in the market. The pulses were good, particularly the Cajan pea *(arhar)*, which in some parts of the eastern districts is said to have flowered two or even three times and borne two or even three crops. Sugarcane was unequal. But though in some districts poor and below average, it was nowhere a decided failure, and in some parts it was distinctly good.

On the whole it may be said of the spring harvest that, notwithstanding the deficiency in area and the failure on unirrigated lands, the outturn for the Province generally was above one-half, and may be fairly placed at about 60 per cent. of a full average yield. In normal years the produce of the *rabi* or spring food grains in the North-Western Provinces and Oudh is estimated at 7,468,700 tons. In 1897 the outturn may be estimated at 4,431,700 tons. There was thus a deficiency of 3,037,000 tons, valued at normal prices at eighteen crores of rupees (equal to twelve millions sterling at current rates of exchange). Thus the failure in the autumn and spring harvests of food grains alone cost the Provinces no less than 34½ crores of rupees (equivalent to £23,000,000 sterling).

This calculation or quantification of loss is in substantial accordance with the estimates framed before the end of 1896. Unfortunately it is necessary to repeat that the area of greatest deficiency was the area of greatest need. In Bundelkhand and the south of Allahabad the unirrigated lands yielded little, in many cases nothing at all, and this loss was all the more severely felt from the scantiness of the protected area. In Hardoi a larger proportion of cultivation was irrigated than in Bundelkhand; but the failure of crops on the unprotected lands was almost as extensive. In the uplands of Mirzapur much the same conditions prevailed. Generally speaking, the spring harvest failed most where the autumn harvest had been worst, and chiefly for the same reason. Maps which accompany this narrative show at a glance the extent and distribution of the failure of both harvests.

Besides the ordinary field crops a certain area is always devoted to garden crops. In the present year this area was rather larger than usual. To some extent this was due to the action of Government in encouraging such cultivation and assisting it by collecting and distributing seed. As already stated the imported carrot seed generally arrived too late, and it is still doubtful whether it is suited to the conditions of village culture or to the climate of these Provinces. But the country carrot seed and much of the potato seed, which were distributed in considerable quantities, proved successful. The villagers were quick to take up the idea and sowed considerable quantities of these and other fast-growing vegetables, which made a valuable addition to the food supply in the later months of the cold weather, when the spring cereals had not yet matured. They were largely used, and they influenced the Famine Code rations on relief works, which are primarily framed on the basis of the more expensive cereals and pulses.

Besides garden cultivation there are certain extra products which contribute regularly to the food of the people at certain seasons. Water-nuts *(singhára)* proved a short crop, as might be expected in a year of drought. But the *mahua (Bassia latifolia)* yielded an excellent outturn, and it

was particularly good in the Bundelkhand districts and Fatehpur, where it is an important accessory, and gave valuable and timely aid, besides affording some employment to the weaker classes of workers in collecting it. Mangoes, on the other hand, proved a general failure, except in some parts of the Meerut division.

The extra hot weather *(zaid)* crops were largely sown and generally turned out well. The various sorts of pumpkin and melon gave a large yield, which helped out the food supply very usefully while it lasted. In the Hardoi district advances were offered to cultivators to grow *sáwan* (or summer rice). But throughout the greater part of the district the people are unaccustomed to this cultivation, and could not be persuaded to undertake it. In other districts, such as Bara Banki, where the tenantry were less apathetic, an unusually large area was sown with the best results. Generally speaking, the people exerted themselves manfully to obtain as large an outturn as possible of these intermediate crops, which mature during the hot weather. Where necessary, they were assisted by Government advances. The acreage under these supplementary or intermediate crops turned out 29 per cent. in excess of the normal area, and the produce was uniformly good. Besides the addition to the food supply, these crops, which require constant irrigation and tending, were useful in affording employment to a considerable number of labourers during the slack season.

CHAPTER VIII.

The hot weather and rains. Termination of the famine.

So far this narrative has been confined to the continuous development of the causes and influences which brought about the scarcity and to the establishment and expansion of the relief measures which these influences necessitated. The month of March which ushers in the Spring marks a new phase in the progress of events. The spring harvest after many vicissitudes began to reach maturity. With it the demand for field labour reopened: the food supply was replenished; and prices began to relax. In the eastern districts, where the crops ripen earliest, these effects were first apparent. Throughout the Provinces, generally, custom fixes the *Holi* festival as the date which marks the coming of the Spring time and the commencement of the spring harvest. This Oriental May-day is celebrated by the whole Hindu community as the occasion for friendly visits and mutual rejoicings. It fell this year on the 18th March, a date which might therefore be expected to see a very marked decrease in the numbers on relief works. The expectation was not disappointed. Between the 27th February and the 20th March over half a million of persons had left the works. The exodus continued uninterruptedly as the demand for harvest labour increased till the 10th April, when nearly 700,000 relief labourers had sought employment elsewhere. Even the poorhouses felt the influence, and many inmates departed to glean or beg a share in the new harvest. It was found possible also to make some temporary reduction in the numbers in receipt of outdoor relief. Altogether the total of persons supported at the expense of the State fell between 27th February and 10th April from 1,696,722 to under one million. The reduction was not spread equally over all districts. Where distress was most acute the fall was slightest: people were slow to go and quick to return. For instance in the Cawnpore district, where the pinch was not very severe and the spring crops turned out well, the number fell from 139,000 to 13,000. In Allahabad, where opposite conditions prevailed, between the same dates the number fell only from 214,000 to 192,000. In those districts, of which Bara Banki in Oudh may be quoted as an example, where the harvest was ample in quantity and quality, the famine practically ceased when the spring crops were garnered, though scarcity continued owing to the sustained high level of prices.

This change of condition necessitated some change in the policy of the relief administration. In the tracts, already suffering most severely, where a scanty harvest brought little

real relief, there was nothing to be done but continue the measures already in force, keeping up works on the Famine Code system and regulating wages by the sliding scale. The entire destitution of the people forbade any contraction of State relief till material improvement might be manifest.

But elsewhere the opportunity was seized to diminish and modify relief measures as the resources of the people improved. It was a matter of the first importance that labour required to get in the harvest should not be diverted from that object, and that no one should be retained on relief works who could find subsistence or employment elsewhere. To secure this end, measures were adopted to lower wages and make the labour test more stringent and thus clear the works of all whom circumstances did not compel to work for even the subsistence wage which the Famine Code provides. The scale of wages hitherto in force displayed some signs of now becoming unnecessarily liberal. Prices of grain showed a tendency to fall as the spring crops became assured, while the large supply of vegetables and other subsidiary articles of diet lowered the cost of subsistence. Accordingly a uniform scale of wages based on a market rate of 12 seers (24lb) of grain per rupee was introduced, tentatively at first, and extended in March to all districts where distress was not acute. Besides this a change of system became necessary in order to enforce a full task by applying the principle of piecework with payment by results which had been found suitable by experiment in selected localities. This system was known as "Intermediate" because it stood halfway between the ordinary contract system of public works and the system of task work under direct management prescribed by the Famine Code. The circumstances under which the Intermediate system was introduced and the results of the measure have already been referred to, and will be more fully shown in the sequel.

As the warm weather approached another serious danger threatened in parts of the country south of the Jumna. The water-supply showed signs of failing. The smaller streams dried up and wells in rocky soil began to run low. Besides the obvious inconvenience and danger of this failure it brought about conditions favourable to outbreaks of cholera. And cholera was not long in making its appearance. It first broke out with considerable violence in South Allahabad, where about 96,000 labourers had been concentrated for some time. The limited area of country in which suitable work projects and water-supply were available rendered it necessary to modify the entire arrangements then in force. In fact these conditions came into operation which have been referred to in Chapter V above as calling for the establishment of small relief works. The whole of South Allahabad was accordingly mapped out into circles, each of about 6 to 7 miles square, and a large number of minor works, each affording

accommodation for about 500 labourers, were opened, 6 to 10 such projects being located in each circle. The workpeople on the large works were broken up into bodies of 5,000 and marched to their allotted circles. Over these a further subdivision into bodies of 500 men was effected: and each such body told off to the nearest minor work. When all had been in this way dispersed, the individual labourers were then shifted, so that each was brought to a work in the neighbourhood of his own village, and had the advantage of being able to return home every evening after his day's task. There were no large standing camps to serve as a nidus for disease and as the people were, first of all, set to work to clean out and deepen their village wells, a sufficient supply of good water—the only sure preventive of cholera—was secured. The whole of this reorganization, affecting 96,000 people, was completed for the infected section in a fortnight. It had been first resolved to effect it in a week; but an expected fall in the temperature checked the cholera: and so permitted of more leisurely action. This celerity was only practicable because the people were well in hand, and because the danger had been foreseen and a large number of village projects selected beforehand to admit of rapid dispersion when the occasion arose. The scheme proved effective and very popular. It had the drawback of attracting larger numbers than would have sought the works under less favourable conditions, but very liberal measures of relief were required in this tract, where distress was very acute and widespread and the resources of the people abnormally depleted. The virulent epidemic cholera disappeared with the dispersion of the large bodies, and after that time recurred only in a mild and sporadic form. The people improved rapidly in physical condition, and when the rains commenced were able to begin field work with full vigour.

Precautionary arrangements were made in the other districts to follow the South Allahabad plan should a similar necessity arise. But though cholera appeared at intervals in nearly all the distressed districts, it was found possible by careful attention to sanitary arrangements to suppress each outbreak by segregating and dividing the labourers on the infected work only. This constant warfare against cholera was an anxious and trying duty, and some of the staff, both European and native, died in discharging it.

Of the three causes which, as pointed out above, co-operated to reduce the numbers on relief works in March, two—the commencement of the spring harvest and the occurrence of the Holi festival—were temporary in their effect, and though of universal application, varied much in force according to the deficiency of the harvest and the pressure of distress. In Bundelkhand, South Allahabad, and a few other localities

the scanty crops afforded very little and very brief employment for day-labourers. They attracted away from the works little more than the poorer cultivators and their families who had attended them. The pressure of want left few in a position for merry-making. The rough popular songs which are improvised and sung at the Holi festival took colour from the conditions of the year. Some that have been preserved, instead of the usual ribald license of the season, tell of famine and of high prices and of the relief that was extended to all classes.

The third cause was the measures taken by Government in the way of lowering the scale of wages, stiffening the task, and extending the Intermediate system. These measures were not applied, or were applied in a modified form, to the acutely distressed tracts. It is natural, therefore, to find that in such parts the falling off in numbers was less marked and less sustained. In the Hamírpur district indeed the numbers never fell off at all, but continued to steadily expand through March and April.

By the 10th of April the 1,300,000 people who swarmed in the works at the close of February had fallen to under 700,000. Moreover, they were confined to the true famine districts. In the merely scarcity districts very few remained on the works. The total number in receipt of relief in all forms on the 10th April was almost exactly one million. As the harvest work became exhausted the people began steadily to flow back to the works. By the 1st May the 700,000 on works had become 935,000; the total had grown by close on a quarter of a million. The increase was confined to the famine tracts, though here and there in the region of scarcity the demand for employment on relief works began to reassert itself. The process continued steadily through May in spite of the inclemency of the weather. The hot season had now set in and pressed heavily both on the labourers and the staff who had to carry on work through the burning heat and the fierce hot winds that often blow till far into the night. The hours of labour were adapted to the season, and shelter from the sun and wind was provided along the works where the people could seek refuge in the hours of midday when work was suspended. The strain was severe on the staff, European and native, compelled to be out at all times through this trying weather. It was observed that Europeans stood it better than the natives, many of whom broke down. The labouring population, accustomed to such conditions of life, maintained a high standard of health. In spite of occasional outbreaks of sporadic cholera the death-rate for the Provinces in both May and June was below normal. Even in the famine districts the public health was exceptionally good.

At the end of April the Lieutenant-Governor visited the districts of the Meerut Division and satisfied himself that

no relief measures were required in any of them. The very limited operations which had been carried on for some months in a small hill tract of the Dehra Dún district were closed early in April, when the spring crop had matured.

In the commencement of May conferences with the local officers were held afresh by the Lieutenant-Governor at the chief centres of distress. The dispositions for the hot weather were examined, the necessary arrangements made to strengthen the staff for the trying period then before them, and a forecast was framed of the wants and claims of each district till the tension should relax with the advent of the rains. Instructions were given to avoid the commencement of projects that could not be finished in time and, as the rains approached, to concentrate labour on the works which it was desirable to complete before the season rendered earth-work impracticable. Large suspensions of the land revenue instalment, then due, were sanctioned according to the necessities of each locality after examining the proposals of the local officers and the Board of Revenue. Thus equipped and provided, the Provinces entered on the penultimate stage of the struggle.

During May the numbers steadily grew, and at the close of the month they again exceeded a million-and-a-half. Agricultural work was in abeyance, and the people dependent on daily labour for their support continued to return till the second high water mark on relief works was reached on the 29th May, when the daily attendance on work was returned at 1,157,000. Of these only 22,000 were employed in the scarcity districts where the spring harvest had brought a degree of relief denied to the hardly-pressed famine tracts.

Gratuitous relief had slightly expanded as some of the feebler people, unable to stand the strains of work in the hot season, broke down and were brought on the free lists of their villages.

The numbers on relief works during May were swollen by the advent of many immigrants from adjacent Native States. Earlier in the season the presence of such foreigners on the relief works of several districts had been noticed. The numbers were not inconsiderable; yet, so long as this accession was confined to casual applicants or wanderers in search of employment or relief, no question had been raised. Relief works organized on the principles adopted in British districts had been opened in most of the principal States concerned, and the Political Officers of those States associated with the Darbár officials in their control. There was a natural tendency for persons near the border to seek the relief centres nearest to their homes, and in this way a certain number of British subjects may have also drifted into Native States. Following the principles laid down by the Famine

Commission in its report (paragraph 189), no effort at that time was made by this Government to discriminate these people or return them to the States to which they belonged. But about May it was observed that large bodies of villagers with their families were flocking to British relief works from States adjoining the Allahabad and Agra Divisions, and the numbers in some instances were so great as to seriously burden the organization on those works and to entail a heavy expense on the provincial finances. A census showed about 15,000 immigrants from Rewah on the works in South Allahabad and over 8,000 (chiefly from Gwalior) in the Jalaun district. Considerable numbers were also reported in Jhánsi, Mirzapur and Etáwah. It was ascertained that relief works under the general control of British officers were still maintained in their own territories for the reception of the inhabitants of these States concerned. The reasons assigned for the immigration were that more continuous employment, better arrangements for work, for payment of wages to labourers and their dependants and for food supply, rendered the British relief works more attractive. In one instance a large body of relief labourers marched *en masse* from a Native State into the Jhánsi district because they had ascertained that payments there were made in standard (British) coin and not in the depreciated currency employed in their own territory.

Communications were opened with the Political Officers of the States concerned, who at once organized measures to recall the immigrants; and as a preliminary measure it was decided in concert with them to stop the recruitment of all bodies of well-nourished workpeople from across the border while providing for the relief of stray wanderers and all persons in immediate need of assistance. By June all the organized parties of foreign labourers and their families had been received over by agents deputed for the purpose and returned to their own territories where suitable arrangements had been made for their employment. Shortly after this the advent of the rains and the measures adopted to meet the change of season led those who had remained to return to their homes.

The total number on relief of all forms on the 29th May was 1,543,888. From the beginning of June the attendance on works began to decrease. For the first fortnight the fall was slight. Here and there one or two members of a family would return home to look after the repairs of their houses as customary at this season and make their other little arrangements to prepare for the burst of the monsoon. But the bulk of the labourers awaited the opening of the rains. The 12th June found 1,096,000 still on the works.

Some local thunderstorms had brought showers in May; but the first twelve days of June were practically rainless. With the 13th June, however, commenced a series of

showers in nearly every district, light at first, but persisting and increasing in a way which soon left no doubt that the welcome monsoon had stolen in. The long-suffering districts of Bundelkhand and Allahabad were the first to receive a substantial fall on the 18th and 19th, which in Bánda displayed a true monsoon character.

The results on the relief workers were quick to appear and it was evident that a great exodus from the relief works to the fields was about to set in. The crisis synchronized with the Jubilee of Her Majesty the Queen-Empress; and advantage was taken of the coincidence to send the people to their homes with a memento of that auspicious event. Accordingly the 21st and 22nd June were declared holidays, and on Saturday, the 19th June, each individual of the 963,000 people on the relief works was paid three days wages in advance, in honour of the Jubilee of the great Mahárani under whose gracious auspices the abundant relief and charity of the preceding months had been dispensed to them. It would be too much to say that every one of those myriads who on the 19th June went to their long-deserted homes, rejoicing, realized what it all meant; but many understood it: while the rest in their ignorant minds did in some vague way associate this, to them, incomprehensible generosity of the *Sarkár* with the Queen's name. As at the same time the amnesty for prisoners, especially for female prisoners and for those who offended under pressure of want, restored to their homes some 9,000 people, it may truly be said that a bright ray of comfort was shed on many a home.

The effects of the break of the monsoon, assisted by the measures now described, were immediate and significant. Within one week the numbers on relief works fell by over half a million: on the 19th June the numbers stood at 963,000; on the 26th June they had fallen to 449,000 and on the 3rd of July to 415,000. Here, as in March, the natural results of the reopening of field work were assisted by the measures of Government. The paramount importance of securing a large area of well-tilled crops made it necessary to clear the relief works of every one who could find employment in the fields. To this end it was resolved to extend to all districts the Intermediate system which in the less distressed or "scarcity districts" had proved so useful in emptying the works at an earlier stage; to harden the scale of wages; and to introduce the less attractive forms of labour, such as quarrying and breaking road metal which had been held in reserve for the rains.

The relief measures which had been carried on patiently and steadily for the past eight months, and in Bundelkhand for over a year, since famine had first declared itself, now bore golden fruit. The peasantry had been maintained in

health and strength, and were ready, with almost unimpaired vigour and in undiminished numbers, to commence the tillage of the new crops whereon their fate depended. The resources of the Charitable Fund had been largely reserved to meet this crisis. By the splendid liberality of the English-speaking public over thirty lakhs of rupees were now distributed among the villagers to purchase seed grain and replace the plough-cattle which they had lost. This munificent charity was liberally supplemented by advances of State funds to small proprietors and cultivators of the better class. There were some apprehensions that seed grain might not be forthcoming in the parts where famine had been most prolonged. But seeing the people generally possessed of the means to pay for it, the traders quickly solved the problem of supply. Assisted and encouraged in these ways, the agricultural community turned with cheerfulness and resolution to the congenial task before them.

Had the monsoon progressed favourably, there can be little doubt that the great body of relief labourers would have melted away, and that by the middle of July only an insignificant number of the homeless and landless classes would have been found clinging to the works which had supported them so long. But the vicissitudes of the famine were not yet at an end. In the third week of June light but general showers fell for a few days in all districts. Up to this the rain had generally been sufficient for ploughing; but except in a few favoured localities not enough to generally admit sowing those staples like rice, which require abundant moisture.

But in the last week of June the rains ceased abruptly over the entire Provinces except in a few of the eastern districts, which continued for a few days to receive a fairly adequate supply. With the exception of a few scattered showers of no importance, this break continued up to the 12th July. The period was one of extreme anxiety, a dry west wind set in, and it appeared for a time that the hot weather conditions were about to reassert themselves. As the days passed without rain or even clouds, reports began to come in from nearly all districts that agricultural operations were suspended, that the seedling crops were drying up, or that seed had failed to germinate. Artificial irrigation became necessary in upland places. At this crisis many of the tanks which had been excavated as relief works during the past seasons and had partly filled with the first showers yielded their first fruits by affording water for the thirsty fields around them. Prices, which showed a tendency to fall when the June rains appeared favourable, began to rise again. A feeling of apprehension and disquietude commenced to spread among the people, who feared lest the failure of the previous year might be repeated in this monsoon. They began to return to the abandoned relief works and re-enter the poorhouses. By the 10th July the number on works had risen to

536,000, and the total number of persons in receipt of relief of all forms was over 1,000,000. It became necessary to arrest the new dispositions that had been ordered to meet the change of season and to revert to the Code system of works in districts where the more stringent Intermediate system had recently been introduced. The Meerut Division, protected by its canals, and the Benares Division, which received the remnants of a current that brought copious rain to the neighbouring province of Bengal, alone maintained their position of safety. Elsewhere the tension had become extreme, and there were even gloomy estimates of mischief done which could not be retrieved. The situation had become so critical that the Lieutenant-Governor undertook another tour of the Provinces, to concert measures to meet this fresh emergency. He had scarcely started when, on the 12th July, the long-expected rain descended over practically the entire country.

Ploughing and sowing were resumed with great activity, and it was soon ascertained that but little substantial harm had been done. A few more days of drought would have proved ruinous; but the rain revived the crops, and in the few fields where seeds or seedlings had perished they were soon replaced by fresh sowings. It may in anticipation be here said that the area sown was 3·3 per cent. above the normal: and that practically the crops have been uniformly excellent.

Prices began to fall, and the 31st July saw a distinct drop in the rates for coarser grains, though the finer staples remained as dear as before.

During the tour which the Lieutenant-Governor made in July the whole relief arrangements were again reconsidered, at the chief centres of distress, in conference with the local officers. Such readjustments as the circumstances of time and place called for were sanctioned: and a plan laid down for winding up the relief system when the early autumn crops should have ripened. To this plan, further reference will be presently made: here it may be conveniently mentioned that the rearrangement of relief works which had been arrested in some localities when the break of the rains set in was again undertaken, and before the end of July the Code system of works had ceased in all districts. Some difficulty was experienced in devising works suitable for unskilled labour which could be carried on during the rainy season. Tank excavation and indeed earthwork generally became impossible, and consequently all the great relief works had to be closed. In the country south of the Jumna, where stone abounds, quarries were opened and numbers of labourers were employed in quarrying and breaking road metal. In other districts where the nodules of impure limestone known as "*kankar*" are largely used for road metal the work of digging, cleaning, and stacking them was started. Gangs were also employed in finishing

off unmetalled road embankments which had been constructed during the previous months and in repairing embankments which had settled when soaked with rain. In a few localities relief labour was utilized in levelling and clearing the sites of old forts or habitations either for sanitary purposes or to render them culturable and to obtain the bricks which have a marketable value. In these ways sufficient employment was found for those who still required it. But the demand for employment soon ceased. The labouring population flocked back to the fields where they found more congenial and profitable employment than that which the relief works offered. By the end of July the number of persons supported on relief works had fallen to under 100,000, and the bulk of them were confined to five or six districts. This number sank steadily through August as field work expanded; early in September it was only about 15,000, and on the 15th September the last of the relief works was closed.

The further progress of the rains may be briefly told. They continued in an unusually favourable manner. There was sufficient open weather in late July and early August to admit the sowing of all crops and sufficient showers to bring them on. Later on the heavy rain was favourable to the transplantation and growth of the late rice—a very important crop. In some of the Bundelkhand tracts this heavy and continuous rain checked weeding, and thereby curtailed the employment of agricultural labour—a difficulty which involved the extension of gratuitous relief for the time: there were some complaints, as might be expected, of injury to crops in lowlying lands, and floods did some mischief in river valleys. But taken as a whole the Provinces could not have wished for more favourable conditions than prevailed. At the end of August and beginning of September, when fine weather was needed for the ripening and harvesting of the early staples, the continuous rain was succeeded by sunny and showery weather which brought into the threshing-floors a harvest that left little to be desired.

The penultimate stage of the Famine had been reached by the closure of the great relief works. But the measure deprived of their support a large number of persons who had been maintained on the works as dependants. Besides these a certain proportion of inefficient labourers who, driven from the works by the rain, returned home with their families were unable for a time to get work in the fields, and the high prices which still prevailed left the earners little margin for the support of others. For these people a period of severe pressure ensued until the expansion of agricultural employment and the maturity of the early crops brought relaxation. An increase of the gratuitous village relief at this period was therefore necessary: it had been anticipated, and measures to meet the temporary strain were in readiness.

This strain on the gratuitous relief system, which began in June with the advent of the monsoon, continued to increase till, on the 24th July, it reached its maximum with 424,000 persons on outdoor relief and 45,000 inmates in poorhouses. After that date the numbers began to fall off in the less distressed districts as prospects of a good harvest became brighter: and employment in weeding and other agricultural occupations became available. But in the true famine regions, where the largest numbers were in receipt of relief, the pressure was slower to relax and the fall in numbers was more gradual. The end of August still saw 400,000 people on outdoor relief and 34,000 people in poorhouses.

The time had now come to put in force the plan for gradually winding up relief measures, which, as stated above, had been predetermined at the conferences of July. This plan will be best understood by quoting in this place the Government orders in which it was prescribed for general adoption. The orders, which bear date 4th of August, are as follow:—

"The Lieutenant-Governor and Chief Commissioner has now visited the chief centres of distress in the Provinces, and has concerted with the Divisional and District Officers the measures which have been rendered necessary by the advent of the rains, and the policy which should be pursued, and the further measures which should be adopted, to finally wind up relief operations, provided the rains continue favourable for the remainder of the season. The results of these deliberations are embodied in the notes of conferences which accompany this letter.

"In many districts relief works have been already closed, and in all they have been substantially reduced. The remaining works have been concentrated at as small a number of centres as possible, and works, such as stone and *kankar* quarrying which can be carried on during the rains, have been, so far as possible, substituted for the various forms of earthwork hitherto in operation. The Famine Code system of works has been everywhere abandoned, and the Intermediate system with full tasks introduced and the rates fixed at either the 12-seer or the 14-seer scale. Field work of various sorts has opened up with the progress of the rains, and in nearly every locality affords occupation for all the labour seeking employment. It is anticipated that all the works will be gradually deserted, and that few will remain open by the end of August. The early *kharif* crops may be expected to be ripe and coming into consumption by the 15th September, and the last of these Department of Public Works relief works must be finally closed on that date, and the labourers, if any remain, left to find employment in the usual pursuits which will then be open to them.

"Poorhouses will remain open for the present for the reception of wanderers and of persons unable to labour. As already directed, poorhouse inmates who are able to work should be required to execute a suitable task, and work should be devised and provided for this purpose.

"From the end of August or beginning of September steps should be taken to draft back from the poorhouses to their homes, and bring on the village lists, all persons unable to support themselves who have any fixed residence or whose village of origin can be discovered, excepting only those hospital patients who from illness are unable to travel. This

operation should be completed by the 15th or 20th September, and after that further admissions to the poorhouses should be refused, except in cases of obvious necessity. When the village relief is finally closed in any district, any remaining inmates of poorhouses must be paid off with a fortnight's subsistence dole, and be warned that they must thenceforth provide for themselves as they have been accustomed to do. Infirmary patients must be removed to the permanent district hospital or permanent poorhouse where such institution exists. The poorhouse will then be finally closed and the establishment dismissed.

"It remains to deal with persons in receipt of gratuitous relief in villages and cities (Chapters V and X, Famine Code). Commencing from the end of August, the lists should be carefully revised and superfluous names weeded out. These operations should be supervised, where possible, by European agency: at the same time, if prices have fallen, the rates may be reduced under orders of the Commissioner of the division.

"The next step will be to strike off whole villages from the relief lists. This process will begin when the early *kharif* is ripe and the new grain in the market. In some places this will take place early in September; in some places by the middle of that month; in some places perhaps later. In a few localities where the early *kharif* is inconsiderable and the harvest consists almost exclusively of the later staples, it may be necessary in special cases to retain villages on the lists as late as the middle of October. The decision of such cases is left to the discretion of Commissioners.

"Those tracts will be selected for reduction first where the *kharif* is earliest, but it should be complete for every village with an early *kharif* crop by the end of September. If in any village, owing to backwardness of crops or great preponderance of the later *kharif*, it is necessary to postpone final closure, the list can be maintained till the middle of October. But if the rains progress favourably, such cases should be exceptional. As each village is struck off, the recipients then on the list should receive a week's or a fortnight's dole at the Collector's discretion, and be warned that they must thenceforth provide for themselves. In this way the relief will carry on the recipients in some cases to the beginning of October, in most cases to the middle of that month, and in exceptional instances to the commencement of November. As the villages are struck off, relief measures will be finally wound up and the special establishments reduced.

"In cities relief, as a rule, will be closed at the end of September, the recipients then on the lists being paid off with a week's or a fortnight's dole. City relief committees should be given timely information.

"The arrangements above described will, His Honor believes, provide for the gradual reduction, and the final closure of relief in the manner calculated to cause the least suffering or inconvenience to those now dependent on State support, and I am to request that they may everywhere be followed, unless sanction is sought for any modification in any special case.

"It is impossible to expect that where people have for a considerable period been accustomed to receive gratuitous support at their own homes or in poorhouses, the discontinuance of such support can be effected without inconvenience and a certain degree of hardship to those who are again thrown on their own resources. The longer the relief is continued the greater this difficulty will become, and the Lieutenant-Governor and Chief Commissioner believes that in the end the most humane as well as the wisest course is to terminate at the earliest possible moment, after the ripening of the *kharif* harvest, of which the promise is now excellent;

arrangements which cannot possibly be maintained in permanence. There is much danger that the continuance of State relief, after the imperative necessity for it had ceased, would tend to weaken the custom and the immemorial duty of private and domestic charity which has been up to the present the resource of the destitute and helpless. It is of the first importance that no impediment should be placed in the way of the return of the community to its old customs and habits of life. Any unnecessary postponement would in the end prove an injury to the classes it aimed at assisting.

"In this way the Lieutenant-Governor trusts that relief operations of every kind may be brought to a close on the 15th October at latest."

It will be perceived that the plan of operations is based on the fact that in the various portions of these Provinces the harvest is not simultaneous, that it is earlier in some regions than in others, and that some food grains ripen sooner than others do. The earliest *kharíf* grains ripen in the end of August or beginning of September, and it was therefore agreed upon that from the beginning of September the village gratuitous relief lists should be subjected to a scrutiny, and all those who obviously could be left to their own resources or the care of their friends should be then struck off. But it was recognised that the work would be indefinitely prolonged if this procedure were alone to be relied on and individuals always dealt with. It was essential that this kind of relief, which is demoralizing where not absolutely necessary, should be terminated at the earliest safe moment.

The ripening of the crops in the village gave an assurance that the safe moment had arrived and that no evil would result from dealing with the village as a whole. It was therefore decided to operate on the whole village and to strike off the lists all recipients of gratuitous relief in a village in which the crops had matured. This procedure was adopted from the middle of September progressively in all these villages where the early crops were extensive and successful. In these villages where there was a preponderance of the *kharíf* food grains, which ripen later, relief was prolonged. But in no case was it found necessary to retain the system of gratuitous village relief beyond the 15th of October.

And a further precaution was taken by way of additional assurance that the transition from the State relief to the ordinary habits of village life should not cause distress. This consisted, as stated in the orders, in giving to all recipients of gratuitous outdoor relief a dole sufficient for a week or oftener a fortnight's subsistence. In this way the dependence of the past gradually merged in the freedom of the future.

In regard to poorhouse relief, the object was, as will have been noticed, to assimilate the method of winding it up with the method of winding up village relief. In this way complications were avoided, while every poorhouse inmate was

placed in his or her village of origin and, as far as possible, in the position he or she occupied 12 months before.

The favourable progress of the harvest rendered it possible to adhere to this scheme with reasonable closeness. By the middle of September the numbers on the Government outdoor relief lists had fallen to about 231,000, while the poorhouse population had fallen to under 11,000, and many of these institutions had been closed. By the 1st October the corresponding numbers were 115,587 and 5,017. On the 20th October the Lieutenant-Governor was able to inform His Excellency the Viceroy that the relief operations had been practically closed on the 15th idem, by the distribution of the authorized parting dole, and that there remained as a charge on the Government only a few hundred infirmary patients and about 2,000 orphans. The very paucity of the number of orphans and waifs and strays in comparison with the magnitude of the year's operations, is in itself testimony to the success of the relief arrangements.

From the beginning it was expected that orphans would come on the hands of Government, and accordingly in December 1896 the following orders were issued prescribing the method of dealing with them:—

"In the poorhouse at the headquarters of each district a section should be reserved for orphans, male children being kept separate from female children if over 10 years of age. A respectable matron should be appointed to the charge of the orphanage on suitable pay, and should live in the orphanage. Inquiries for the parents or friends of the children should be instituted immediately the children are found to be deserted and if the parents or friends are discovered, the children should be made over to them, the parents or friends being helped, if indigent, under the general system of the Famine Code. If the friends or parents are not discovered, and especially if there is reason to think that the parents are dead, the children may be disposed of in accordance with the provisions of article 130 of the Famine Code. Special care should be taken that in no instance is a Hindu child made over to a Muhammadan, or a Muhammadan child to a Hindu. Special care should also be taken with regard to female children, so that the danger of their getting into the hands of prostitutes may be avoided. The person to whom a child is thus made over should be placed under obligation to account for the child at any time until the child attains the age of 18 years. Before the children are thus given over for adoption, a sufficiently long period should be allowed to elapse, within which search will be made for the children's parents or friends. The search should include a careful local inquiry in the village which the children may name as their home, and every obtainable clue must be followed up. In each case a written proceeding, stating the steps taken to trace the parents or friends, should be drawn up and recorded before a child is given over for adoption.

"A certain number of children will probably remain over in the orphanages after efforts to find the parents or relatives have been exhausted and after the option of adoption has been allowed to their co-religionists. The balance thus remaining over may be treated under article 131 of the Famine Code, the orphanages being chosen by reason of their known reputation as homes for deserted children."

The number of children now remaining in the district orphanages is 1,668. No doubt most of these are true orphans, but some have probably been merely deserted by their parents. Efforts have been, and are still being, made to trace out their parents or friends. These efforts have in some cases been rewarded with success, and the children have been restored to their homes. In other cases there has not been success. If further efforts are unsuccessful, and if it is found impossible to induce respectable people of the same caste and religion, over whom the Local Government can exercise supervision, to adopt the children, they will be placed in orphanages controlled by the Bishops of the various Christian communities or in respectable orphanages controlled by substantial native Societies and Committees. It is understood that the Provincial Branch of the Indian Charitable Relief Fund intends to endow the various orphanages for the maintenance and education of these children. In any case this Government intends to exercise a control and supervision over the orphanages, in the interests of the children, until they attain an age when they may be trusted to take care of themselves.

CHAPTER IX.

Operations of the Department of Public Works.

ARTICLE 17 of the Provincial Famine Code declares it to be "the duty of the Chief Engineer in charge of the Public Works Department, Buildings and Roads Branch, in communication with Commissioners and District authorities, to maintain for each division and district, under the sanction of Government, a programme of all relief works, and to see that for each work there is a project in such detail as is suitable to the class of the work." The occurrence of famine in Bundelkhand in 1896 had drawn the attention of Government to the necessity of bringing this programme up to date; and measures to this end had already been taken when the imminence of a second and much greater famine accentuated the necessity for special despatch in completing them. Accordingly, on the 21st September, the attention of the officers concerned was drawn to the urgent necessity for completing the revision of the programme of works, and expanding it for all threatened districts. On the 2nd October minute and detailed instructions were issued to secure complete preparation upon all points necessary for the efficient management of relief works. The probable scale of establishment required for each district and charge was indicated, and sanction given to the recruitment of additional overseers, work agents, and cashiers. A beginning was made in providing tools and plant, and arrangements for expanding the establishment of administrative officers and providing an adequate medical staff were matured. With a view to assisting officers unaccustomed to famine work, the system of relief management followed in Bundelkhand in the previous months was summarized for general information in a Resolution recorded by the Lieutenant-Governor on the 20th October, the points which the experience of that period had shown to be of the greatest importance being brought to prominent notice. The most important and permanently interesting of these were—

I.—The paramount importance of the principle that preparations should be well in advance of pressure. Preparations were not to be confined merely to the selection of projects, but should include all arrangements for beginning active work at a moment's notice when the time for action should have arrived.

II.—The necessity of enforcing task work in tracts most acutely distressed.

III.—The desirability of selecting works with a long *lead*, as it was anticipated that the number of carriers would be much in excess of the proportionate number of able-bodied diggers.

IV.—The enforcement of precautions against fraud.

V.—The necessity of special sanitary arrangements, and, in particular, of a pure supply of drinking water.

VI.—The provision of a large supply of copper coin for payment of wages.

The revision of the programmes of relief works was completed by the end of October 1896, and these programmes were subsequently considered and approved at the conferences which the Lieutenant-Governor held during his first tour in November. They provided employment for 277,650,000 persons for one day or for a daily average of about one million persons for nine months in all districts of the North-Western Provinces and Oudh, except the Meerut and Kumaun Divisions. In those districts in which it transpired at the conferences that the impending famine promised to be exceptionally severe, steps were taken to prepare additional projects as a precautionary measure. In some localities it was difficult to arrange for sufficiently large works, and in other localities there sometimes was a serious deficiency of drinking water-supply, which, besides adding substantially to the cost of the work, rendered it undesirable to assemble large bodies of people there. Otherwise there was no difficulty in finding suitable projects of work.

Subject to the control of the Commissioner of the division in all non-professional matters within his jurisdiction and of the District Collector within his lesser sphere of authority, the burden of carrying on the relief works fell on the ordinary staff of the Buildings and Roads Branch of the Provincial Public Works Department. It is desirable, therefore, to state here very briefly how this Branch is organized. The organization being local rather than provincial, the territorial unit of administration is the district. Each district has its District Engineer, who may belong either to the superior Departmental or to the Upper Subordinate establishment. But whatever his Departmental status may be, his functions are the same: he renders his accounts, not to the Examiner of Public Works Accounts, but to the Divisional Engineer, and he is, within the limits of the budget estimates and according to his experience, allowed considerable freedom of action, though always under the control in all non-professional matters of the Collector-Magistrate of the District and the District Board. On the 1st of October there were, excluding the Kumaun and Meerut divisions, in which the scarcity was not severe enough to call for relief works, 20 District Engineers

and 20 District Surveyors employed in the North-Western Provinces and Oudh; and of these 40 officers, one-half were Europeans and one-half Natives of India.

For purposes of fiscal and general administration the districts are, it has already been said, grouped into divisions: the Public Works system follows this grouping. Each fiscal division forms also a Public Works divisional charge under an Executive Engineer, with the exception of the Allahabad division, which, being very extensive, is divided into two charges, designated respectively the 1st and the 2nd Allahabad divisions. The 2nd Allahabad division comprises Bundelkhand, in which the famine both in 1896 and 1897 was most severe. The Divisional Engineer, who is subordinate to, and maintains direct communication with, the Superintending Engineer on professional points and the Commissioner of the Division on general administrative and financial business, is the responsible executive officer by whom the District Engineers are controlled; and all accounts are compiled and submitted to the Examiner of accounts. Finally, the various Commissionerships are grouped into three Public Works Circles as follows:—

Agra	Division	...	...	1st Circle.
Meerut	ditto	...	...	
Rohilkhand	ditto	...	...	
Lucknow	ditto	...	...	2nd Circle.
Fyzabad	ditto	...	...	
Kumaun	ditto	...	...	
Allahabad	ditto	...	...	3rd Circle.
Benares	ditto	...	...	
Gorakhpur	ditto	...	...	

Over each of these circles there is a Superintending Engineer, to whom the Divisional Engineers are subordinate. These Superintending Engineers have no concern with the preparation or submission of accounts, but are solely directing and inspecting officers. It may, the Lieutenant-Governor thinks, be questioned whether, for ordinary administrative purposes, this chain of authority and subordination is not too expensive; but for the purpose of famine administration, which imposes an intense strain, the organization proved by no means too strong.

Indeed, it was found necessary to divide the 3rd Circle into two, the famine relief works in the Allahabad fiscal division being placed under Mr. C. G. Palmer as Superintendent of Relief Works, while the relief works in the Benares and Gorakhpur fiscal divisions, together with all ordinary works in the circle, remained under the Superintending Engineer.

It may here be remarked that ordinary works, so far as not deferred owing to financial pressure, were carried on as usual during the famine.

In addition to the Divisional and District Officers, there were in the famine districts when preparation for relief works began 26 Upper and 77 Lower Subordinates; but many of these—the former especially—were required for ordinary works. As this staff, which was not more than sufficient for ordinary times, was altogether inadequate to meet the pressure which threatened, the necessary steps to strengthen it were taken early in October, by the recruitment on special conditions from outside the Government establishments, of 33 Visiting Inspectors and 652 work agents (who answered to Upper and Lower Subordinates). There was at the time of the greatest pressure considerable difficulty in obtaining efficient men of these classes in sufficient numbers; but, owing to the energy and good-will with which the controlling officers worked, the difficulties were overcome.

The non-commissioned grades, so to speak, of the Public Works Department were sufficiently strengthened and recruited in the way now mentioned; but the highly important work remained of strengthening the Commissioned and controlling ranks, whereby the interests of the State on the one hand and of the recipients of relief on the other could alone be adequately safeguarded. The Irrigation Branch could spare only two officers, and the Lieutenant-Governor in this emergency resolved to ask the Government of India for the services of military officers to assist the departmental officers in the control and management of relief works. Eventually, through the good offices of His Excellency the Commander-in-Chief of the Forces, the services of 8 officers of Royal Engineers and 12 Staff Corps officers were obtained. Instructions were issued for the guidance of these officers, their chief duty being to ascertain and note all deviations from rules and orders, to correct all such deviations on the spot and at once, and to assure themselves, at each inspection of the relief works under their supervision, that no more money was being spent than was necessary, that the expenditure was being properly accounted for, that relief was being adequately administered, and works conducted in a proper, orderly, and methodical manner. Latterly, they were placed in actual charge of a portion of the district. When so employed all reports and returns, except those in regard to purely account matters, were submitted to them by "officers in charge," and so far as regards the management and organization of the relief works, they to a large extent took the place of the District Engineer, who was thus relieved of much correspondence. Of the value of the services of the military officers the Lieutenant-Governor cannot speak too highly. The efficient management of these relief charges, through all difficulties of season and sickness, was greatly due to them. They soon grasped the situation, which must have been entirely novel to most of them, adapted themselves to the circumstances,

and in activity, zeal, watchfulness of the interests of the Government, and humanity towards the people left nothing to be desired. The Lieutenant-Governor desires to acknowledge the great obligation under which they have placed this Government.

At an early date special provision was made for the punctual preparation of the accounts. The Government of India, responding to an appeal from this Government, deputed some senior officers for the purpose, and aid was also procured from the Irrigation Branch of the Public Works Department. Extra clerks were engaged, and the divisional accounts were gradually brought up to a fair standard of punctuality. To illustrate the extraordinary pressure thrown on the accounting staff, it may be mentioned that the ordinary yearly expenditure in the Buildings and Roads Branch of the Public Works Department in the North-Western Provinces and Oudh on works and repairs is about 39 lakhs of rupees, whilst between October 1896 and September 1897 over 134 lakhs were expended on famine works, exclusive of tools and plant and establishment.

From the beginning and subject to the paramount duty of saving life the chief objects aimed at by the Executive officers were, *first*, the exaction of a fair task; and *secondly*, the securing of the punctual payment of the wages earned. A suitable return for the wages paid was invariably insisted on unless the recipient was altogether unfit to labour. A task, light at first in the case of weak persons, was prescribed and, after warnings, enforced by a system of fines first on the digger and, if that did not prove to be effectual, on the carriers also. Recourse might also be had to a penal ration of cooked food or, in extreme cases of recusancy or malingering, to removal to a workhouse. In regard to payments of wages it was found, during the Bundelkhand famine of 1896, that payments twice or three times a week to the labourers were more convenient for all concerned than daily payments. But in 1897 daily payments were preferred. The reason is that in 1896 the numbers on relief were comparatively few: they worked nearer their homes; the grain-dealers knew them better; and their credit was not altogether exhausted. Moreover in 1896 a large staff of trained Public Works subordinates was available for employment within a limited area: and upon the honesty of this staff reliance could be placed. In 1897 the permanent departmental staff went but a small way to supply the necessary control: temporary men were engaged regarding whose probity there was not the same assurance: the vastly increased numbers on relief prevented the grain-dealers from giving credit to individuals whom they did not know. All these circumstances combined to render daily payments necessary, and daily payments therefore were generally made from an early stage of the operations.

This system of daily payment to individuals involved an elaborate organization, which is provided for in the rules prescribed by this Government and known as the rules of the 5th December. The general principle was to divide the workers into charges containing about 5,000 persons exclusive of dependants. At the head of each charge was a charge officer of the standing of "náib tahsíldár." The "officer in charge" was responsible for the general management of the charge, including admission and classification of relief workers, payment of wages, supply of food, care of dependants, hospital arrangements, and submission of accounts and returns. Under him were at least two clerks, one of whom was capable of keeping accounts in English. There were also two work agents (sub-overseers), employed on professional matters, such as laying out and measuring work. In organizing the "charge" individuals were grouped into a "gang." When the pressure of distress increased, and whole families came on the works, the families were kept together and ten or more families made a "gang." This gang was the unit with which the Department dealt, and it consisted (exclusive of dependants) of from 50 to 60 persons, 15 of whom were ordinarily diggers and the remainder carriers. At the head of each gang was a "mate," when possible chosen from the gang. The character of the mates procurable varied in different parts of the Provinces. In the 1st and 2nd Circles and in the Gorakhpur division they were usually men able to read and write, and the presence of "literate" mates lay at the bottom of the slight variation which prevailed between the system of charge control there elaborated, and the system which was maintained in the Allahabad division, where the literate mates were few and hard to find. When literate "mates" were not procurable reliance was placed on gang clerks or *muharrirs* (called also *jamadárs*), of whom there were from five to ten for a charge.

Various improvements in the system of control and payment were devised from time to time and as experience was gained by actual practice: among these may be here noticed an improvement in the muster-rolls introduced by Colonel R. R. Pulford, C.I.E., R.E., Superintending Engineer of the 2nd or Oudh Circle, whereby the names and residence of each individual worker, the quantity of work done by him or by the gang to which he belonged, and the daily payments made to him can be ascertained at a glance, and fraud at once detected and exposed. This system leaves but little to be desired, if, indeed, it can be improved upon.

In organizing and conducting large relief works particular attention was paid to the provision of medical comforts, sanitation, and a pure water-supply. A field hospital was attached to every large work or charge, under the control of a

medical subordinate, whose duty it was to attend to all urgent cases of illness, supervise the sanitary arrangements, and submit periodic reports on the health of the workpeople. The provision of a supply of pure drinking water was everywhere put in the fore-front of the organization, as a matter of supreme importance. It is now a well-established fact that nothing is so productive of disease on works—especially of cholera—as impure drinking water. The first step, therefore, taken in opening a relief work was to take possession of the wells in the neighbourhood (or to make wells if none existed), to disinfect and purify them, and thenceforward to control the drawing and distribution of the water. To this end a special staff organized with reference to the caste and religious susceptibilities of the people was employed, and a plentiful supply of water-carts or water-vessels was procured. Water for drinking purposes was distributed at fixed places selected with the view to the convenience of the workers, the supply being furnished by these water-carts or vessels.

In this connexion the following remarks by Mr. Palmer, Superintending Engineer, Allahabad Circle, are of much interest:—

"The experience of the present famine and latter part of the preceding one affords the highest presumptive evidence of the value of permanganate of potassium as a disinfectant in cholera. During April 1896 we were attacked by cholera, and could not in any way get rid of it except by marching the people from place to place till it died out. We felt all the time that we were not combating it, but simply running away till it was tired out. Under this difficulty I consulted Professor Hankin of Agra on the subject, and he immediately furnished me with instructions on the use of permanganate of potassium, which were issued to all on the 18th April 1896; but the permanganate did not come to hand till May. In the succeeding epidemic of May 1896 the permanganate was used somewhat perfunctorily and without any understanding of its importance, or much belief in its efficacy, on the part of the Officers-in-charge and the Visiting Inspectors: its use, however, extended. The disinfection of wells is strongly insisted on in the Public Works Department Rules issued in December 1896, and enforced general attention to the point. The first March epidemic in Allahabad was earlier than expected and caught us in the midst of a struggle with other difficulties, and without a large enough supply of the drug at hand. A supply of 1,700lbs. of permanganate was at once ordered (ready made up in 5lb. boxes of two-ounce packets) and obtained with difficulty: meanwhile the epidemic raged in just the same ungovernable way as last year. In April we got the drug well distributed at all points and the disinfection of wells going on everywhere, apparently contaminated or not. After this there was no more mere blind running away from cholera, but we were able to fight it, and we did so with early success in every case excepting the attack in Hamírpur. All officers on the relief works got to thoroughly believe in the efficacy of the drug, and much attention was given to its use. Many zamíndárs asked for packets of it for use in wells which were not near our works, and many others asked us to disinfect their wells for them. Under the name of *lál dawái* this drug is now familiar in

every hamlet of the Bundelkhand districts and is largely believed in. It has been often shown how impossible it is to ensure disinfection, very picturesquely shown by Professor Hankin in many cases; but there is no reasonable doubt that in permanganate of potassium we have a most valuable ally in combating these baneful choleraic epidemics. Altogether we used up about 1,950lbs. of the drug; and the small practical point of having it ready made up in two-ounce packets, packed 40 in a tin box, was found to be of the greatest assistance in facilitating its use. The simple directions now are, to go on putting in half a packet at a time till the water retains a faint pink colour for four hours; and to repeat the dose every week, preferably on a Sunday."

As the Intermediate system of relief works to which already reference has been made more than once forms a new and important feature of famine relief administration, it is desirable at this point to describe the circumstances under which it was devised and the causes which led to its early adoption in districts not suffering from very acute distress and on the commencement of the rains in all the remaining districts.

In the shape originally adopted, work under the Intermediate system was distributed among piece-workers or gangers, who were, in effect, petty contractors paying the labourers fixed wages and themselves remunerated by rates which allowed sufficient margin for their own labour and expenses. The works were, in fact, conducted on the ordinary system of Public Works with the small substituted for the large contractors, and provision made for securing the employment and fair remuneration for labourers requiring relief. Though possessing certain advantages, this early system was found to fail in one particular. The ganger, or middleman, had a direct object in employing only the most efficient labour, and in practice it was found impossible to always prevent the exclusion of weakly or inefficient workers who could not render a reasonably full task. The persons excluded were generally those who stood most in need of relief. Those who least needed assistance were able to earn much more than a subsistence wage, while those who most required it were sometimes unable to earn anything.

A modification was therefore introduced at first in a tentative form, in certain localities, by which the middleman was excluded and the work given out direct to the labourers by the official staff, who also measured up the work done and distributed the payment. This arrangement put an end to the complaints which existed against the system in its first form.

The objects aimed at in the modified form of Intermediate works were—

(1) to exclude from relief works those who could find employment elsewhere or were not dependent on such works for their subsistence;

(2) to get rid of so many of the dependants and useless workers as were a source of danger and demoralization, and whose friends, included in the preceding category, were able to support them ;

(3) to secure a better outturn of work for the money expended.

The first object was gained by the imposition of a more stringent labour test and by the principle of payment by results, subject to a maximum wage. Special attention is invited to this matter of a maximum wage. At page 130, Volume III, of the Report of the Indian Famine Commission, a doubt is expressed whether it was possible to obviate the objection raised to the system of piece-work labour in that it permitted a practised or professional workman to earn more than need be allowed him as relief. The experience now gained shows that the objection can be obviated by the imposition of a maximum wage combined with careful maintenance and check of muster-rolls. The maximum wage may be regulated with reference to the individual labourer or to the family.

The limitation on possible earnings, while securing this first object, tended also to prevent competition with private employment or ordinary Public Works.

It may be added that the Intermediate system, as worked by this Government, though imposing a maximum wage limit, does not include any provision for the payment of a minimum wage irrespective of task. This minimum wage is prejudicial to economy and discipline; it cannot, indeed, be dispensed with when famine is acute. But it should never be permitted except in connexion with the task and gang system prescribed by the Code : and even then should be qualified by the enforcement of the penal ration or removal to the poorhouse in case of malingerers.

The second object was furthered by permitting the able-bodied members of a family to earn enough to support their dependants as well as themselves. And here it may be noted that work was so regulated on week days, as to permit the labourers to earn so much extra during those days, as would support them and their dependants, without work, on Sundays.

On the third object noted above no explanatory remarks are called for; it is self-explanatory.

Further experience of the working of this Intermediate system led to two modifications of the scheme as first defined. Families coming on the works brought young children who were unfit for labour, but could not be separated from their relatives. It was observed in some localities that the condition of such children was bad, owing to neglect or indifference on the part of their parents. This phenomenon was not

confined to Intermediate works or due to any defect of system. It was first observed on the Famine Code works, where the children received a money dole sufficient for their support. It was even noticed in the case of children for whose maintenance the parents had gratuitously received similar money doles at their own homes. One of the unhappy effects of this protracted scarcity has been to weaken the ties of domestic duty and parental affection, and to lead parents to consume themselves the relief provided for their children who were not required to work. Where this state of affairs existed, the plan was adopted first on Code works of supplying young children with cooked food instead of a money dole. On Intermediate works, where the necessity arose, discretion was given (and often acted on) to Divisional Officers to authorize distribution of cooked food to young children and to add one pice to supplement the diet of nursing mothers. This was no doubt a departure from the original principle; but as these children could not be removed from their parents and placed in poorhouses or on village lists, there was no alternative but to either acquiesce in their maltreatment or to provide them with a daily meal.

It was further discovered that the standard task originally laid down, though suited for persons of ordinary physique, pressed hardly on persons who were infirm or in reduced condition. When such persons were employed to any substantial extent with effective workers, the outturn of work and the earnings of the whole party were reduced—a result which pressed unfairly on those who had themselves rendered a full task. Permission was consequently given to form these weaklings into separate gangs and prescribe a reduced task for them. No other change in the system was found necessary, though occasionally the proportion of carriers to diggers was exceeded where it became necessary to find employment for a disproportionate number of applicants of the former class.

Though the Intermediate system was undoubtedly effectual in keeping down the numbers on relief works, yet it is not possible to quantify the exact reduction attributable to that cause alone. The reopening of field labour had caused many to leave the works before the Intermediate system was introduced, and the same cause continued to operate after its introduction. At the same time there are instances of works being abandoned and not resumed as soon as the system of payment by results was enforced. The information before Government showed that numbers left to seek other employment who would have remained under the Code system, and that many more were deterred by the same consideration from returning after the completion of the *rabi* harvest. Persons, for instance, who were content to resort to works in the neighbourhood of their homes and earn a subsistence wage by a

few hours' labour, would not undertake piecework, which required a fair day's work for a fair wage.

It may be observed that districts under the Intermediate system have kept wonderfully free from cholera during the summer. The outbreaks have been few and mild. Among the large numbers on Code works in the very distressed districts the cases of epidemic cholera have been more numerous, persistent, and fatal. The cause is to be found in the better physique of the people in the districts in which the Intermediate system prevailed, in the absence of the weak and sickly "dependants," and consequently in the less crowded state of the works, which rendered easier the preservation of the water-supply from pollution.

Generally it may be said that this Intermediate system was not suitable for districts where the distress was most acute. In such tracts it was necessary to arrange works which would provide a moderate fixed task and a bare subsistence wage for each applicant. The piecework system was unsuited for such conditions. The Intermediate system was accordingly restricted to those districts where distress was less severe and less extended. These comprised all districts, except the four Bundelkhand districts, South Allahabad, and Hardoi. Only in the case of a small portion of Unao, bordering on Hardoi, was it found desirable to revert again to the Code system in those districts in which it was abandoned.

It is necessary now to revert to the sequence of events. Early in December the general orders already mentioned as the outcome of experience gained in the Bundelkhand famine were supplemented by the issue of more detailed instructions, which, though based generally on the Famine Code, differed from it in the method of computing wages, in simplifying the classification of workers, and in the methods of enforcing task work. These instructions (for the basis of which the Lieutenant-Governor was indebted to Mr. Palmer, Superintending Engineer, Allahabad Division) took the shape of rules, divided into sections, which, as the headings noted in the margin will show, dealt with the management of relief works in detail. These rules include instructions drawn up by the Government Bacteriologist and Chemical Examiner, for the purification and disinfection of wells as a means of checking epidemics of cholera. They include also a ready reckoner for the calculation of wages. These rules as issued have, it is believed, been adopted in some other Provinces as the basis of the Public Works relief organization there.

I.—Establishment.
II.—Tools and baskets.
III.—Funds and supply of coin.
IV.—Drinking water.
V.—Food.
VI.—Field hospitals.
VII.—Hutting.
VIII.—Conservancy.
IX.—Organization of relief labour.
X.—The task; setting out work, and getting it done.
XI.—Wages.
XII.—Reports and accounts in the field.
XIII.—Checking work, numbers, and payments.

It was from the first recognised that these rules, based as they were chiefly on experience acquired in part of one

Province, would be liable to modification in order to suit the diverse conditions of other parts of the North-Western Provinces and Oudh. It was accordingly laid down that while certain general principles of universal application which the rules embodied should not be altered without the express sanction of Government, yet that a reasonable discretion was allowed to executive officers on the spot in adapting the rules on other matters to particular or local requirements. Although through the famine there was no hesitation in adapting the rules to circumstances as they changed, owing to the advent of the spring harvest, the change in the season, outbreaks of cholera or other circumstances, still the only substantial deviations of importance introduced, consisted in the method of payment and in an improved form of gang register to which reference has already been made.

But while the Government thus gave a very large measure of discretion to the officers on the spot, it insisted on the submission of immediate information as to what had been and was being done. The District Engineer, so soon as he had compiled the return (Form III, Famine Code) which he is required to forward to the Collector weekly, submitted a note directly to the Chief Engineer detailing the number of persons employed, the expenditure incurred, the work done, the rate of wages paid, the number of works open, and other particulars. An abstract of this information for the whole province, together with the notes themselves, was submitted weekly to the Lieutenant-Governor by the Chief Engineer personally, and instructions taken in regard to any matters which appeared to require attention. Where a doubtful point required explanation, the District Engineer was addressed direct, usually by telegram, and in other cases the Superintending or Divisional Engineer was addressed. This procedure saved much time; because as the Superintending or Divisional Engineers were constantly moving, any periodical returns requiring their intervention would probably, in the ordinary course, have reached Government many days after the District Engineer's notes were actually received. A further, and a very great, advantage was the diminution in office work, no periodical returns of this nature being necessary from Divisional or Superintending Engineers. The tendency as the famine increased in intensity was to insist on these notes being more and more full and complete, thus enabling the Government to judge whether the pressure at the time was being adequately met, whether one district or division could spare assistance for another, whether sufficient provision was being made for the future, and above all whether the expenditure was being kept within reasonable limits.

The preparatory measures already described were completed by the 5th of December, well in advance of

the pressure which followed. They were devised to meet the exigencies of a famine which it was foreseen would be severe, but the extent and duration of which was necessarily uncertain. The Government in its famine policy had three aims. The first aim was to ensure that all destitute persons should be relieved: the second that they should be compelled to do all the work of which they were capable, partly as a test of their requiring relief, and partly to obtain value for expenditure incurred: the third aim was the strict limitation of the relief administered or the expenditure incurred to the amount necessary to save life. There were two main tests of distress—a high task, and a low subsistence wage combined with a distance test. In the districts which had not suffered in the preceding year high tasks were enforced. In those acutely distressed districts which had passed through a famine in the preceding spring and summer the condition of the people was so low that a high task could not be performed, and here, at first, reliance was placed on the subsistence wage combined with the distance test. In other words, people had not only to complete the task entitling them to the subsistence wage, but they had to show that they were really in need of relief by seeking it at some distance from their homes. Later on, after the *rabi* or spring harvest had replenished grain stocks to some extent, the "Intermediate system" of works, which has been explained, was introduced and had the effect of a fairly high task very rigidly enforced. But at all times and under both systems the task exacted was all that could be obtained in the conditions under which it was necessary to grant relief. The high proportion which carriers (women and children) would bear to diggers was foreseen in the rules; but in judging the Public Works system of famine relief during 1897 on the basis of the quantity of earthwork executed per unit and its cost, it must not be forgotten that a substantial part of the Provinces had passed through a severe famine in 1896: that the condition of the population then was very enfeebled: that during the *rabi* harvest, and to a lesser extent from that time up to the close of the relief works, the people, especially the diggers employed on relief works, consisted largely of the old and infirm, those capable of doing a full or more than a full day's work having found employment elsewhere in harvesting, where they could earn more than a subsistence wage. While food grain was selling for less than 10 seers (20lbs.) per rupee, the maximum wage was seven pice for a digger or $1\frac{3}{4}$ anna. When the price of food grain fell to 12 seers (24lbs.) per rupee, the maximum wage was lowered to $1\frac{1}{2}$ anna per day, while adult carriers got $1\frac{1}{4}$ anna and children proportionately less. No wage in excess of that admissible under the rules was ever permitted. So that persons in good physical condition, who could earn

more than a bare subsistence wage elsewhere, found in the relief works no attraction. It was only when a whole family came and worked together that a fraction over the bare subsistence wage could be earned by the group.

Whilst every endeavour was made to select for execution only works of a permanent character and of distinct public utility, those works or portions of works which could not be carried out by relief labour were deliberately left undone. For instance, where unmetalled roads were made—and they were the class of work which were most generally carried out—no bridges were built. In order to render these roads completely useful, bridges will, no doubt, be necessary; but the Lieutenant-Governor declined to permit funds provided by the Imperial Government for famine relief to be expended on work for skilled labourers, who were not distressed and who could find their ordinary employment elsewhere. The works carried out are therefore less complete than they would have been had the principle restricting employment to persons really distressed been less scrupulously followed. But so well has the work been done that in response to inquiries made recently as to the sum necessary to repair the damages caused by the late heavy rains to these famine roads, estimates for no more than Rs. 130,488 have been sanctioned. This gives an average of something more than Rs. 39 a mile. In order that the famine roads may be permanently useful, they must be bridged, and estimates for bridges are now being prepared. The bridges will be constructed from provincial or district funds.

The works carried out, with the exception of some canal works, were mostly roads, tanks, and wells with a few miscellaneous works. The great Sarda Canal project, which was first suggested as the backbone of relief work in Oudh, was after careful inquiry both in the office and in the field not undertaken. It was found that this great project called for more mature consideration than could, in the throes of the present emergency, be given to it. It seemed to involve engineering difficulties as well as a danger of waterlogging the country, in which the water level was found by extensive experiments to be much nearer the surface than had been supposed. Moreover, the opposition of the landholders and the vast expenditure the work would necessitate rendered it impossible to undertake it as a famine measure without delay or further consideration.

The only railways on which work was executed were the extension of the Oudh and Rohilkhand and the Bengal and North-Western Railways, which had been in progress before the famine set in. The reasons why no fresh railway projects were undertaken were these. As stated in Article 18 of the

North-Western Provinces Famine Code, railways are, as a rule, unsuitable as famine relief works, owing to the very small percentage of the cost which is spent on unskilled labour. The most suitable works for relief purposes are unmetalled roads, tank, canal, and drainage works; it is only after these are exhausted or when it is clear they will not suffice to afford all the employment necessary that railways, in which about four-fifths of the expenditure does not serve relief purposes, should be undertaken. The Government of India, having regard to these considerations, enumerated four railways, marginally noted, on which work might perhaps be commenced, and authorized this Government to make arrangements with the Bengal and North-Western Railway Company to commence one or more of the several extensions or branches of that system which had been previously proposed. But with one exception no progress could be made with these projects. The alignment of the Agra-Delhi chord line was so doubtful that work on it could not be undertaken during the famine, while the Government of India eventually found themselves unable to sanction the commencement of the Gháziabad-Moradabad or Shikohabad-Mainpuri-Farukhabad line. The Hardwár-Dehra line was begun; but this railway does not pass through famine districts.

(1) Gháziabad-Moradabad.
(2) Shikohabad-Farukhabad.
(3) Agra-Delhi chord.
(4) Hardwár-Dehra branch.

In regard to the extensions of the Bengal and North-Western Railway, the construction of the Azamgarh-Sháhganj connection was sanctioned; but work could not be begun before the rains had set in. It was intended to carry out the Gorakhpur-Captainganj-Gandak Railway by famine relief agency, the Directors of the Bengal and North-Western Railway Company agreeing to eventually take over the line. But the surveys were not ready, while in the Gorakhpur district the other works in the programme were found more than adequate for the emergency.

Certain projects for light railways or tramways were also considered; but as the proposed alignments passed through regions which required no relief works, the projects were not pressed.

In Chapter II of this narrative it is stated that except in Bánda, where a few quarry works remained open in August 1896, all Department of Public Works relief works in Bundelkhand had been closed by the middle of the preceding month of July. These quarry works continued during August to attract a few labourers, but it will be convenient to regard these insignificant relief operations as falling within the period of the local famine of 1896; and to date the commencement of the general famine relief operations from October 1st. If this be done, the progress of relief operations controlled

by the Department of Public Works during the general famine may conveniently be divided into four periods :—

I.—From the 1st October to the 30th November 1896, which was largely a time of preparation, though by the end of November nine districts had been declared to be distressed and regular relief or test works under Public Works control were in progress in 11 districts.

II.—From the 1st December 1896 to the end of February 1897, when works were expanding in all districts, the culminating point being the last week in February.

III.—From the 1st March to 15th April, during which famine works were in active progress, though the numbers on relief works were, compared to the second period, much diminished, owing to the harvest operations in progress and to the general introduction of the modified Intermediate system in districts where distress was not most acute.

IV.—From the 15th April to the 30th June, when relief operations again expanded, owing to the completion of the harvesting, and to the continued pressure of prices which, owing to causes already noticed, had not fallen to any marked extent.

V.—From the 1st July till the 15th September, when operations became gradually contracted and when only selected works, such as *kankar* collection and stone quarrying, could, owing to the rains, be carried on. All famine relief works under the Public Works Department were closed on the 15th September.

The numbers of persons on relief works under the control of the Public Works Department were as follows on the last Saturday in each month :—

Month.	Famine Districts.			Scarcity Districts.			Grand Total.
	Workers.	Dependants.	Total.	Workers.	Dependants.	Total.

15th September 1897.	6,266	1,002	7,268	*Nil.*	*Nil.*	*Nil.*	7,268

The largest number employed on the same day was 1,064,124 workers and 261,826 dependants, or a total of 1,325,950, more than nine-tenths of the dependants being children under seven years of age. The largest number employed on any one day not being necessarily the same day was as shown below. The figures are given with the object of indicating the greatest pressure in each circle:—

1st Circle	...	...	94,154
2nd Circle	...	...	451,000
3rd Circle	...	...	143,471
3rd Additional Circle	...	...	777,016

The first period of the famine was mainly preparatory; but at the end of November the following nine districts had become distressed: Allahabad, Hamírpur, Bánda, Jhánsi, Jalaun, Jaunpur, Rae Bareli, Sitapur, and Hardoi, while several other districts were under observation. In the 3rd Additional Circle, in which over one-half of the persons on relief works in the Province were employed, the Public Works permanent staff was familiar with the system to be followed, having learnt the lesson in Bundelkhand in the previous spring and summer: and there was no difficulty there in commencing works wherever and whenever required. The tools and plant which had been procured for the famine in the earlier part of the year were more than ample for the present requirements. In other districts the staff generally had not had the advantage of previous experience; but they were, so far as possible, leavened with experienced men, they soon settled down to the work, and no difficulty was found in providing work as required, especially as in the beginning the influx of distressed people was gradual. Afterwards the advent of people to the works was more difficult to deal with, being marked by rushes, numbering many thousands, at one time and place. To provide a sufficient staff for such conditions the plan was adopted of appointing subordinates as supernumeraries to charges in operation, in order to enable them to acquire the requisite experience. Having been taught, they were drafted for employment at all points of pressure.

The second period of the famine, 1st of December 1896 to the end of February 1897, was that in which the greatest strain was felt by the Public Works Department. The number of distressed districts rose to 19 and the number of persons on relief works increased daily, corresponding additions being from time to time made to the subordinate staff. The greatest difficulty was experienced in connection with the sudden rushes of large number of distressed persons to works in particular districts and parts of districts, to which allusion has already been made. For example, in the Allahabad district there was a rush of nearly 60,000 people in a few days. This caused an intense strain, the nature of which may be judged from

the following passage from the report of Mr. Palmer, Superintending Engineer of the Allahabad Circle:—

"The organization had to register these vast numbers of people; form them into gangs and parties; find and keep them in work; keep them going with tools and baskets; measure their work; pay them daily; draw and distribute their drinking water, and disinfect every well they approached; continuously force them to observe the simplest rules of sanitation; provide a number of them with shelter; run up field hospitals; attend to their wants and shift them to new ground in epidemics; and, finally, to bury or burn the dead. They were in such vast numbers, and so large a proportion had temporarily broken with their village life, that it was necessary to look after them in every detail. In addition to these duties a large proportion of the children had to be fed; and at one time over 40,000 children were receiving two cooked meals a day, prepared and distributed at 283 different places scattered over an area of over 15,000 square miles."

Still the system proved stronger than the strain upon it.

To control the vast multitude (which, as already stated, reached 1,325,950 people in the end of February), to direct the professional and general management of the works, to regulate payments, and to supervise the administration of gratuitous relief to dependants and the maintenance of sanitary precautions, the staff, including officers of the rank of Upper Subordinates, consisted of 136 officers, departmental and military, classed as follows:—

Chief Engineer	1
Superintending Engineers	4
Divisional Engineers	8
District and Assistant Engineers	44
Military Officers lent by the Commander-in-Chief ...	20
Upper Subordinates	26
Visiting Inspectors	33
Total ...	136

The subordinate agency when at its greatest strength consisted of the following officers who worked under the controlling staff mentioned above:—

77 Lower subordinates.
652 Work agents (answering to Lower subordinates).
274 Náib tahsíldárs (Officers-in-charge).
104 Ditto (not Officers-in-charge).
142 Hospital assistants or compounders.

The smallness of this controlling staff is noteworthy. It will appear later on that the cost of establishment was only Rs. 3,77,844, or less than 3 per cent. on the amount of wages paid.

The period, 1st March to 15th April 1897, marking the continuance of the spring harvest, exhibited a diminution in the numbers of persons on the works in all districts except in some of the Allahabad division; and in most districts the decrease was permanent. The chief incidents of this period were the dispersal of the relief workers in the Allahabad

district into small charges of 500 to 700 persons, owing to the cholera epidemic, which has already been referred to, and the introduction of the "Intermediate system" of works into all districts except Bundelkhand, Allahabad, and Hardoi.

The period between the 15th April and the advent of the rains in June was marked by a vast increase in the numbers on relief works. The employment afforded by the spring harvest ceased towards the end of April: and people who were dependent on labour for their subsistence, and who had saved but little from employment in gathering a very short harvest, flocked back to the works. The pressure on the establishment was renewed, and in the end of May nearly reached the pitch it had attained in the end of February. But this period produced no new developments calling for adaptations or adjustments of system or rules: the events were repetitions of previous experience, although reproduced under infinitely more trying circumstances of climate and general health.

Towards the end of May it became necessary to provide for the advent of the rains, and on the 27th May general orders were issued by Government touching the principles which were to be observed when the rains commenced. With the object of reducing all inducements to persons to remain on relief works after the rains had commenced, instructions were issued to stiffen rates and increase tasks when labour in the fields once more became practicable.

The rains began in the third week of June and produced an immediate effect on the number of labourers, which, in anticipation of the advent of the monsoon, had previously shown a tendency to fall. On the 19th June the number of labourers and dependants was 942,000 in round numbers; on the 26th June the number had fallen to 417,775. Owing to the unfortunate suspension of the monsoon rains during the first fortnight of July, to which reference has already been made, the numbers rose again, and on the 10th July stood at 465,161; but on the re-establishment of the monsoon about 12th July the numbers again rapidly fell: so that by the end of July they stood at 92,511, and it was possible to close the departmental relief works in 19 out of the 36 districts which were distressed or under observation. About the same time it was found possible to calculate the wage rate in the most distressed districts on the basis of a price current of 12 seers of food grain per rupee instead of 10 seers as previously, and to reduce the staff materially.

During the period from the 1st of August to the 15th September works remained open in 17 districts, and consisted mainly of *kankar* collection and stone quarrying, the number on the last Saturday of August being 23,795 and on the 15th of September 7,268 persons. After the Lieutenant-Governor had visited the distressed divisions in July, orders were issued

to close all works on the 15th of September, which were duly carried out.

It was at one time stated, though not originally in connection with these Provinces, that relief works attracted labourers from railway works. In the North-Western Provinces and Oudh railway works were during the prevalence of the famine in progress in the districts marginally noted. In the first four districts named no relief works of any description were undertaken during the famine. In the three remaining districts the maximum number of persons—men, women, and children—employed at any time on relief works never exceeded 46,000 out of a population of 5½ millions, and were usually very much below this figure. Obviously these figures could in no case lend much support to a charge of competition with private or other enterprise: and a minute examination of the facts shows that they lend no support whatever. The Gorakhpur district, of the three, furnished the greatest number (33,000) of relief labourers; while none of these were employed in the vicinity of the railway works. In Azamgarh, so long as railway works were in progress, special care was taken not to open relief works in their vicinity, and the Railway Resident Engineer, at the height of the pressure (in May) admitted that, as a matter of fact, no labourers had been attracted from railway to relief works. In Gonda the numbers on relief works were always insignificant. If private employers failed to obtain all the labour they wanted, the reason was that the rate of wages they offered failed to follow the great rise in the prices of food. If any railway in these Provinces experienced a similar difficulty, the difficulty was due to the competition of other railways. Ordinary labourers could not get a subsistence on the works at the normal rates paid by the Railway employers operating in the North-Western Provinces and Oudh; though, as a prominent Railway Manager said, the Luniah (professional labourer) could earn a subsistence "at extra good lift and lead rates." The result was that the ordinary labourer was not attracted to the railway works, while there was an unusually large emigration of the professional class in October and November, long before relief works were started, to the Assam-Bengal Railway. The contract rates in famine districts for earthwork on railways should have been increased if the railway desired to command the labour market; but this increase was not made. The rate paid on relief works in Gorakhpur from the end of March was Re. 1-14-0 per thousand cubic feet, or three annas per one hundred cubic feet only. As in that district 100 cubic feet was the ordinary daily task of a working party of three individuals who were not allowed to execute more than 125 cubic feet in one day as a

(1) Bahraich.
(2) Ballia.
(3) Benares.
(4) Ghâzipur.
(5) Gonda.
(6) Gorakhpur.
(7) Azamgarh.

maximum, it is obvious that the party could earn no more than three annas and nine pies between them. As gratuitous relief to dependants on the works was not then allowed, it is obvious that with grain at 10 to 12 seers the rupee no more than a bare subsistence could be earned on relief works, and that there could be no competition for labourers between relief and railway works.

The fact is that the numbers of persons employed on relief works in districts where railway works were in progress were comparatively insignificant. Of those so employed, only a small proportion (less than one-sixth) could in any case have earned on railway works a living wage; while the proportion of the sixth who might have conceivably been employed on railways had, whilst working on relief works, to be content with a wage of three annas and nine pies per day per family, usually consisting of five people. It is repeated that in such circumstances there could have been no competition with private employers.

The expenditure on the works carried out under the circumstances and on the system described in the preceding paragraphs in connexion with the general famine from 1st October 1896 up to the close of the Departmental relief operations on 15th September 1897 was as follows:—

	Rs.
Works, including wages of relief labourers, cost of work establishment and expenditure on contingencies	1,16,77,295
Gratuitous relief—	
I.—To dependants	8,27,038
II.—To relief labourers for allowances on Sundays and other days when labour was suspended	9,62,968
Establishment	3,77,844
Tools and Plant	6,04,230
Total ...	1,44,49,375

The following figures show the expenditure in each circle, and permit an opinion to be formed of the relative pressure of the distress in each:—

	Rs.
First Circle	7,32,949
Second Circle	31,80,213
Third Circle	12,18,503
Third Additional Circle	93,17,710

The total number of persons relieved, reduced to units supported for one day, was 179,744,948 or a daily average of nearly one million for six months. The gross cost per person relieved was therefore 1 anna 3·4 pies per head, no credit being taken for the value of

Men	46,754,823
Women	59,019,687
Working children ...	39,266,996
Dependants, mostly children under seven years...	34,703,442
Total ...	179,744,948

the work done or the value of tools and plant, a large part of which will be gradually sold, and some recoveries thereby effected.

In calculating out the average daily *wage* paid, a deduction must be made from the total sum paid under the head of *works* on account of expenditure on contingencies, and the cost of work establishment. The average daily wage resulting falls at 13·3 pies per head or Rs. 2-1-3 per mensem.

The average cost of the gratuitous relief to dependants emerges at 4·5 pies per head per day, or 11 annas 3 pies per mensem.

Attention has already been called to the exceptionally low proportion which the cost of establishment bears to the total expenditure. This is due to the policy which this Government steadily pursued of working almost entirely with Native agency, and trusting to precise rules, constant supervision, and exact procedure controlled by European officers for the maintenance of fair dealing and strict discipline.

The works, which may all be classed as "Major," comprise 3,274 miles of road constructed or remodelled—a mileage which is more than three times the distance of Calcutta from Bombay. In addition 1,463 reservoirs (some very large) and tanks were constructed or excavated, and these also may be regarded as major works, the tanks having been constructed in groups. Moreover many useful miscellaneous works were completed which are enumerated in the Superintending Engineers' Reports printed in the appendices to this narrative. The roads constructed or raised were, as a rule, either feeder roads to railways or roads which it had been some years previously determined to construct or improve as part of a general scheme for developing the inter-district communications of the North-Western Provinces and Oudh. They should be all regarded as of a permanent nature and of distinct public utility. The reservoirs constructed, and the tanks deepened or otherwise improved will in all cases be of use, and in some cases of great value, to the community. They must also be regarded as permanent improvements of their kind, in some cases of general and in all others of local utility. In Bundelkhand and Allahabad, where this class of work has been most extensively carried out, tanks are especially valuable, being there extensively used for purposes of irrigation. In all cases the reservoirs and tanks are an important addition to the district resources, not only as being useful for irrigation and watering cattle, but also as tending to keep up the water-level in the village wells, which are usually not far from the tank. In both Allahabad and the Bundelkhand districts there is in the hot weather a greater or less deficiency in the water-supply, so that works tending to its improvement were very desirable.

The quantity of work carried out is shown in the following figured statement:—

	1st Circle.	2nd Circle.	3rd Circle.	Additional 3rd Circle.	Total.
	Cubic feet.	Cubic feet.	Cubic feet.	Cubic feet.	Cubic feet.
1. Earthwork in roads,	177,351,471	410,283,143	125,367,894	340,561,599	1,053,564,107
2. Ditto in reservoirs, tanks and canals.	525,220	57,043,612	81,056,569	440,863,046	579,488,447
3. Stone, broken, in some cases also carried.	*Nil.*	*Nil.*	164,213	1,550,000	1,714,213
4. Gravel excavated ...	*Nil.*	*Nil.*	18,152	1,875,000	1,893,152
5. Limestone nodules collected.	409,999	209,956	912,780	*Nil.*	1,532,735
6. Bricks excavated from old Forts, &c.	*Nil.*	729,307	*Nil.*	*Nil.*	729,307

The total quantity of work done is therefore, reducing the heavy stone and gravel work to the denomination of earthwork, about 1,680 millions of cubic feet. Having regard to the number of labourers exhibited in the penultimate page, the outturn of work done by each group of one digger and three carriers (Sundays and non-working days being excluded) would be 52 cubic feet daily. If it be borne in mind that this average includes persons engaged on sanitary, conservancy, and miscellaneous duties, that 28 per cent. of the workers were children, and that the diggers as well as the carriers were generally of poor physique, this outturn will not appear inadequate.

In reviewing famine expenditure estimates are usually given of the cost which would probably have been incurred in executing, by ordinary labour in an ordinary or non-scarcity year, the work actually done during the famine year. Into all such estimates considerable uncertainty must enter because much of the work done in relief of famine is never undertaken or done in ordinary years by the same classes of people, or in the same quantities, or at the same season of the year, or under similar conditions of exposure to inclemencies of climate or the attacks of disease. As the Superintending Engineer of the 3rd Additional Circle says in his report—

"The work ordinarily done by the Public Works Department is comparatively small in quantity and is done by the temporarily surplus labour population during the season suitable for most effective digging or else when labour is otherwise unemployed: and the ordinary Public Works Department's rates are based on these conditions. If earthwork were required in large quantities—in quantities even remotely approaching those we are dealing with—to be carried out throughout the hot weather, it would be impossible to get it done for the usual Public Works rates. I doubt whether any reasonable addition to the ordinary rates would enable us to get this quantity of work done in an ordinary year in these districts. But putting that aside it is certain that a rate of not less than Rs. 4 per 1,000 cubic feet would have to be given for the work; and probably that rate would not get any large proportion of the work completed."

Having regard to these considerations the Chief Engineer (with whom this Government agrees) is of opinion that the following statement exhibits with reasonable fairness the

cost at which the work actually done during the famine might be done in an ordinary or non-famine year:—

	1st Circle.	2nd Circle.	3rd Circle.	Additional 3rd Circle.	Total.
	Rs.	Rs.	Rs.	Rs.	Rs.
Estimated cost of work if carried out by ordinary labour in an ordinary or non-famine year.	5,30,000	15,20,000	7,50,000	40,00,000	68,20,000

The extra cost of the work done which should be charged to famine as expenditure on relief proper and on sanitary precautions is, therefore, about 48 lakhs of rupees. The value of the work done has therefore been 59 per cent. of the total expenditure incurred, while if the cost of the special sanitary precautions taken on the works be deducted, the per-centage will exceed 62 per cent.

The circumstances of the various parts of the North-Western Provinces and Oudh vary so much that figures giving for the Provinces as a whole a general average of the quantity of work done per head or the cost per 1,000 cubic feet must be of little value. But the averages for each Public Works circle are more instructive. They are exhibited in the following statement which gives the cost per 1,000 cubic feet of earthwork calculated on the total expenditure of 116¾ lakhs under the head "Works":—

	1st Circle.	2nd Circle.	3rd Circle.	Additional 3rd Circle.
	Rs. a. p.	Rs. a. p.	Rs. a. p.	Rs. a. p.
Rate per 1,000 cubic feet of earthwork, dressing included, Famine Code system.	3 9 5	6 2 7	5 12 5	9 2 5
Rate per 1,000 cubic feet of earthwork, dressing included, Intermediate system.	3 5 5	3 13 11	4 0 2	5 14 8

The comparatively high scale of rates in the additional 3rd Circle is accounted for by the very reduced condition of the Bundelkhand peasantry who had passed through a serious famine in 1896, and by the circumstance that the black cotton soil of that region when baked with the sun resists the pick or shovel almost as stone does.

In conclusion, it may be mentioned here that neither the accounts prescribed in the Famine Code nor the ordinary Public Works accounts give the information which is necessary for statistical purposes, and that one important administrative lesson clearly taught by the late famine is the necessity of determining, in the first instance, what information is necessary for statistical or other purposes, and so arranging the initial accounts that the heads of expenditure and details of numbers of persons employed shall be separated in such a manner as to permit the information wanted being readily obtained. This will be provided for in the new edition of the Famine Code which is now being prepared in the light of the experience of the last two years.

CHAPTER X.

Relief measures carried out by District Officers and Private Agencies. The Indian Charitable Relief Fund.

SECTION I.—*Minor Relief Works.*

THE foregoing chapter describes in necessary detail the system of large relief works carried out under the control of the Public Works Department. But in addition, and subsidiary to these large projects under purely professional management, many small works of various classes controlled by the District Officer and his staff were also undertaken for the relief of distress. These latter works were generally known as village works, being specially intended for the relief of certain classes of the agricultural population in the vicinity of their villages. Such projects are chiefly, if not exclusively, useful to the people of the neighbourhood where they are undertaken, and they serve local rather than general public interests. The excavation of minor village tanks, the construction of small embankments, the improvements of village communications, and the removal of insanitary defects in the village site, are their chief purposes.

The Famine Code contemplates that these smaller works should be utilized in the early days of scarcity. But during the late famine, for reasons already stated, it was not found expedient to adhere to this principle. Large works under the control of trained officers of the Public Works Department were found both more effective as tests and more capable of ready expansion to meet the large and unforeseen demands which characterized the early stages of the famine. Village works, on the other hand, were found more suitable in the advanced season of the year, when the water-supply runs short, when the collection of great numbers of workers in one place is attended with danger of epidemic disease, and when it is desirable to find employment close to their homes for persons who, for one reason or another, are unable to join the large relief camps. It was for these reasons, for example, that the Public Works Department abandoned the great relief works in the Allahabad district in favour of groups of smaller undertakings.

But it is not with village works managed by the Department of Public Works that we are concerned in this chapter; but with village works controlled by District Officers without Departmental intervention. A programme of such projects was held in readiness in every district from the beginning, and a few works of the class were begun at an early stage here and there, in the affected districts, either to meet special or local urgency, or—an important reason—to test the sufficiency of the arrangements which would be required

later; but as a rule the works were carried out after the famine had fully declared itself.

For reasons both of administration and economy, it was the policy of Government to associate, as far as possible, the local landholders in the management of these village projects. The experience gained in the Bundelkhand Famine, described in Chapter II of this narrative, showed this policy to be advantageous. Accordingly in 1897 landed proprietors were encouraged and invited to contribute towards the expenditure, as well as to participate in the management, of works by which they themselves and their tenantry would be benefited. To secure such co-operation grants of money free of interest, but partly recoverable within two years, were made to landlords for carrying out village relief works calculated to improve the agricultural condition, the water-supply, and the general sanitation of their villages. Rules were drawn up (which will be found in the Appendix volume) to regulate these partly recoverable advances and the works to be constructed from them.

The dominant principle guiding the selection of these works was that they should be suitable for the employment of relief labour, while being of utility to the village community. They were permitted only in localities where relief was required; and due provision was included in the rules regulating them, for the employment and the remuneration at fair wages of the classes in the village who required relief. The works were estimated for and laid out by a civil works Inspector and were kept under inspection while in progress. The landholder undertaking the work was bound to furnish accounts and pay the labourers daily.

Under these restrictions, and subject to the control of the District Officer, the selection and management of these works was left to the landholder. He received two-fifths of the estimated cost on the commencement of work; two-fifths when it was half finished, and the remaining fifth when the final measurements showed that the project had been completed in accordance with the estimates. The landholder entered into an engagement to repay within two years a proportion of the advance, which varied from three-fourths in the case of the least distressed villages or individuals, to one-fourth in the case of the most distressed.

The sums disbursed in the shape of these partly recoverable advances aggregated Rs. 4,88,109, a substantial portion of which will ultimately be repaid by the local proprietors to whom the money was advanced. From this expenditure were constructed 1,147 tanks and 271 embankments designed like the tanks to collect and store water for irrigation purposes, besides supplementing the supply of drinking-water for the villagers and their cattle. Advances under

this system were not made for the construction of masonry wells, as such works were not suitable for the employment of unskilled labour. For the construction of masonry wells, advances under the Statutory rules were given. Besides the tanks and embankments, village roads were repaired and some works of sanitary improvement carried out, such as clearing and draining village sites or filling up insanitary excavations. The works afforded employment to 8,629,788 persons stated in units for one day.

The total amount of earthwork done in works of this class is returned at 147,034,550 cubic feet; the rate falls at Rs. 3-5-1 per 1,000 cubic feet, which is cheaper than the cheapest Intermediate rate of the Public Works Department. The daily cost of each person relieved was 10·9 pies, which is about two-thirds of the average cost per head on the great relief works managed by the Public Works Department. The greater economy is doubtless due to the unwillingness of the managers to employ inefficient labour, to which reference will presently be made.

Works of this class had considerable attractions because they gave employment to labourers who could live in their own homes instead of migrating with their families to relief camps. Such conditions would naturally attract persons who would not submit to the severer test and who only needed a little help whereby to eke out an otherwise insufficient livelihood without throwing themselves altogether on State assistance. These were persons of a rather better class than the ordinary day labourer, who, however hardly pressed, would be deterred by pride or by household duties from seeking the more distant and more public relief works. The managers of village works were found to give preference to the better castes and to look more to securing economy of working than to making provision for relief. It thus came to pass that weakly and inefficient labourers were found to seek distant State relief works though village works were in progress in the immediate vicinity of their homes. From one point of view this indicates a defect in the system as a method of general relief: from another point of view it signalizes an advantage and a self-acting principle, which restricts the relief to a particular class for whom large relief works are unsuitable. The facts, however, serve to justify the preference shown by this Government for the large projects conducted by trained officials under strict rules, while they indicate that the system of village works controlled by local unofficial agency serve a very useful purpose as adjuncts to the large relief works. They afforded assistance in an economical and suitable way and under special conditions to classes of persons for which these latter works would have been inappropriate.

Closely akin to the class of works just described are small projects carried out by District Officers entirely at State

expense, in the most severely stricken districts, when the landlords were too impoverished to take advances on the terms stated above, or on any terms involving repayment. In the character of the projects, their utility and their objects, no distinction can be drawn between them and the village works constructed out of partly recoverable advances. In the selection, too, of these projects, and in their control and supervision, the District Officers sought and obtained the assistance of the local landholders and other leading residents of the localities where these works were undertaken, and as in Bundelkhand in 1886 this agency proved a useful auxiliary to the limited official staff available for the purpose.

The works constructed in this way include 324 tanks, 24 embankments, and other minor irrigation works. They afforded employment to 2,825,281 persons stated in units for one day, at a daily cost of one anna six pies per head, and represent 57,864,639 cubic feet earthwork at a total expenditure of Rs. 2,69,061: being a rate of Rs. 4-10-5 per 1,000 cubic feet.

Though less economical than the works in which the local landholders were personally interested because sharing the cost, the results do not compare unfavourably with those already reported for the large projects under professional management in the Allahabad division, where these works were nearly all situated. It will be remembered that in this division the rate for earthwork under the Intermediate system, excluding establishment and contingencies, rose to Rs. 5-14-8 per 1,000 cubic feet.

Under this head also may appropriately be treated the extensive works carried out by His Highness the Mahárája of Benares in that portion of his Family Domains situated in the Mirzapur district in which famine prevailed. When the Local Rates Act (III of 1878) became law, the Mahárája was (at his own request) relieved from the payment of the rates on landed property imposed by that law, on the understanding that he should on his part accept the liability for all famine relief operations which might at any time become necessary in his Family Domains. This undertaking has now been loyally discharged by the Mahárája, who placed the control of all relief operations for the Family Domains in the hands of the Government, and furnished the funds necessary for the purpose. The system of relief in the Family Domains, which, though carried out by the Mahárája's own officers, was controlled by the Deputy Superintendent with the co-operation of the Mahárája's son, the Honorable Kuar Aditya Narayan Singh, followed the principles prescribed for the adjacent districts, and involved the expenditure of Rs. 1,24,559 on relief works. (There has also been expenditure on gratuitous relief to which reference will be made later on.) These works consisted exclusively of small

embankments to intercept and retain surface water for irrigation purposes—the form of work which is found most practicable and useful in the hilly part of the Domains where famine prevailed, and where the rocky soil is unsuitable for the construction of wells. The work afforded relief to 1,286,010 persons, stated in units of one day, at a daily cost of about one anna seven pies each.

Closely associated with the various relief measures organized by the State or at its expense are the operations carried out by the Court of Wards for the relief of tenants of estates under Government management and paid for out of the revenue of those estates. The functions of the Court of Wards in these Provinces are exercised by the Board of Revenue, and the obligation which rests on a landholder to assist his tenantry in times of distress naturally received full recognition on the State-managed properties. Unfortunately a large proportion of these estates are too heavily encumbered to meet any special call upon their finances.

The relief works carried out by the Court of Wards took the shape of improvements to the estates concerned, either in adding to the facilities for irrigation, repairing village roads or paths, removing insanitary defects, extending drainage, improving estate buildings or increasing the agricultural resources of the various properties. An abstract of the projects shows that they included tanks, wells, embankments, roads or pathways, drainage or irrigation channels, works promoting sanitation or conservancy, and other miscellaneous projects.

The varied character of the improvements renders it impossible to formulate by measurement the outturn of the work, or to state with strict accuracy the number of persons employed. But the returns which are forthcoming show that 1,120,356 persons were relieved on these works at an outlay of Rs. 1,12,902.

The large and flourishing estate belonging to the minor Rája of Balrámpur in the Gonda district was conspicuous for the assistance extended to its tenantry, of which, stated in units of one day, it employed 626,918, at a cost of Rs. 43,573, or one anna one pie per head daily. Some of the encumbered estates which had no surplus funds available took advances from Government to defray the cost of relief works, and others assisted their tenants by standing security for them. These works were carried out by the different Estate Managers and their staff under the control and supervision of the District Officers.

To sum up the results of the relief afforded by these minor works which have now been described, it may be said that 13,861,435, or nearly 14 millions of people were relieved for one day, at a cost of Rs. 9,92,186. The average cost per head was one anna and two pies.

Before parting from this branch of relief measures, it is right and appropriate that the Government should acknowledge the assistance furnished in the shape of numerous works which were carried out entirely at their own expense in various parts of the Provinces by private gentlemen, chiefly of the landowning classes, in order to supply employment for destitute labourers. This ancient and characteristic form of charity calls for recognition here. Though a useful auxiliary to the State or State-assisted relief works, yet it is naturally not possible to formulate with any precision the cost of works so executed, or the extent to which they afforded relief. The best estimates available go to show that they cost their promoters Rs. 3,27,758 and that they relieved about four million people for one day.

SECTION II.—*Gratuitous village relief, poorhouses, and State kitchens.*

Next after the operations of the Public Works Department by far the largest volume of relief was administered through the outdoor or village relief system, poorhouses, and State kitchens. The organization of the system of village relief has already been described in detail, and the place which poorhouses and State kitchens occupied in the general scheme has also been stated in Chapter V above. It is needless, therefore, to repeat the description here; or to do much more than exhibit the statistical and financial results of these great departments of the relief system. The following tabular statement displays the numbers who were in receipt of outdoor relief or were inmates of poorhouses on the last Saturday in every month from the commencement of relief operations in October 1896 to their close:—

Month and Year.	Number on outdoor or village relief.	Number in poorhouses or in State kitchens.
October 1896	7,340	13,532
November „	8,787	21,251
December „	30,435	39,951
January 1897	232,662	57,286
February „	263,950	51,435
March „	252,982	30,974
April „	262,470	31,107
May „	288,339	38,947
June „	330,256	42,837
July „	357,576	48,770
August „	334,248	34,180
September „	197,395	10,230
October „	605	.....

The number of units or persons gratuitously relieved for one day by Government under the outdoor relief system was 76,601,544; while the number of persons similarly relieved for one day in poorhouses and State kitchens was 12,272,416. The total thus gratuitously relieved for one day by Civil (as distinguished from Public Works) Officers was 88,873,960.

The cost incurred in connexion with poorhouses and State kitchens, all charges included, amounted to Rs. 10,48,922, the average cost per head of the inmates thus falling at 16·41 pies.

The total cost of outdoor relief amounted to Rs. 35,54,555, the average expenditure per head being 8·90 pies.

Besides the gratuitous relief administered at the cost of the State, similar relief was distributed under the control of officers of Government in the Family Domains of the Mahárája of Benares and in estates managed by the Court of Wards. The expenditure in the form of gratuitous relief in the Family Domains amounted to Rs. 41,055; while in the Court of Wards' estates Rs. 59,612 were similarly spent (the Balrámpur Estate contributing Rs. 41,929 out of this total). An accurate tally of the number of indigent people relieved has not been kept; but it may be reasonably put at 1½ million units for one day.

This exhausts the various channels of purely State activity: and it is now possible to present a summary of the statistical results for both the smaller famine of 1896 and the great famine of 1897.

The statistics of expenditure and relief during the Bundelkhand famine of 1896 have been already given in Chapter II. They brought, it will be remembered, the account down to the end of August 1896. September 1896 was a transition period. Famine, though imminent, had not been declared, and the small measures of relief still carried on in a few districts, which had suffered severely in the preceding summer, were more in the nature of test than organized relief. Throughout the whole Provinces the number of persons (units for one day) assisted by Government in that month was but 381,840, and the expenditure Rs. 28,869. The total cost of the smaller famine of 1896 may therefore be stated as Rs. 12,09,022, and the number of people thereby relieved as 19,881,840 (units for one day).

Taking the 1st October 1896 as the date on which the general famine began and systematic relief was again fairly launched, the numbers* relieved by the State from that date till the end of the famine were as follows:—

* Including persons relieved in the Family Domains and in Court of Wards' estates.

By the Department of Public Works	... 179,744,948
By Civil Officers—	
(*a*) On works	... 13,861,435
(*b*) In poorhouses and by outdoor relief	... 90,373,960
Total units for one day	... 283,980,343

The expenditure, according to the Department of Accounts, under the head of famine, including Rs. 3,38,127

of outlay incurred in the Family Domains of the Mahárája of Benares and in estates under the Court of Wards, amounts to Rs. 2,03,04,817, giving an average daily cost of 13·7 pies for every person relieved. But to this should be added various charges due solely to famine, but which under the rules of the Financial Department were to be entered under other departmental heads. It is uncertain how far this method of accounts may have obscured the actual cost of the famine; but the defect, if any, will be small as the items so far traced amount only to Rs. 1,74,401 from the 1st October 1896 to the end of operations. The addition of this sum brings the total outlay for all forms of relief from 1st October 1896 to Rs. 2,04,79,218 and the daily cost of each person relieved to 13·8 pies.

If to these figures of cost and numbers relieved during the famine of 1897 be added the corresponding figures for the relief operations of 1896, it will appear that 303,862,183 or in round numbers 304 millions persons have been relieved for one day at a gross cost of Rs. 2,16,88,240, or 1·14 annas per head. Converted into sterling at current exchange, the cost falls at £1,400,000 or one and one-tenth of a penny per head.

SECTION III.—*Operations of the Indian Charitable Relief Fund.*

In the course of the previous narrative various references have been made to the operations of the Indian Famine Charitable Relief Fund, and to the advantages which this Fund has conferred on these Provinces during the continuance of distress. Some reports of the working of this colossal charity have already been presented to the public by the Chairman and Vice-Chairman of the Central Executive Committee of the Fund, and it is understood that when the operations are brought to a close the Committee of the Fund in these Provinces will give an account of its stewardship. But without anticipating the full details which will probably be contained in that account, it is desirable in this place to state very briefly the general outline of the history of this most beneficent bounty.

In accordance with the initiative taken by His Excellency the Viceroy at the public meeting held in Calcutta on January 14th, 1897, a public meeting, at which the Lieutenant-Governor presided, was held in Lucknow on the 25th of the same month, to form a provincial organization to co-operate with the Committee already formed in Calcutta. A General Committee of the Fund in these Provinces was elected and an Executive Committee appointed to administer the Fund under the Presidency of the Chief Justice, Sir John Edge. This Executive Committee was subsequently subdivided into two branches, one for the North-Western Provinces, with Sir John Edge as Chairman, and one for Oudh, under the Chairmanship of the Judicial Commissioner, Mr. Deas.

The Executive Committee at once took steps to bring about the formation of District Committees of the Fund for the purpose of raising subscriptions locally and, in the districts where this was necessary, of instituting and controlling measures of relief. In many districts, particularly those in which the larger cities lie, there were already in existence Relief or Charity Committees, whose objects coincided with those of the Indian Famine Relief Fund. These were utilized as District or Local Committees of the Fund.

A question which at once presented itself for solution was through what agency should the various forms of relief intended to be given from the Fund be distributed. Two alternatives presented themselves: the first was the creation of an agency independent of the Government organization already employed on the administration of relief at the expense of the State; the second was the utilization for the purposes of the Fund of the Government organization already in existence. It was decided to adopt the latter course more especially for the distribution of relief in rural tracts, but at the same time to make the fullest use of the various Missionary agencies and other charitable bodies, which had their centres of work in the great cities and to a less degree in the smaller towns, but were rarely at work outside such areas.

It is unnecessary here to give details of moneys received by the Provincial Committee of the Fund and its District Committees. Briefly it may be stated that from the beginning of operations up to the 31st October 1897, the total receipts of the Committees of the Fund in these Provinces amounted to Rs. 51,43,453. Out of this the sum of Rs. 46,68,763 was the contribution remitted by the Central Committee and Rs. 4,71,945 was the amount of the subscriptions raised in the Provinces; the remaining items of receipt were chiefly the proceeds of the sale of articles made by artizans and others whose relief took the shape of wages for work done.

The objects of the Relief Fund were thus defined by the Government of India at the time when subscriptions were first invited :—

"Government fully accepts general responsibility for saving the lives of the people in tracts in which famine prevails; and it is essential that private charity, while working side by side with, should not interfere with or overlap the operations which are organized for this purpose. There is, however, ample scope for its exercise in supplementing these operations, in mitigating suffering, and in relieving distress which falls just short of absolute destitution. Especially, private contributions might usefully be expended on the following objects:—

Firstly, *in supplementing the subsistence ration which alone is provided from public funds, by the addition of small comforts, whether of food or of clothing, for the aged or infirm, for the patients in hospitals, for children, and the like*

As guardian of the public purse, and in view of the magnitude of the calamity, Government is obliged to limit its assistance to what is absolutely necessary for the preservation of life.

Secondly, *in providing for the maintenance of orphans.*

Every famine leaves behind it a number of waifs who have lost or become separated from those who should be responsible for their maintenance. It is necessary to provide for these till they are of an age to support themselves.

Thirdly, *in relieving the numerous poor, but respectable, persons who will endure almost any privation rather than apply for Government relief, accompanied as it must be by official inquiry into, and by some kind of test of the reality of the destitution which is to be relieved.*

The feeling of the sacredness of the *parda* or domestic privacy is intensely strong in India; and it is most difficult for any official organization to reach, or even to ascertain with certainty the existence of distress of this nature.

Fourthly, *in restoring to their original position, when acute distress is subsiding, those who have lost their all in the struggle, and in giving them a fresh start in life.*

The peasant cultivator may often thus be saved from losing his holding through sheer inability to cultivate it, and from sinking to the position of a day labourer.

The efforts of the Provincial Executive Committees were carefully directed towards the accomplishment of these four objects. On the first three of these objects the total sums expended out of the Fund up to the 31st October 1897 amounted to Rs. 12,29,916, of which Rs. 9,07,157 was paid out in the North-Western Provinces and Rs. 3,22,759 in Oudh. On the fourth object—which in the opinion of the Lieutenant-Governor was from the beginning the most important, seeing that the Government had from the outset charged itself with the prevention of starvation—the sum spent was Rs. 35,38,403, of which Rs. 24,93,792 pertained to the North-Western Provinces and Rs. 10,44,511 to Oudh. Including a charge of Rs. 11,664 for the working expenses of the 46 Committees existing in the Provinces, the total sum expended by this great and bountiful organization up to 31st October 1897 therefore amounted to Rs. 48,28,486. On that date these numerous Committees had in hand a balance of Rs. 3,14,966 which was in a large part in process of distribution for the purchase of seed for the spring sowings.

Out of the remaining balance, and with the assistance of a further special contribution expected from the Central Committee, provision has still to be made for the maintenance for some years to come of the orphans and waifs whom the famine has sent adrift: this being one of the declared objects of the Fund.

It is not possible at present to state the exact number of persons who were relieved through the agency of the Fund. Detailed reports and statistics from every district are now

being received and examined by the Provincial Committee, and a complete statement of relief is being compiled. But from the periodical returns, which furnish the only information at present available, an approximately accurate calculation may be made of the total number relieved for one day. For the first three objects of the Fund the numbers reduced to units for one day are these—

I.—Number of persons in receipt of Government relief who obtained "additional comforts" for one day ...	7,289,217
II.—Number of orphans relieved for one day, towards whose maintenance the Fund contributed ...	215,063
III.—Number of respectable poor gratuitously relieved for one day	21,801,764
Total ...	29,306,044

Besides these, 416,031 different families shared in the distribution of Rs. 35,38,203 for the purchase of plough-cattle and seed grain and other necessities of their calling. The average donation to each family thus appears to be about Rs. 8-8-0. But a certain number of the payments under this head were to labourers for tools, to weavers for yarn, and so on; and as these payments were all of small amounts, the average payment for plough-cattle and seed grain only would be considerably higher, probably over Rs. 10 per family. If the average family be taken at five persons, the number of persons who benefited by this form of distribution will exceed two millions.

The statement of the objects of the Indian Famine Charitable Relief Fund, which has been set out above, shows that the Fund was not established with the idea of displacing or dispensing with the Government relief. The relief given at the cost of the State had never been confined within definite limits. As has already been mentioned in the course of this narrative, the necessity of the sufferers had been accepted by the Government as alone setting metes and bounds to the assistance to be given; this principle had inspired the design of the relief measures and had guided their execution. The action of the Fund came, therefore, as supplementing and not as superseding the operations of the Government; but in that sphere it had an enormous effect in alleviating the lesser hardships which existed, while the worst effects of the famine were being removed by the Government relief. Undoubtedly, however, the greatest result of the Fund has been the widespread efficacy of the gifts made for the purpose of "restoring to their original position those who had lost their all in the struggle and giving them a fresh start in life." Overwhelming testimony has been received to the excellent effects which the Fund working through this channel has produced. The tale of this great bounty

will remain with the people as an abiding memory of the large-hearted charity of the English-speaking public.

Besides the bounty offered by the Indian Famine Charitable Relief Fund there have been other manifestations of charity from outside India, such as the distribution of grain by charitable America; the distribution of clothes sent by the Marchioness of Dufferin and Ava; the distribution of money by Lord Radstock's Fund, called "Christian succour to India." And besides all these there has been a free and generous distribution of charity by the well-to-do landed proprietors and merchants throughout the country. It is not possible to quantify or gauge the extent of this last mentioned charity; but it cannot be doubted that it has had a great effect in mitigating the effects of the famine: and it therefore merits grateful recognition in this place.

CHAPTER XI.

Food supply, Prices, and the effect of high prices on Crime.

In the earlier part of this narrative it has been shown that from the outset it was the policy of the Government to leave the food supply entirely to private trade and to rigidly abstain from all interference with its operations. It would be superfluous in this place to array the overpowering arguments in favour of this policy, which strictly follows the principles laid down by the Indian Famine Commission. Its best justification will be found in the practical success which has attended it.

When prices rose to the extreme level which they attained in the autumn of 1896, representations were made to the Lieutenant-Governor by public bodies, associations, and even by Government officials, who considered that the State could usefully and effectively undertake to regulate prices by engaging in the import business or by controlling the public sale of grain at beneficial rates. An instance of such representations has been already quoted. This Government, however, from first to last adhered to the principle of non-interference. In one or two instances in isolated tracts where there was some doubt whether the resources of the petty village traders would be equal to the task of importing the grain required for consumption on relief works and in remote villages, discretion was given to local officers to assist such traders if necessary with money advances; but this discretion was little used. Private trade everywhere and always proved equal to maintaining and distributing an adequate supply of food grain even in the most distressed and most isolated tracts. There can be no doubt that this would have been impossible but for the extensive railway communications which now exist in all parts of these Provinces, whereby the wheeled traffic and pack-cattle were set free to spread the grain among the villages from the nearest railway stations. A generation ago (in 1867) Mr. Girdlestone, summarizing the lessons of previous famines, insisted upon the futility of attempting to supply the deficiency of the harvests by importation. He quoted figures to prove that the cost of moving as much as 400,000 tons into the distressed tracts would be absolutely prohibitive, while Mr. (now Sir John) Strachey gave reasons for holding that the total carriage of the Provinces would not suffice to convey one-tenth of the 800,000 tons required to feed the Rohilkhand division alone. Since those distinguished gentlemen wrote a revolution has taken place in the condition of internal trade. People no longer in famine times migrate or move to food; food is now moved to them. The railway traffic returns now show

that for nine months alone, from October 1896 to June 1897, the rail-borne imports of food grain were 645,628 tons and the exports 306,377, while this vast and beneficent trade movement was effected not only without difficulty or apparent effort, but with great pecuniary advantage to the State.

Of these imports nearly 325,000 tons came from Bengal, the greater part being Burma rice carried from Calcutta.

Besides the usual traffic returns furnished by the Director of Land Records and Agriculture a special record has been maintained since the 30th January 1897, showing week by week the imports and exports of food grain by rail for each district of the United Provinces. Both of these sets of returns are printed as an Appendix to this narrative. They display certain discrepancies, due to the difference in the time which they cover, to the different systems on which they are prepared, and possibly to some difference in classification. The Director's returns are quarterly and prepared by large territorial blocks, and do not show transfers from one district to another within the same block. The Railway return is weekly, and shows the imports and exports of each district irrespective of the place of despatch or distribution. Both are confined to rail-borne traffic.

During the Bundelkhand famine in the summer of 1896 the net imports of food grain into the affected districts amounted to 27,500 tons. The balance required for consumption during the period was supplied by local stocks, which were thus much depleted. In the last quarter of 1896 the net Provincial imports came to about 168,500 tons, of which more than half was received by the Allahabad division and over a quarter by Agra. The Benares block, including the Benares and Gorakhpur revenue divisions, was the only other large importer. At this particular time the Meerut division, in spite of its prosperous condition and its good harvest, gave little assistance to the distressed parts of the Provinces and on the whole showed a net balance of imports. The only exporting division was Rohilkhand, which sent a substantial amount of grain to Meerut and to the Panjáb. It may be inferred that the greater prosperity of Meerut enabled its people to retain their produce either as a precaution against threatened distress or in hope of higher prices later on; while the more necessitous peasantry of Rohilkhand were compelled to part with a portion of theirs. The vast bulk of the net provincial imports came from Calcutta and other places in Bengal. The Panjáb supplied practically nothing; but the Central Provinces, in spite of their own distress, sent 16,600 tons; and the Bombay Presidency and Port nearly 8,000.

In the first quarter of 1897 the Provinces received a net import of about 1,92,000 tons, of which over 70,000 tons went to the Allahabad division. Rohilkhand in this period was obliged to import about seven times the amount it had parted

with in the previous quarter, drawing its supplies from Bengal, the Panjáb, Oudh and Meerut. The Meerut division again appears as an importer to the substantial amount of about 25,000 tons. The Bulandshahr district alone in this division was up to this an exporter of grain, and that in comparatively small quantities. It might have been expected that these districts, which had enjoyed good harvests, would, under the attraction of very high prices, have exported some of the surplus stocks which they undoubtedly held. It does not appear that any considerable quantity left the division by road. The only movement of this description ascertained to have taken place was some export from marts in Aligarh to Gwalior, stimulated by State advances made to Gwalior cartmen, who found profitable employment in carrying grain by road from Háthras and other marts outside Gwalior territory. The explanation seems to be that the peasantry of the Meerut division, who had suffered much in previous famines, held up their produce till the prospects of the future should be assured. This was in fact done everywhere; but the Meerut people could afford to do it on a larger scale than others. There was a general apprehension abroad that the cycle of bad seasons had not ended and that it would be prudent to hold all surplus grain from one harvest till the next had been gathered. Even the usual supply did not therefore come into the local markets, and imports were required to provide for the townspeople and for that section of the population which has to purchase its food. Certain staples also, such as gram, of which the local production is inadequate, could only be supplied by importation. This explanation, which has been tested by local observation, gains further support from the large export from Meerut which set in during the second quarter of the year. As soon as the magnificent spring harvest of the division had been secured, every district in the Meerut division commenced to send away grain in large and increasing quantities. During the second quarter of 1897 the returns for the division showed a net export of nearly 73,000 tons, of which about two-thirds had gone to the needy districts of these provinces and a large amount to Calcutta, Rájputána, and Panjáb.

During the remaining months of the famine the Meerut division continued steadily to dispose of its surplus, and was able out of its plenty to contribute to the wants of those less fortunate tracts which were obliged to seek their food and seed grain outside their own borders.

During this second quarter of 1897 the Provinces, reinforced by the spring harvest, had become more than self-supporting. The outside supply fell off and the export rapidly increased till the quarter ended with a net export of 21,245 tons. The Allahabad division continued to absorb food, but it now obtained its supplies largely from the more favoured parts of the

North-Western Provinces and Oudh. A considerable amount of Burma rice continued to pass in through Calcutta; but, on the other hand, a large movement of grain set in towards Bengal and the seaboard, and the Central Provinces began to take back the supplies they had sent during the two previous quarters. The Gorakhpur division was now exporting largely; and many of the Oudh districts, where the spring wheat had proved unusually good, were disposing rapidly of their surplus. The movement of grain continued to be considerable during the next three months, when the Provinces sent away a net balance of about 14,000 tons. The great bulk of the supplies available in the well-stocked districts found their way to the more destitute parts of the province where the highest prices prevailed. During the whole period the Meerut division continued to export largely; while the canal-irrigated districts of the Agra division began to part with their stocks in July when the prospects of the autumn crops became favourable, and this movement increased as those crops were reaped. The Gorakhpur division maintained a brisk export through July; but the business slackened towards the middle of August as the local stocks became depleted and the new harvest had replenished other markets. By the beginning of September the Gorakhpur district had begun to import grain. Rohilkhand wavered between exports and imports; only the district of Bijnor continued to draw its supplies steadily from outside till the early autumn staples were ready. The districts of the Lucknow division during these three months imported steadily, except Sitapur and Kheri, whose superior harvests enabled them to dispose of a large amount of produce. The Fyzabad division also showed its return towards prosperity by the steady, though moderate, balance of its exports during these months.

The Benares division continued a steady importer even after an excellent autumn harvest would have enabled it to sell largely. This circumstance cannot be attributed to any deficiency of its stocks or produce, and unless its grain was removed by river traffic and so escaped registration (which is probable), it must have accumulated large stores.

The Allahabad district continued all through to import large quantities of food, much of which was re-exported from Cawnpore to the distressed districts of Bundelkhand. This movement began perceptibly to slacken in September, when the early crops had ripened and food became available locally. The Provinces as a whole recovered rapidly during this period.

In reporting to the Governor-General in Council on the general condition and prospects of the Provinces in the end of November 1896, the Lieutenant-Governor made the following observations:—

"In regard to the question of food supplies and private trade, the only measure which the Lieutenant-Governor and Chief Commissioner has been able to suggest was the reduction of railway freights on food stuffs

consigned to these provinces. All that could be done in this way has been done by the Government of India, and no further measure seems practicable, unless a departure be made from the principle of non-intervention with private trade. But the Lieutenant-Governor is strongly averse from such a departure and has publicly expressed his aversion. It is true that the prices of food grains throughout these Provinces at the present time are phenomenally high and that the list of prices current present many of the features, notably that of approaching equality between the prices of the coarsest and the best food grains, which characterize famine times. But trade at the present time is active. Without pretending to accuracy on the question of food stocks available in the Province—a matter on which, indeed, accuracy is unattainable—the Lieutenant-Governor believes that there is an ample supply for three or four months; and even should this supply not receive the full accretion from the *rabi* crops which is to be reasonably expected, still he thinks that private trade may be fairly trusted to make good the deficiency. At all events, there is nothing in the present condition of things which induces Sir Antony MacDonnell to recommend any interference with the free play of private trade."

These anticipations were fully realized.

The figures already given and those printed in the Appendices to this narrative deal exclusively with rail-borne traffic. The only road or river traffic at present systematically recorded is that inconsiderable traffic which enters from Nepál and Thibet. The railway traffic shows with sufficient accuracy the trade between the entire Provinces and other parts of India; but the present returns take no account of the extensive road traffic which is the largest distributing agency between district and district. It has been ascertained, for instance, that a large and steady movement of grain went on by road from Cawnpore and Allahabad into Bundelkhand, and no doubt drained off a large portion of the net rail-borne imports shown against the former districts. Observations made at Kálpi, where the road from Cawnpore to Jalaun crosses the Jumna, showed that the road imports at that point were not far short of twice the amount brought into the whole Jalaun district by rail; while at a crossing higher up the river the imports are reported to have much exceeded those which entered by the Kálpi route. The road imports into Bánda and Hamírpur were also very extensive and probably very much in excess of the rail-borne supplies. It is impossible, therefore, in the absence of any record of road traffic, to say how far each of the distressed districts was fed by imported grain.

During the spring and summer of 1896, prices throughout the Provinces generally reached a level which had been attained in the past only during times of famine. But still, even in the Bundelkhand districts where distress prevailed, the price of food grain did not rise above 21lbs. or 22lbs. for the rupee for the better staples, while coarse grain was procurable at 30lbs. or 32lbs. In the middle of September, when the apprehension of a general failure of the crops began to spread

Notes—(1) The black lines represent the average price of wheat, and the red ones that of the cheapest grain for the time being in eight marts of N.-W. Provinces and Oudh, viz., Jhansi, Cawnpore, Benares, Lucknow, Meerut, Bareilly, Gorakhpur and Agra.

(2). The fine lines denote the prices for the years 1896-97, and the bold ones those of the normal year 1891-92.

Lithg. T. C. Press. Roorkee.—No. 4428

the average rates throughout the Provinces as a whole were 20½lbs. of wheat and 27½lbs. of coarser grain per rupee. As the weeks passed without rain prices rose rapidly. In the middle of November, when the loss of the autumn harvest had been established beyond hope of retrieval and the prospects of the spring sowings were at their worst, the average prices had risen to 15lbs. of wheat and 20½lbs. of the cheapest grain per rupee. Nor was this the rate in famine districts only, but the average deduced from prices current in the leading markets throughout the Provinces. The normal prices, ascertained for the purposes of the Famine Code, were 29¾lbs. per rupee for wheat and 40 or 41 for the cheapest of the coarser grains. The price lists printed in the Appendix volume will show how little prices varied between the worst and the best districts. The difference cannot even be measured by the cost of carriage. Sometimes the rate of a particular grain will be found quoted higher in a well-stocked Meerut district than in a market of afflicted Bundelkhand. Prices were in fact artificial and highly sensitive, and were influenced by considerations which it was often impossible to ascertain or gauge.

The 15th November 1896 marks the highest level reached by prices. The favourable rain which fell at the end of that month entirely altered the prospects of the spring crops, and the demand for seed grain being satisfied, prices began to fall. The relief was slight, but it served to restore confidence, which the steady rise of the previous two months had shaken.

December, with many variations, saw on the whole little or no improvement. In January 1897 the prospects were better, and by the end of the month prices had slightly relaxed. Wheat had in many places exceeded 18lbs. to the rupee, and on an average of the leading markets stood at 17½lbs. The coarser grains, however, showed little tendency to a relaxation of price, with perhaps the exception of common rice, which was influenced by the large importations which had set in from Burma. But the improvement was not generally maintained. The high winds which blew during February caused a good deal of apprehension and anxiety concerning their effect on the outturn, which reflected itself at once in prices, and February ended no better than it had begun. By the middle of March, however, this panic had worn out; it had become evident that the crops on all the better lands were turning out well, and by the end of March a decided fall in prices was manifested, which naturally showed itself chiefly in the main staples of the spring harvest. Some of the autumn grains on the other hand began to show signs of exhaustion. Wheat now averaged 20lbs., and in many places sold for 22lbs., per rupee. Barley, now the cheapest of the coarse grains, reached 25½lbs. per rupee, and in a few of the better-stocked markets went up to 29lbs. and 30lbs. April brought slightly easier prices; but after that month the tendency became

retrogressive. Wheat rose slightly till the middle of June, and made another small slight advance in August, and thenceforth showed little tendency to relax till after the demand for seed grain in October had been satisfied.

The coarse grains wavered in price through June and July as the prospects of the harvest rose and fell. In August they began to decline as the new grain approached maturity, and by the end of September were decidedly easier. There was no longer any scarcity of food in the country, although the market quotation showed the quantity procurable for one rupee to be no more than 30lbs. But the market was no longer a gauge of the quantity of food available. Throughout the villages the early millets and maize could now be obtained at a reasonable rate and in sufficient quantities for local consumption, though they had not found their way in bulk to the central markets.

The leading features in the history of prices during the famine period may be briefly stated. The first was the high level to which prices attained and the persistence with which they remained at that level. The second was the extreme sensitiveness of the market to every passing influence, the oscillations however being within narrow limits, and the close and very persistent approximation in price between wheat and the cheapest of the coarser staple food grains. This characteristic has been observed in previous famines, but was never so marked as on the present occasion. The outturn of the autumn harvest in 1896 brought no relaxation, and the extensive imports left prices unaffected. The large addition made to the food-supply by the spring harvest of 1897 effected a much smaller improvement than there was reason to anticipate. It was confidently expected that when the prospect of a good autumn harvest in 1897 was assured a sharp fall in prices would at once set in. But this expectation was not realized. Though crops of perhaps unrivalled excellence have been now assured, and though food has now become abundant in the rural tracts, yet the rates in the larger markets, by which the prices current are ruled, gave way slowly and up to the end of October had not reached a point which taken by themselves would indicate the return of plenty. Making every allowance for the casualties of preceding seasons, for the extensive failure of the autumn crops in 1896 and the short spring harvest of 1897, and for the scarcity prevailing in other parts of India, it would still be unsafe to ascribe the phenomenally high prices of 1896-97 altogether to depletion of stocks and exhaustion of supplies. In the very distressed districts where the crop failure has been continuous and severe the phenomenon is intelligible. But it can be scarcely said that throughout the country generally the character of the late harvests has been such as to explain the extraordinary and persistent enhancement of prices which occurred.

It may be that the slow-acting influences of currency and trade have contributed at this epoch a certain stringency to prices that might have been expected at an earlier stage in financial history, and it may be that such stringency has come to stay. But passing over this speculative aspect of the question there is something in the relation of prices to stocks during the famine period which remains unexplained.

The estimate already given of imports and exports and the movement of prices make it reasonable to believe that, taking the Provinces as a whole, the food supply in existence never fell below the requirements of the people. Though in some tracts the local resources were undoubtedly deficient, yet in other parts there were surplus stocks which the very high prices that prevailed would, under ordinary conditions of trade, have drawn towards the depleted districts. As soon as such trade movement set in, the Provinces ceased to import, and commenced even to send away grain to other Provinces. It may be inferred that prices were kept up at least as much by an anticipation of still worse scarcity to come as by the pressure on stocks which existed at the time. Popular opinion imputed this to the action of the large holders in central markets, anxious to hold out for still higher prices. As in Judæa of old, this led to vehement feeling:—"He that hideth up corn shall be cursed among men; but a blessing on the heads of them that sell." But all the facts and probabilities point the other way. They go to show that the stocks in the hands of traders were abnormally low, and that such grain supplies as existed were largely retained in the possession of the cultivators and those petty dealers whose transactions do not extend beyond their own villages. When the deficiency of previous seasons was followed by the failure of the rains in 1896, a belief gained general prevalence that the country was on the eve of a famine of great intensity and duration. Every cultivator retained all he could from the produce of his fields to meet the wants of his own family and relations in the coming time of trial. Prices are regulated by the stocks in the hands of traders, and they kept up because the markets were starved by the retention of produce in the hands of the non-trading classes.

This explains why, with each successive harvest adding to the supplies, prices failed to show any adequate relaxation.

It explains why village prices after a successful harvest were much cheaper than the prices in central marts.

It explains why the canal-irrigated districts, in spite of excellent crops, continued to import grain till the bountiful yield of the spring crops found the cultivators' granaries still stocked with the produce of a previous harvest.

It accords with the circumstance, already noticed, that the prosperous peasantry of Meerut were able to hold up their grain while the more necessitous people of Rohilkhand, Oudh and Gorakhpur were compelled to part with much of theirs.

Some further confirmation of these suggestions may be found in the character of the people who resorted to relief works. The vast bulk of them were drawn from the landless classes, day-labourers, and workmen who were not themselves holders of land. The cultivating classes formed a small proportion of the relief workers. Doubtless the high prices they had previously got for their produce increased their power of resisting the pressure of hard times.

If this explanation is correct, if the rural population were both able and willing to husband their resources through such a period of deficient harvest, and if they have begun to lay by in times of prosperity and high prices (the latter largely the result of improved communications with great markets), then it must be recognised that they have shown a spirit of providence, as they have certainly this year exhibited a power of resistance to pressure of scarcity, hitherto unknown in these Provinces.

Reference has more than once been made in the course of this narrative to the law-abiding and patient spirit displayed by the body of the people at a time when the temptations and the opportunities for crime were great. This spirit is reflected in the crime returns of the period.

Crime in its bearing on famine and famine relief may be divided into two heads: *first*, the crime which is associated with turbulence, violence, public disorder, or concerted outrages in which whole classes of the community are associated; *second*, that simple or ordinary crime which is the natural outcome of privation and distress. The prevalence of crime of the first category would indicate a failure of relief organization and of administrative measures to secure the protection of property. The prevalence of crime of the second kind is an indication, and can be used as a gauge, of the extent of distress. Crime of the first class was conspicuously moderate in its character and dimensions during the famine period in these Provinces. Cases of rioting and unlawful assembly were less frequent than in ordinary years. Arson is a crime which experience shows to be attendant on famine and indicative of public disorder. In the earlier months of the famine, when relief measures were in the initial stage, the attention of Government was aroused, as already stated, by a suspicious excess of such cases in some districts. This excess diminished with the growth of public confidence in the relief measures.

Another class of crime indicative of disorder is dakáiti and robbery. Crimes of this class were much more numerous than usual during the famine period; but very many of them were merely "technical dakáities," free, to a greater extent than usual, from the aggravated features which would have indicated a general spirit of turbulence. They consisted commonly of isolated cases of plunder of grain carts or stores by knots of hungry and unarmed villagers. Robberies and dakáities by armed, organized or professional gangs were unusually rare.

The chief increase of crime occurred under the head of those offences which are classed as theft or house-breaking according as they are committed outside or inside a dwelling. The reported cases of theft and house-breaking during the twelve months exceeded by 38 per cent. the previous year's return. But even this high total will not perhaps be thought excessive as the record of this sort of crime among a population of nearly 46 millions suffering from famine or famine prices. A large proportion of these crimes were of a very trivial description, such as pilfering or snatching of grain or other food, or field thefts when the standing crops were ripe. Petty offences of this class, committed under the pressure of hunger, were naturally and properly treated by Magistrates with exceptional lenience and generally punished by merely nominal sentences; while organized and violent crime was sternly repressed. A return of reported offences during the famine months (printed in the Appendix) shows that general crime, though of increased volume, moved on the ordinary lines. It rose as usual in the winter months, when field labour is slack, reaching a maximum in January, which was followed by a very sharp fall. The movement was accentuated by the special conditions of the year. The great extension of outdoor relief in January 1897 had its response in the extraordinarily rapid decline in crime, the fall being most marked in the crime classed as theft and burglary. The decrease continued through March and April, when the spring harvest brought both food and employment. During May crime remained stationary in some districts, but showed in others a tendency to rise which was accentuated in June and July. This movement is usual; but here, again, it was exaggerated by the desertion by the people in those months of the relief works which had afforded so much support to the labouring classes. By August the early crops were reaching maturity, and crime tended to resume its normal dimensions. By the close of the famine in September there was little to notice beyond the ordinary fluctuations and the natural results on the crime rate of continued high prices.

It may be observed that the increase of ordinary crime was not confined to the distressed districts, but was

shared by districts where there had been no general failure of crops and no distress among the rural population. No doubt the pressure of high prices, which fell heavily on all who had to purchase their food, stimulated crime even where there had been no crop failure or want of usual employment. The relief measures went far to equalize the conditions affecting crime in all districts.

There has been simultaneity, if not a closer connexion, between the movement of crime and the movement of prices throughout the year. The accompanying diagram shows that as prices rose in October and November the volume of crime increased with them and in the next two months remained large, while prices maintained a high level. As prices fell in March, crime decreased rapidly and reached its minimum in April, when prices also were at their lowest. Thereafter crime increased as prices again became more stringent and did not begin to sink till the early staples of the autumn harvest became available in the villages at the end of August. The correlation is not always exact, as other disturbing influences were at work. But the general identity of the movement is clear.

NOTE—A rise in the *blue* and *red* lines indicates a fall in prices and *vice versâ*.

CHAPTER XII.

Public health during the Famine period.

In the foregoing chapters the condition of the people, the prevalence or absence of disease, and the variations of public health have been noticed at different points. But the matter has more importance than that which it possesses as part of the general narrative of the progress of events. The health and vitality of the people during the famine period form one of the most direct and conclusive indications of the sufficiency and success or the deficiency and failure of relief measures. The vital statistics have throughout been regarded and utilized in this way by this Government. They were carefully scrutinized not merely month by month, but in a special fortnightly return which all Civil Surgeons were required to submit, through the Sanitary Commissioner, dealing with the general health of the people as evidenced by the mortality, the attendance at hospitals and dispensaries, the condition of people on relief works or in poorhouses, and of those admitted to jails, and by the nature or the extent of epidemic disease. This fortnightly return was supplemented by a monthly report from the head of the Medical Department on the working of the various relief hospitals and the condition of their inmates and of the persons in poorhouses or on relief works. These returns formed a valuable guide to Government in gauging the degree of success which attended the working of relief operations and in determining the necessity for any change in its measures.

The death-rate is the best test of the sufficiency or insufficiency of a relief organization. It is now possible to apply this test generally to the operations which were carried out in the North-Western Provinces and Oudh during 1896-97.

The special arrangements for medical relief have been set forth in a memorandum by the Inspector-General of Civil Hospitals which is printed in the sequel to this report. Every considerable relief work or group of works was provided with an hospital and the necessary professional staff and appliances. Every poorhouse had also its hospital under professional control, and one or more medical subordinates were exclusively attached to the more important poorhouses. The services of five Military Surgeons and four Military Assistant Surgeons were enlisted, while the special civil medical staff amounted in the time of greatest pressure to 319 officers of all grades. The mortality among relief workers and their dependants is shown to have been extremely moderate.

In poorhouses the deaths were more numerous; but, as already explained, these institutions were really in the nature

of infirmaries. They were the receptacle of all the waifs and strays, the broken-down vagrants, the cripples and diseased, and those who lived by the exhibition of their infirmities. Here were to be found all those cases of emaciation, deformity, and wasting disease which have come to be popularly regarded as types of a famine-stricken population. In the poorhouses, too, might be found those persons who persistently neglected or refused the means of relief till they were picked up in a prostrate condition and carried to the nearest relief centre. When restored to strength and drafted to works, they would usually abscond and again wander aimlessly till strength failed. The famine produced many instances of persons who had to be saved more than once in spite of themselves. Naturally the mortality in poorhouses in severely distressed tracts was high.

The comparative freedom from illness, especially of an epidemic character, in the relief centres, and the low death-rate must be ascribed to the measures taken to secure sanitation and a good supply of pure water and to check epidemic disease on its first appearance. This matter has already been briefly treated in connexion with the operations of the Public Works Department; but as it is believed that the sanitary organization on this occasion is an entirely novel feature of relief administration it may be well to state in more detail the shape which this organization took. The rules under this head and the manner in which they were carried out are thus summarized by the Sanitary Commissioner in a valuable memorandum which accompanies this narrative:—

"'Wells likely to be used for drinking water by labourers on relief works should be examined and, if found pure, should be guarded from contamination for a week before required, and the water-supply arrangements perfected before the labourers arrive. Foul wells should be absolutely closed. Should cholera break out, the wells should be disinfected at intervals of two or three days with permanganate of potash until the labourers are split up and drafted off to other works.

"'From the labourers, Bráhmans should be selected to draw water from the wells for Hindus, and Kahárs to distribute it. The vessels employed in drawing and distributing the water should be ordinarily of metal, and scrupulously clean. Kerosine tins have been found to be most useful and acceptable.

"'A superior medical officer should inspect periodically (1) the relief labourers on relief works not of the Article 65*(a)* class; (2) the sanitary and medical arrangements in connection with such works; and (3) poorhouses and hospitals.

"'The Famine Code (section 85) provides for the erection of latrines. These should usually be on the trench system, and provided with grass screens.

"'A line of flags and posts should be placed all round each relief work, and 300 yards from the same, and great care should be taken that no nuisances are committed within the area enclosed by such flags and posts.

"'Medical officers in charge of hospitals and relief works should very carefully watch for the occurrence of any cases of relapsing or famine fever, and immediately isolate any such cases.

"'Provision for the immediate isolation of cases of cholera, small-pox or other epidemic disease should be made at each work. Grass huts, which can be subsequently burnt, will usually be the best form of isolation hospital.'

"These orders were carefully carried out. As a rule latrines at the headquarters camp on a relief work were on the trench system, and posts and flags were placed round the constantly-shifting bodies of men on road works. Where works were of a more permanent character, as for instance the digging of a tank, trenches were used. The areas were usually kept very fairly clean. Probably, however, the most efficient measure was the careful custody of the drinking supply. Particular pains were taken that people did not dip their own *lotas*or vessels into the wells, but received the water from the hands of specially-appointed water-carriers, both Hindu and Muhammadan. Along the relief works water was conveyed in water-carts for the use of the labourers. In some localities the drinking water was thus carried from a considerable distance. All doubtful wells or sources of supply were kept closed under a guard. When disease broke out, or a move was contemplated, search parties went in advance to select the sources of supply and protect them. Such search parties had also to ascertain that epidemic disease did not exist in villages in the locality to which the workers were moving. Sometimes irrigation wells in the fields were cleaned out, disinfected, and used in preference to the masonry wells, as being less likely to have been polluted. Disinfection of wells with permanganate of potash was not practised only when disease was present; it was commonly adopted if any doubt whatever existed as to the character of the supply. There is no doubt as to the utility of such a proceeding; only experience showed that to be efficacious it must be practised every three or four days.

"Where works were vacated on account of cholera, the small huts of infected gangs were burnt and not allowed to be carried on to the next camp. Disposal of bodies was carried out by specially-appointed men.

"The character and condition of the food was watched. Where necessary, local officers increased the appointed ration in particular cases. Hurtful grains, such as "khesári" dál, were excluded from the works, and vegetables and antiscorbutics were regularly supplied.

"The same principles were carried out in poorhouses and hospitals. As regards the former, rules are laid down for their conduct in the Famine Code; but as the result of observation it was considered desirable to supplement them by suggestions which were accordingly prepared and issued by Government.

"These arrangements, which were settled and agreed upon before the institution of relief works, worked without difficulty, and the people soon fell in with the scheme. The Sanitary Commissioner, the Special Famine Medical Officers, the Civil Surgeons of districts, and the Deputy Sanitary Commissioners visited and inspected the works and camps at intervals, and the Public Works officers in charge of the gangs selected and appointed the subordinates from among the workers. Weekly reports were submitted to the Sanitary Commissioner's office by the Special Famine Medical officers, and Civil Surgeons and Deputy Sanitary Commissioners also reported as occasion required. Upon these reports instructions—telegraphic or otherwise—were issued where necessary. On the occurrence of serious disease or other emergent matter, copies of reports were sent by the Secretary to Government in the Public Works Department, to the Sanitary Commissioner, who was authorized to issue instructions direct to members of that Department to avoid dangerous delay. Throughout the whole course of famine relief measures no friction whatever occurred between the Public Works and Sanitary officers on the works; and it is largely to the assistance and co-operation of the former Department that the success of the sanitary arrangements was due.

"To ensure early recognition of distress in any locality, special arrangements were made. The health and condition of the general population was reported on fortnightly to this office by all Civil Surgeons, and from these reports a general statement was compiled and submitted to Government. District Officers also telegraphed the death-rates of their districts month by month.

"A circular letter was issued to all District Officers early in the year, requesting that measures might be taken so that all births and deaths in poorhouses and on relief works should be carefully recorded."

The great benefits derived from the use of permanganate of potash have already been mentioned in connexion with the operations of the Public Works Department. Its use rarely if ever excited any apprehension or opposition on caste grounds. Its efficacy was so popularly recognised, that in some cases village proprietors applied for a supply to use in their own wells. It undoubtedly proved a most useful agent in checking disease.

Mortality in famine districts in famine period as compared with decennial mean in same districts.

The red line indicates the normal death-rate. - - - - -

Outside the relief works and poorhouses the condition of the people generally can best be judged by the recorded death-rate which will presently be given for each month. The mortality is usually in almost direct relation to the severity of distress otherwise known to prevail. It was not to be expected in tracts of country where the failure of crops had been so great and continuous as to force one-third, one-half, or even a larger proportion of the population to seek State relief, and where the grain markets had only been kept stocked by imports, that no abnormal mortality would occur. Where considerable numbers of the people had been reduced to short rations and forced to subsist largely on the less nutritious articles of diet, eking out their supplies by the use of herbs, fruit, and wild produce, it was inevitable that the diseases always attendant on famine should be manifested.

The accompanying diagrams compare in a graphic manner the rise and fall of the death-rate month by month during the famine period for the Provinces generally, and also for the famine and scarcity districts. Starting in September 1896 with a death-rate slightly below the decennial mean, the advantage was maintained in that month and increased throughout October both for the whole Provinces and for the famine districts. The mortality usually falls in November, and the year 1896 was no exception. In fact the fall in the provincial rate was rather greater than usual, and in the famine districts it was almost normal. In December, however, the conditions were reversed. Instead of the usual decrease the death-rate rose slightly throughout the Provinces though still remaining below the decennial mean. The enhancement, though not considerable, was most marked in the famine tracts. The figures for the scarcity districts remained stationary. In January the death-rate, which ordinarily would have fallen sharply, remained almost steady for the Provinces as a whole, while in the scarcity districts there was a fall; but the famine group of districts displayed a further rise; these abnormal movements brought the provincial incidence a little above the average. These months were cold and wet—conditions which must inevitably tell on the large crowds encamped on relief works. Pneumonia and allied diseases were responsible for many deaths. In February more favourable climatic conditions were established. This is the month in which the provincial mortality ordinarily sinks to its lowest point. The usual fall took place in the famine and scarcity tracts as elsewhere, and in about the normal proportion. Still following the normal movement the death-rate in March rose everywhere, but more sharply than usual. For the Provinces generally it stood in this month at 3·11 per mille against a decennial mean of 2·13. In the famine districts the proportion was 3·60 to 2·13 and in the scarcity districts 3·07 to 2·14. In April there was

some improvement. Much the same districts were affected; but there was some recovery in the worst areas, and the death-rates began to fall back towards the normal level. The provincial death-rate rose as usual in this month; but the rise was much less than normal, while in the famine tracts there was an actual decrease. In the scarcity tracts there was a slight rise. The provincial rate was now 3·19 against a mean of 2·62: for the famine districts the corresponding figures were 3·52 and 2·57, and for the scarcity districts they were 3·33 and 2·77.

During May these conditions were repeated in a more marked form. Instead of the increase which usually characterizes this month, the provincial mortality fell appreciably: the fall being most decisive in the famine and scarcity tracts. The spring crops had replenished the food supply in the hands of the rural population, while the return of the warm and dry weather rendered the conditions of life more favourable to those affected before by cold and wet. The provincial death-rate was now below normal, and even in the famine districts rose but a shade above it. The same conditions were maintained in June.

There was no excessive mortality anywhere in July, but fever began to reassert itself with the development of a strong monsoon, and there was cholera among the villages where it could not be treated as effectively as it had been treated in the relief camps, which the people had largely abandoned and were now being broken up. The death-rate (2·78) rose a little above the mean (2·45), and was heaviest in the most distressed tracts. August and September are always less healthy months than July, and this year saw the usual upward movement of the death-rate, but in a pronounced form. The very continuous and prolonged rains of these months in 1897, though extremely favourable to agriculture, were fruitful in malaria. Fever became extremely prevalent and naturally swelled the death-rate among a population weakened by long privations. In August the normal mortality is 2·73 per mille: it rose this year to 3·34 and in the famine tracts, where fever was very acute, it reached. 3·96. In the scarcity districts the rise was not so marked By September the early autumn crops were ready, food supplies had become abundant, and relief operations were being rapidly wound up. In spite of the general prevalence of a bad type of malarial fever the provincial death-rate rose only to 3·86 against a decennial mean of 3·01. In the famine districts, where the conditions were most adverse, the mortality reached 4·42 per mille. In the scarcity districts the figures rose from 3·02 in August to 3·64 per mille in September.

This autumnal fever is of almost yearly appearance; its severity varies with the rainfall: being more severe when the rainfall of August and September is heavy than when it

is light; and past experience has shown that it assumes an unusually fatal form when it comes in the train of a famine. The outbreak was therefore expected, and as soon as it appeared steps were taken to meet it by the distribution of medicines on an extensive scale. Large quantities of quinine were supplied in convenient doses to all the affected districts and distributed among the people by every available agency—free to the poorest classes and at cost price to those who could afford to purchase. Enquiry showed that the fever was not of the "famine" or "relapsing" but of the ordinary malarial type; it was not confined to the poor, but fell on all classes alike, and on all with equal effect. There are obvious limitations on the extent to which medical relief can be brought to everyone, and on the efficacy of such relief. But within those limitations the same efforts were made to avert disease which had been made to avert famine, and the mortality, though high in the most malarial districts, fell short of rates recorded during unhealthy seasons when there was no famine to aggravate the conditions unfavourable to life.

In all districts fever is assigned as the principal cause of death. This heading is very general, and probably includes most cases of pneumonic and lung diseases, so fatal to people of reduced stamina (especially the very young and very old) employed on relief works and elsewhere.

The general result was that, whereas the normal mortality in the Provinces for the decennial period previous to 1896 was 33·04, during the 12 months of famine prevalence in 1896-97 it was 36·30, giving an excess mortality of only 3·26 per mille.

An abstract of the monthly returns will show at a glance how far the mortality of the famine period rose above the ordinary death-rate in any month:—

	Entire Province.		Famine districts only.		Scarcity districts only.	
	Actual death-rate.	Normal death-rate.	Actual death-rate.	Normal death-rate.	Actual death-rate.	Normal death-rate.
October 1896 ...	3·09	3·56	2·74	3·49	3 81	3·69
November „ ...	2·70	3·34	2·52	3·23	3·12	3.49
December „ ...	3·01	3·10	3·06	2 86	3·12	3·31
January 1897 ...	3 07	2 37	3 49	2·25	2 93	2·44
February „ ...	2 68	1·97	3 14	1·91	2 62	1 97
March „ ...	3·11	2·13	3·60	2·13	3·07	2·14
April „ ...	3·19	2·62	3·52	2·57	3·33	2·77
May „ ...	2·89	3·04	3·05	3 01	2 97	3 10
June „ ...	2·58	2·72	2 84	2·79	2 38	2 56
July „ ...	2·78	2·45	3 20	2·61	2·52	2·23
August „ ...	3·34	2 73	3 96	2·92	3·02	2 55
September „ ...	3·86	3 01	4·42	3·03	3·64	3 01
Total ...	36·30	33 04	39·54	32·80	36·53	33 26

The death-rate, it will be seen, rose on the whole but little above the normal average in the famine months up to July, that is for 10 months it was only 29·10 per mille in the Provinces, or 1·80 per mille above the normal. But the death-rate increased in August and September, the

malarious season. Taking the whole periodof 12 months of famine prevalence, the death-rate of 36·30 per mille may be compared with the mortality during the same period in 1893-94, when the provincial death-rate was 38·05 per mille.

The Government attaches much weight to these figures, because it can claim that in them will be found the proof that the relief organization of this famine has accomplished the object for which it was called into existence and the justification of the large expenditure which that organization has involved. That in the 12 months during which general famine and scarcity prevailed, along with the diseases which follow in their train, the death-rate should only have risen above the mean rate by 3·26 in every thousand of the population is a testimony to the success of the measures taken to secure that no section of the community should be without the means of subsistence. There can unfortunately be no doubt that some part of the abnormal mortality, however small it may have been, was due to disease induced by insufficient or unsuitable diet, and it would be rash to assert that no one during this year of trial perished from absolute want. Even this mortality would have been lessened, if not averted, had the victims roused themselves to seek or accept in time the relief which was accessible to all. The Sanitary Commissioner has thus described some of the causes which helped to swell the death-rate. Elsewhere in this narrative will be found some account of the difficulties experienced by relief officers in saving people in spite of themselves.

"Of deaths from real starvation I believe there were very few. Two factors, both very difficult to deal with, frequently operated in bringing about what might be termed an avoidable mortality. The first was the pertinacity with which the people clung to their homes even when relief works where established comparatively near. This was especially the case as regards the hill people in the south of Bundelkhand and the Allahabad district. Such people usually came on the works so reduced by chronic privation that they were unable to digest and assimilate food; and an ordinary meal often brought on dangerous, and even fatal diarrhœa. A second factor was the characteristic tendency to try and save a little money out of whatever they received. The Famine Code rations being based on what was required for fair subsistence, left little margin for such economies; and it was frequently found necessary to issue rations in lieu of wages to children and others, where the parents persisted in endeavouring to hoard up their trifling gains."

The number of deaths ascertained to be due to starvation have been recorded month by month. They amount in all to 25 deaths between September 1896 and October 1897. Each of these cases was investigated. In each the victim proved to be a wanderer, usually unknown, sometimes a migrant from some

Foreign State, who preferred a life of vagrant mendicancy and perished within reach of relief.

But though the relief measures, it may be claimed, succeeded in maintaining life, yet the reduced vitality of the people appears in the diminished birth-rate in the period which commenced nine months after the famine had set in. The statistics, set forth in full by the Sanitary Commissioner, show how the birth-rates in the distressed tracts fell off in 1897, reaching the portentously low level of ·75 per mille in Bánda in June—a sure indication of low physical condition in the previous October.

It is to be confidently anticipated that this low birth-rate will be continued throughout 1898, if not still later—a result for which some compensation is to be found in the increased provision which will thereby become available for fewer mouths. Thus the coming years should witness some improvement in the general physique and well-being of a population which will have lost in the infirm, the leprous, and diseased, but gained in well-nourished infants.

The Sanitary Commissioner draws particular attention to the small mortality from epidemic cholera usually so fatal among large collections of people and in communities reduced by privation. It is impossible to attribute this to any other cause than the extraordinary attention paid to sanitation and in particular to securing a pure water-supply on all relief works and in poorhouses. So far from these congregations of people proving centres for disease, it was often found that the disease originated in the villages and spread from them to the works. Where, in spite of the precautions detailed by the Sanitary Commissioner, cholera made its appearance, as it repeatedly did in certain districts, it was on each occasion successfully met by prompt transfer of the workers or poor-house inmates to another locality, by isolation of the infected gangs, and by the protection and disinfection of the new water-supply. Over and over again were outbreaks of cholera suppressed by these measures on the appearance of the first few cases—measures, it may be added, which were only possible and effective because, on prevision of the likelihood of disease, they were preconcerted by the local officers. The success so attained is due to the skill and devotion to duty in combating these epidemics, shown not only by the officers of the Sanitary and Medical Departments, but by officials of all classes, both European and native, who were concerned in the relief operations. In each outbreak a European officer was on the spot generally within a few hours, and remained till the necessary measures had been carried out and proved effective. Several of the staff, European and native, have lost their lives in the resolute discharge of this duty: the unprecedentedly small mortality among the workers is their best epitaph.

CHAPTER XIII.

Some reflections on measures of precaution against future Famines.

THIS being the first important famine which has visited these Provinces since the Famine Code was compiled in its present form, it was inevitable that alterations and modifications in various portions of the Code should be suggested by the new and very extended experience now gained. This narrative has touched more than once on circumstances which necessitated some new departure from the procedure or policy of the Code; and as these changes have been approved by results it is desirable that they should be embodied in the Code for future guidance. Steps have already been taken in this direction. In all matters of administrative policy or executive detail, then, the lessons of the famine will find their proper expression in a new and revised edition of the Code, and no further reference to them need be made in this place.

But there are other matters not of detail, but of larger moment, upon which the experience of the last two years has also thrown some light and suggested reflection. Some of them are matters which lie at the root of the prevention as well as the alleviation of famine, and in regard to them the Lieutenant-Governor desires to record some observations before bringing this narrative to its close.

In the forefront of all agencies which subserve the alleviation or prevention of famine stand Railways and Irrigation.

This narrative will have failed in its purpose if it has not made clear how large a part railways have played in recent years in the maintenance and distribution of the food supply, without which all the other relief measures would have been of no effect. The questions then naturally occur whether the experience of the famine period has shown any weak points in the railway system; whether any parts of the Provinces have been found insufficiently protected by railways; and if so, what is the order of urgency in which the protection should be supplied.

It cannot be said that the experience gained during the last two years calls for any substantial modification in the programme of railway construction which had been antecedently approved. So far as can now be seen, only three protective lines of railway, or rather the extension and linking up of existing lines, remain to be constructed: these are—

(1) the Ghāziabad-Moradabad-Rāmnagar line ... 150 miles.
(2) the Bareilly-Budaun-Soron line ... 60 „
(3) the Shikohabad-Mainpuri-Farukhabad line ... 80 „

The first of these will establish communication between the Rohilkhand and Kumaun Divisions and the great Railway systems which converge on Delhi. The portion of the line between Gháziabad and Moradabad will be of great use in developing the Meerut and Moradabad districts, and will tap important and fertile tracts of country. On the Moradabad side of the Ganges it will be a protective line, and on the Delhi side a much-needed collecting agency.

From Moradabad or some other suitable point of the existing systems to the important mart of Rámnagar at the fort of the Garhwál Hills, railway communication is very much wanted. Such a line would pass through a country hitherto unopened, while it will be of the utmost service to all the great extent of hill country which the existing sub-montane railways are quite unable to serve.

Communication in the Kumaun division is so difficult, and carriage so costly, that neither the railway from Najíbabad to Kotdwára, now completed, nor the railway to Káthgodám give any substantial help to the portions of Garhwál and Kumaun which would be supplied from Rámnagar. In the Himálayan districts, with a population fast growing in density and harvests entirely dependent on a rainfall which is not stable, imports of grain have of late years been often necessary to prevent or alleviate distress. This import is rendered expensive at any season of the year by the nature of the country to be traversed between the existing railway system and the marts at the foot of the hills, while in the rains it is almost impossible for the same reason. A railway line connecting Rámnagar with the existing system would therefore make a great difference in the price of grain to the natives of Garhwál and Kumaun.

The second extension mentioned would link up the narrow gauge systems on the north and south banks of the Ganges. It would have a high protective value on a large tract of country which caused anxiety this year, though the distress in it was much less than it was in the famine of 1877-78. The necessity of protection for this area will be recognised from the fact that, with a population of 400 to 500 to the square mile, only 7 per cent. of the crops are irrigated, and that the rainfall, which averages only 33 inches, is liable to much fluctuation.

The last railway project mentioned passes partly through a country protected by canals; but when it penetrates into the Farukhabad district, it traverses country which suffers from drought. The line, therefore, would be partly protective and partly distributive, and should be remunerative.

It is not considered necessary to enumerate among the railways, whose construction is needed, the various branches and extensions of the Bengal-North-Western system which have been recognised as necessary. These are the

nexus of lines intended to supply the doáb of the Ganges and Gandak, and to complete the connexion between North Behar and Gorakhpur. As it is understood that the necessity of these extensions is admitted, it is needless to dwell here upon their advantage.

When the railways now enumerated are completed, it may be fairly said that all the substantial wants of these Provinces in the way of railway communications will have been satisfied. Of course there will still remain a large field for steam tramways and perhaps light railways through the richest tracts, especially where irrigation assures a crop in all years. But these will be distributing and remunerative lines. They are not essential for protective purposes. On the whole, then, it may be said that but little remains to be done towards completing the compulsory railway programme for the United Provinces.

If the field for railway construction is gradually contracting, so also are the possibilities for the construction of useful and remunerative canals. It may be accepted as an established fact that when the Fatehpur Branch of the Lower Ganges Canal now under construction is completed and working, there will be no more water left for any considerable extension of the canal systems drawing their supplies from the Ganges and Jumna rivers. In the opinion of the Irrigation Department of this Government, the only sources of water-supply which will then remain to the Irrigation Engineer in these Provinces seem to be the following :—

Name of river.	Source and character of water-supply.
Sarda river	Snow fed: 6,000 cubic feet per second generally available.
Ken river	The Bundelkhand hills, which form the northerly and lowest terrace of the Vendhyan system.
Dhasan river	
Tons river (Allahabad)	Large, deep channels, with large flood volumes and low dry weather discharges; storage possible, with high weirs.
Rámganga river	
Small hill streams in Balrámpur, Gonda district, and possibly in Bahraich.	The outer Himálayas. Large flood volumes; low dry weather discharge.
Small hill streams in Gorakhpur and Basti.	
Small hill streams in Garhwál-Bhábar ...	
Small rivers in Bareilly district and neighbourhood.	

There are of course many more rivers in the plains of the North-Western Provinces and Oudh; but none has any considerable volume in years of drought, and the water level is generally too much below the surface of the country to allow of the construction of an economical canal.

The Sarda River project.—The Sarda river is the only river in the Provinces, after the Jumna and Ganges, which affords a sufficient and permanent supply of water: the construction of a canal system fed by it has for many years been under discussion, and several projects have been actually prepared. The original project for the Sarda canal, to cost about six crores, provided irrigation for all the Oudh districts (except

Kheri) lying between the Gogra and Ganges, and also for parts of the districts of Allahabad, Mirzapur, Benares, Jaunpur, and Azamgarh in the same doáb.

This project, however, was vehemently contested by the great talúqdárs and other landlords of Oudh, their substantial objections being that irrigation was not wanted in Oudh, that if introduced it would generate fevers; and that the intervention of the Canal official between them and their tenants would cause difficulties. In their opposition the landlords were supported by some influential and experienced officials. The opposition prevailed; and the project was dropped for a time. It was resuscitated in 1880, when drought threatened, and a modified estimate was prepared, which provided for the irrigation of the Gogra-Gumti doáb only, including the districts of Sitapur, Bara Banki, and Fyzabad and parts of Lucknow, Sultánpur, and Azamgarh. This project, which was estimated to cost 3¼ crores, was postponed indefinitely in 1883.

In October last year the failure of the crops threatened to be greater in Oudh than elsewhere, and the question of undertaking the Sarda canal as a relief work came again under discussion. The magnitude of the work, however, was so great, while the injury to the country, if a mistake were made, would be so far-reaching, that the Lieutenant-Governor decided not to enter on this great undertaking as a famine relief work without careful preliminary inquiry. But, in view of the possibility that the famine might continue for longer than a year, Sir Antony MacDonnell considered it desirable to come to some decision on the question whether a canal could be advantageously made or not. Accordingly Mr. M. King, Superintending Engineer, was deputed to enquire into the merits of the project, and he spent four months of the cold weather in doing so. Mr. King's report has not yet been finally considered; but it may here be said that, in his opinion, Sitapur, Hardoi, Lucknow, and Bara Banki are the only districts of Oudh into which canal irrigation could be profitably introduced. The facts to be deduced from Mr. King's report are, on the one hand, that the water-supply from the proposed canal would be for these four districts practically unlimited, that a canal could be made for about 4¼ crores, which would possibly return 5 per cent. on the outlay;* and that these districts would be protected from the effects of drought, their wealth greatly increased, and about 265 square miles of shallow tanks reclaimed for *rabi* cultivation.

*The question of return is very uncertain.

On the other hand, the report shows that there are serious, though probably not insuperable, difficulties attaching to the project, arising from the high spring level of subsoil water, nature of subsoil, and drainage. The construction of

the canal continues to be viewed with disfavour by a large, though a decreased, proportion of landowners and cultivators and there is some doubt whether adequate water-rates could be realized.

The matter is still under the Lieutenant-Governor's consideration; but the facts which have been established by Mr. King's inquiries show the prudence of the decision which rejected the work as a famine relief measure.

The Ken River project.—This project, which affects a portion of the Bánda district only, was prepared in 1876-77, and again examined in 1896, with the conclusion that it should not be taken up until the Betwa Canal had shown better results. Since then the Betwa Canal has irrigated about* 85,000 acres between September 1896 and February 1897; and as the Ken project seems likely to cost about the same as the Betwa Canal cost, but to give decidedly better results, it is the Lieutenant-Governor's intention to depute an officer next cold weather to revise the Ken project and bring it up to date. It might perhaps be carried out as a protective work for about 40 lakhs, and be capable of irrigating about 80,000 acres of spring crops, besides saving a considerable area of autumn crops if the rains fail in late August and September.

* Of this, 31,000 acres only got a first watering; but the crops were brought to maturity by timely rain.

The Dhasan River project.—The supply of the Dhasan (Hamírpur district) fails entirely in dry seasons, and reliance would therefore have to be chiefly placed on storage. Three projects were proposed in 1869, the most practicable of which provides for 600 cubic feet per second throughout the year, at a cost of 25 lakhs. In the case of a very dry season, however, the reservoir would be emptied by the end of March, as happens with the Betwa canal. Considerable additions to the estimate of 1869 will be required, and there is little doubt that it would cost as much as the Betwa or Ken, *i.e.* 40 lakhs. The project is a possible one, but not so good as the Ken river project.

The Tons River project.—A canal from the Tons river in the Allahabad district was prospected for, and some levels taken last cold weather. It would water a tract of some 96,000 acres (culturable area) south of the city and station of Allahabad. There is sufficient supply in the river to irrigate, with a little aid from storage, about half of this area in a dry spring season, besides giving help to the autumn crops if the rains ceased early. But the river, which is of the same character as the Betwa and Ken, is liable to very heavy floods, and the cost of the head works would probably be almost prohibitive considering the limited area commanded. The canal would not cost less than 25 lakhs.

The Rámganga River project.—Several projects were proposed about 1869 for a canal from the left bank of the Ganges, which was to assist one from the right bank of the Rámganga. There was also a project for a canal from the left bank of the latter river. These were for the irrigation of the Bareilly, Bijnor, Moradabad, and Budaun districts. They were finally abandoned in 1876 because (among other reasons) there is not sufficient water-supply at times for the existing Ganges canals; because the spring level is generally near the surface, and temporary wells can be made cheaply in many places; and because canals from the Rámganga would cost a very great deal in comparison with the results they would be likely to produce. From this it is apparent that the prospect of irrigation from the Rámganga is not hopeful.

There remain the possibilities of irrigation from small hill streams; but it is unnecessary to consider these in detail. Such irrigation, though beneficial to the lands served, must, without very costly reservoirs, always be on a small scale; moreover, the water level near the hills is generally near the surface; and the irrigation from these streams can have but slight effect on the general food supply, while it raises intricate questions of private rights which often militate against effective and prompt action.

It may be added, however, that this source of irrigation has not been neglected by Government, wherever it can control the course of the streams, as in the Kumaun Tarái. Even further away from the hills—as in some of the Rohilkhand districts—small rivers are more or less utilized for irrigation under Government control. From time to time a river is taken up and the system of irrigation improved; but, it is repeated, the improvement in this direction can only be in a small way.

To recapitulate. The Sarda scheme, which is one of great magnitude, has been lately enquired into and reported on, and is under consideration. The Ken project, costing about 40 lakhs, seems likely to be a useful protective work, and the estimate will now be brought up to date. The Dhasan project will be further examined should the construction of the Ken canal be put in hand. The Tons scheme is too expensive for the small area commanded. The Rámganga schemes give no promise of success. There are no other considerable sources of supply; but improvements and extensions, in a small way, will continue to be made in submontane tracts.

The preceding observations show that, in the Lieutenant-Governor's opinion, there is not, if the great Sarda canal scheme be excluded, much scope in these Provinces for further extensions of canals. Without prejudging the conclusion he may come to on a further careful and leisurely examination of the case, Sir Antony MacDonnell is not

sanguine that the Sarda project will be practicable. If not, then the best hope for an extension of irrigation lies in the construction of wells. Sufficient reference has already been made to the great benefit which in a single year has resulted even from temporary wells. From masonry wells, which command a perennial water-supply, the advantage is increas-ed manifold. It should be the declared policy of the Administration to promote the construction of those wells. The construction of them should be actively encouraged by the grant of liberal advances. It has been alleged in some quarters that the state of the law of landlord and tenant discourages the making of wells—of all agricultural improvements the most necessary and the most within the tenant's reach. This is a matter which calls for examination with a view to the removal of obstacles to investments of capital which cannot fail to be beneficial to both landlord and tenant.

During the last two years the incidence of the Government assessments of land revenue upon the cultivated area has constantly engaged the Lieutenant-Governor's attention. It has been stated in some quarters that the condition of the cultivator has been, of recent years, changed for the worse by reason of excessive increases in the Government revenue, and that his power of resisting the pressure of adverse seasons has been proportionately diminished. In the following chapter reasons will be given, based on the experience of the present and previous famines, in favour of the view that, generally speaking, in these Provinces the cultivator's power of resistance has not decreased within recent years, but has improved. Still it was desirable to ascertain whether, in the Bundelkhand region especially, the acuteness of the distress might not, to some extent, have been aggravated by local and exceptional circumstances connected with the land revenue assessment.

From the personal experience of settlement operations on a large scale which the Lieutenant-Governor has had since his assumption of office in these Provinces, he is satisfied that the principles upon which the Government share of the assets of landed property is assessed are reasonable and sound, and that the various settlement authorities in carrying these principles into effect act fully up to the spirit of their instructions. But it may have happened that settlements concluded several years ago, during the cycle of prosperity, have become harsh and onerous in the adverse seasons, which have recently visited the Provinces. It is with the view of ascertaining whether, in any particular locality, the assessments of the past have fallen out of harmony with existing conditions that the Lieutenant-Governor has directed a special inquiry to be made. This special inquiry is now being conducted in the Bundelkhand region. It will, if necessary, be extended to other tracts in which the famine has been most acute; and its objects will

be to discover what the exact condition of things is and whether within recent years there has been any agricultural depression which can be fairly attributed to other than merely climatic causes. Should this inquiry bring to light that the assets of landed property have seriously decreased, either permanently or owing to temporary causes, and that the Government demand presses heavily on any estates, then a suitable remedy will be applied.

Only one word more remains to be said in this brief summary of questions which have, during the recent relief operations, attracted the Lieutenant-Governor's attention. The lesson which, above all others, famine experience teaches is the necessity for timely preparation. It is impossible, therefore, to exaggerate the importance of maintaining, from year to year, a careful watch on the character of the seasons, on the nature of the harvests, and on the condition of the people. Opportunity for insisting on this matter was recently taken by the Government of these Provinces in connexion with an interesting note on agricultural depression recently submitted by the Director of Land Records and Agriculture. It is the practice for District Officers to submit annually reports regarding agricultural prosperity or deterioration which are or should be based on the facts recorded in the agricultural registers maintained by the local kanúngos or revenue supervisors. Commenting on the shortcomings of such reports, the Government made the following remarks:—

"It is desirable that steps should be taken to derive full advantage from the information that is contained in these reports, or that should be found in them if they were properly compiled. They should, in the opinion of the Lieutenant-Governor and Chief Commissioner, embody the experiences of the individual districts during the years to which they refer. The history of past years shows that the climatic conditions of the province vary considerably from year to year, and yet that all these variations have been generally experienced at some time or other within a cycle (the length of which has been differently estimated by various authorities), after which they repeat themselves. In other words, an accurate account of the agricultural condition of the province and its individual districts for that cyclical period will afford instances of all the various forms of depression affecting a district, either as a whole or in part, to which that district is ever likely to be subject. If, then, these records of the annual history of a district for the whole period of such a cycle of years be compiled with accuracy and intelligence, and so collated as to form a connected and intelligent account of the agricultural history of the district for that period, we should have for all time a valuable and useful guide for Government and for the district officials to the weak points in the agricultural prosperity of each district, and more especially regarding the manner, the extent, and the precise localities in which it is affected by climatic variations. With this object in view it is not sufficient that these records of a district's vicissitudes should be found in annual reports. They should be carefully examined by the Director of Agriculture; where from any cause they are defective, the defect should be rectified at once; the significance of the records of one year compared with its predecessors should be noted; and after every five years all the reports should be collated and

the inferences or results set forth in a clear light. Thus a manual of the agricultural conditions of each district might, in time, be compiled, which would be invaluable to Government and to all officers to whose charge the district is entrusted in future.

"The two great dangers to which the agriculture of this country is exposed are undoubtedly flood and drought. The evils resulting from either one of these calamities have the effect of blinding the observer for the time being to the disastrous effects of the other. There are in most districts portions in which floods are the more serious evil, and to which a dry year brings relief; there are other portions in which drought has the more serious effect for evil; and yet again other parts, such as the *bhur* tracts, which suffer almost equally from excesssive or from deficient rain. It is, on the other hand, fortunate that what is a serious evil in some portions of the province carries with it some compensating advantages in other parts. But with a careful and intelligent account of the effect of the climate on every district and its component parts, an account based on actual experience extending over a cycle of years, it is hardly possible that any climatic danger could overwhelm a district and take by surprise those who are responsible for its administration without their being prepared for the evils they would have to face and guided as to the measures they should take to counteract them."

It is believed that the adoption of the system indicated in the preceding extract will place a District Officer in a position to know well beforehand what he has to expect, and thus enable him to advise the Government as to the future, and to take these timely precautions which prevent surprise and thereby rob a famine of something of its terrors.

CHAPTER XIV.

General considerations regarding the condition of the people, and the power of resistance to distress displayed by them. Conclusion.

ALL inferences as to the economic condition of the Provinces must no doubt be qualified by the extent and effectiveness of the relief system; but discounting this, the belief may fairly be entertained that the agricultural classes were not without resources which enabled them to oppose on this occasion an unwonted resistance to an unprecedented pressure. For this belief many reasons can be given. In the first place, this famine period was free from that general lawlessness and disorder which characterzed the famines of the earlier part of the century. Without labouring a comparison or insisting on conclusions from statistics which are often too imperfect to admit positive conclusions, it may be said that the narratives which have been preserved of the earlier famines down to the famine of 1837-38*—both before and immediately after the introduction of British rule—leave no doubt as to the social conditions which prevailed at such times. Each story is one of rapine, plunder, and desolation: the strong preying on the weak, the effacement of law and order, and the wholesale abandonment by the people of the tracts of country in which famine existed. The contrast between the past and the present is wanting in minute detail; but the broad lines are clear and unmistakeable.

* The official record of this famine states as follows:—

"The beginning of trouble in 1837-38 was marked by a spirit of lawlessness and freebooting throughout the country. Neither the stores of the merchant nor the grain in transit was safe from attack. The starving people forgot all rights of possession, and violently laid their hands on their neighbours' supplies. In almost every district a larger police force had to be entertained, and this item added in no small degree to the burden of Government."

Again the history of the earlier famines shows them to have been invariably accompanied by migration on a large and organized scale from the distressed tracts. As soon as the crop failure and the exhaustion of food supply were declared, a movement of the population set in towards those parts of the country where either the information or the traditions of the people led them to expect that food and work could be found. Such records as exist of famines which occurred in the last century or in the early part of this century show that whole tracts of country were thus left desolate by the withdrawal of a large part of the population, and that the affected districts took years to recover from the loss of their population.

This feature of famine times was conspicuously noticed as late as 1837. In 1860-61, and again in 1868-69, extensive movements of the population were observed either in the

shape of migration from one part of the Provinces to another, or of emigration from the affected parts of these Provinces towards the country lying outside, or the immigration from Foreign States of people attracted either by the greater prosperity or by the existence of relief measures in this territory. Even in 1877 there was much migration and wandering of the people within the Provinces, and there was a very noticeable movement of emigrants from Native States into or through certain British districts. In strong contrast with this characteristic of previous famines was the entire absence during 1896-97 of any organized movement among the people, or even of desultory wandering on any noticeable scale.

The foregoing narrative has, indeed, shown that a substantial number of emigrants from Native States found their way to the relief works and poorhouses of parts of these Provinces; but even here there does not seem to have been any concerted or considerable movement of the population of these States. It is true that on this occasion there was no general failure of fodder, and therefore that incentive was wanting which leads pastoral or agricultural communities to wander in search of pasturage for their cattle. This, however, goes but a small way towards explaining the unusual stability displayed by the population on this occasion. A fuller explanation is to be found in the measures of Government which encouraged the people to settle quietly in their homes under the assurance that they would receive such protection and support as the resources of Government could extend to them. Undoubtedly this tranquillizing influence had very great effect; but with full consideration for all these exceptional circumstances, it is probable that, unless there had been some very substantial improvement in the economic conditions of the Provinces, the migrations in search of food and labour, which characterized earlier famines, must have been repeated, even though on a diminished scale.

Another argument in support of the growing substance and wealth of the people is to be found in the rapid recovery of agriculture, which characterizes recent famines. This recuperative power has been of gradual, not sudden, growth. In the absence of agricultural statistics it is impossible to formulate a precise comparison; but from such general accounts as exist some inferences may be drawn.

The contemporary accounts of the condition of the country show that the famines of 1783 and of 1803-4 were followed by waste and desolation, which ensued from the exhaustion of agricultural stock and agricultural labour.

Colonel Baird Smith, a competent investigator, has ascertained that—

"the famine of 1837 so affected the agricultural prosperity of the affected districts that the stamp of this terrible famine remained uneffaced in the

Agra division by the lapse of two-and-twenty years, and that the State received from that division less revenue by an aggregate amount of Rs. 1,32,85,000 than it would have done had it been possible by any expedients to have warded off the catastrophe."

In 1861 the recovery was more rapid, but the country affected in the North-Western Provinces (about 10,000 square miles) was comparatively small and the adjacent regions had good crops.

In 1868 these Provinces "felt only the fringe of the famine" and naturally soon recovered from its after effects.

In 1877 the famine, it is true, was not preceded by years of scarcity;* but the distress was severe while it lasted. Its effects were not so much manifested in the spring sowings, which followed it immediately under favourable conditions, as in the *kharíf* sowings of the following year. These showed a decrease of 3 per cent. under the normal cultivation. There was therefore some deterioration.

* "The seasons of 1874, 1875, and 1876 were favourable in the North-Western Provinces and Oudh, and the harvests of those years were considerably above the average. The stocks depleted by the drought of 1873 and the drain to Behar (in 1874) were thus replenished, and became abundant and cheap, prices being lower than they had been for more than 20 years."—*Indian Famine Commission's Report, page* 191.

It would be too early to attempt an estimate of the future effects on the Provinces of the trial, the severest within the century, through which they have just passed; but it is possible to observe the unprecedented rapidity with which agriculture is recovering as soon as natural conditions permitted its resumption. The great failure of the autumn harvest of 1896—itself preceded by several bad years—was succeeded in 1897 by a *rabi* which gave only 60 per cent. of a normal outturn. Yet there is, throughout the Provinces generally, no trace of the desolation and loss or deterioration of cultivation or exhaustion of agricultural labour which followed those earlier famines. On the contrary, the Director of Agriculture, reporting on the 9th November 1897, says—

"The area under the *kharíf* (autumn) harvest is now calculated to be 3½ per cent. above the normal, and there has been virtually no crop failure anywhere. The outturn is (with the exception of two doubtful districts) given as from 14 to 16 annas, and several District Officers go up to 17 and 18 annas. An exceptionally fine harvest has been secured over all the Provinces in an abnormally full area.

"The cane crop, as already mentioned, is above the average except in parts of Rohilkhand, where a 13 and 14-anna crop is estimated. For the *rabi* (spring) harvest it would be premature to make any forecast, though by all accounts a fully normal area is being sown."

This statement of the existing condition of agriculture goes to show that the people have resumed the usual tenor of their lives with energy, undemoralized by the hardships or the incidents of the preceding year. The only circumstance which has come to the Lieutenant-Governor's notice tending to suggest deterioration is the cultiva-

tion in certain tracts of a larger area with oil-seed instead of the more valuable wheat, owing to the dearness in the price of wheat for seed and the comparative cheapness of the oil-seed. But even this circumstance affects only the most distressed part of the Allahabad division and it needs confirmation : on the whole there would seem to be no substantial deterioration, and this fact would seem to indicate an improvement in the resources and in the resisting power of the population.

Any estimate of the economic effects of different famines is necessarily obscured by the success of relief measures in modifying or averting those effects. It is constantly necessary, therefore, in comparing the condition of the period during and after the present and past famines, to remember that relief was, upon the present occasion, distributed in a complete and effective form, for which no previous parallel can be found in these Provinces. What would have happened had relief measures not been initiated before distress appeared and developed as it expanded, must remain largely a matter of speculation. To this modifying influence the further qualification must be added, that modern improvements in communications and the canal irrigation have completely altered the economic conditions in these Provinces. Reference has already been made to the effects of the system of irrigation in protecting the country from drought and promoting cultivation. The influence of improved communications has been even more important and more general. Railways have opened new markets, made the surplus of one region available to supply the deficiency of another and stimulated the cultivation of more valuable staples. Cultivators have obtained a certain market and an enhanced and stable price for their produce. Grain which, in seasons of plenty, used to rot in the fields or perish by waste or deterioration before it could be consumed, has become a profit to the producer and an addition to the general resources of the country, in which more of it seems to be consumed than used to be the case or than can be attributed to the mere growth of population. Ignorant or short-sighted alarmists find in these movements of trade proof that the resources of the country are being dangerously exhausted by the new facilities for carriage. The experience of this famine—a famine of slow growth, wide extension, and great severity, and therefore a crucial test of the subject under notice—has shown that large stocks of food are still kept in reserve in accordance with immemorial practice, and that the same facilities which permit the export of a surplus enable the consumers in times of scarcity to supply deficiency by import.

All observers are combined in thinking that the high prices of recent years, together with the increased facilities for transport, have enabled the cultivating classes to derive much profit by the sale of their surplus produce. This has

added to their wealth, and enabled them to improve their general standard of living. How long this improvement will last, how long the surplus which makes it possible will continue to be produced, depends on the growth of population, the progress of agricultural improvement; the maintenance of moderate taxation, and finally on the advance of general enlightenment. Into speculations on these interesting subjects the Lieutenant-Governor will not now enter; but he has faith in the future, in the people, and in the equity and resourcefulness of British statesmanship.

But, if we may hopefully regard the prospects of agriculture in these Provinces, there is another and a less pleasing aspect of the case. Beyond the cultivating classes there is a large and growing section of the community who subsist by day labour, whose wages have not generally risen with the rise in prices. It would be incorrect to say that this class has appreciably shared that improvement which the cultivating classes owe to extended irrigation, better communications, and higher prices.

During the present famine the vast bulk of the recipients of relief were persons of the labouring class. Cultivators or their families were found in fewer numbers upon relief works, and scarcely ever entered the poorhouses. Even the gratuitous village relief was very largely bestowed on the helpless families of day labourers and artizans. The form in which pressure upon the cultivating classes chiefly manifested itself was in the unusual share which they themselves and their families took in field work, for which they had been accustomed to employ hired labour. In those districts which escaped crop failure the pressure fell almost exclusively upon the town population, to whom the high prices of agricultural produce brought only distress. Yet even in such tracts the general prosperity which prevailed enabled such classes, largely artizans, to find employment and subsistence without recourse to State or charitable relief.

The general conclusion, then, which the Lieutenant-Governor is disposed to draw is that the cultivating classes, whether tenants or proprietors, have displayed in this famine a command of resources, either in the shape of capital or credit, and a power of resistance, which have not been paralleled in any previous period of scarcity; but that this improvement has not been materially shared by the labouring classes. The labouring classes would probably have suffered more severely than before but for the extensive and elaborate measures organized by Government to assist them.

Perhaps some encouragment for the future may be found in a movement, which has set in, of labour from the congested districts in the eastern part of the Provinces towards Assam and Eastern Bengal, which have become accessible by

the extension of railways. If relief is not found in emigration of this sort it is difficult to see from what direction relief is to come. For industrial enterprises are of slow growth, while the waste tracts within the Provinces suitable for cultivation are no longer considerable, and further extensions of canal irrigation are limited by the appropriation of all the chief sources of water-supply.

CONCLUSION.

THE story of the famine has now been told. The foregoing narrative has explained how the disasters of four successive years so reduced the resources of the people that in the worst afflicted tracts famine asserted itself in the summer of 1896: it describes how the failure of the rains in 1896 intensified that famine, and extended it over large tracts that had so far struggled against the adversities of the seasons: it sketches the organization created to bring relief in suitable shape to all classes of the famine-stricken population: it tells how the famine grew in extent and acuteness through the winter months of 1896-97, and how the relief was developed to meet the increasing distress: how the spring harvest of 1897 lightened the pressure in all but the worst districts, and how the advent of the rains brought about new conditions favourable to the people, but necessitating new dispositions to meet them: it shows how the pressure slowly relaxed as the field of agricultural labour reopened with the progress of the rains, and how it disappeared as a bountiful autumn harvest replenished the food stores of the Provinces and rendered it possible to wind up by cautious steps the various relief measures which had for many weary months been the sole resource of hundreds of thousands of destitute people. The operations of the Department of Public Works have been described with the necessary technical detail, and the other agencies which co-operated in the work of relief have been portrayed and their results exhibited. The question of prices and food supply has been examined; the movement of crime has been measured, and the law-abiding character of the great mass of the people has been acknowledged; the possible extensions of the Railway and irrigation system have been glanced at, and the need of preparation and foresight in connection with seasonal changes and agricultural gain and loss has been adverted to.

Some effort has been made to illustrate the social and economical condition of the people, their resources and their power of resistance to natural calamities, by comparison with previous famines and their consequences to the community; and, finally, the state of public health during the famine period has been stated and cited as the test and crown of the great and complex organization whose object was to preserve human life.

The statistical results of the various forms which the relief measures took have been duly exhibited, and it is not necessary to repeat them here in detail. But by way of final summary it may be said that the famine and scarcity extended with various degrees of intensity over an area of more than 72,500 square miles with a population of 34½ millions. Beyond this lay an area, co-extensive with the Provinces, within which the pressure of high prices fell heavily on all, and particularly on the labouring classes.

The relief measures, which commenced in Bundelkhand in March 1896, continued till the middle of October 1897. The number of persons who received support for one day amounted to 304 millions of people in round numbers, or if the relief given from the Indian Charitable Relief Fund be included to about 334 millions, a total which is nearly equal to the population of the United Kingdom, of India and the Colonies.* This is equivalent to a daily average of 1,688,000 persons supported for six months. The cost to the State (all charges included) amounts to two crores and 17 lakhs of rupees or £1,400,000 at the present rate of exchange. Each person supported represents a daily charge to the revenues of 13 pies or ·07 of a rupee.

*The Statesman's Year-Book for 1897 gives the population of the United Kingdom of India and the Colonies as 347,278,469.

The indirect loss in the remission of land revenue has been already stated at 60 lakhs of rupees. The famine has also had injurious effects in various other sources of revenue, such as Excise, Stamps, and Income Tax. It will not be possible to state the loss in these departments until the year's accounts are balanced; but the probability is that it will be covered by about 25 lakhs.

Thus the direct and indirect cost of the Famines of 1896 and 1897 to the Government of India may be put at about three crores of rupees, or two million pounds sterling at current rates of exchange.

In 1896 the death-rate for the United Provinces was 33·32, and for the 12 months—October 1896 to September 1897—during which the famine prevailed, the rate was 36·30 per thousand of the population. The similar rate for the previous decennial period was 33·04.

In these few figures is concentrated the history of a series of great calamities mitigated by efforts which taxed all the resources of the Government and all the energy, skill, and devotion of its officers. They represent much suffering borne with submissive patience and quiet endurance by the people, and great difficulties overcome, under Providence, by the unwearying toil, the humanity, and the patient resolution of a great body of workers.

It is, perhaps, too soon to make a proper estimate of the political effect of the measures by which Government

exerted itself to save its subjects from the effects of this famine. Some officers report that there are no noticeable manifestations of gratitude. Other officers, and these not the least observant, give an entirely different opinion, and say that the feeling of gratitude is deep and widespread among all classes. An observant European officer, noticing the confidence with which the children, at first timid, now meet advances, writes as follows: "The utter confidence of the children" (in the Government official) "is a curious and very touching thing to see. Young "lads and children have keen ears and close memories. Their "looks and manners are the surest indication of what "kind of pictures their parents paint in their home talk. The "pictures must be in warm and glowing colours."

A most trustworthy native officer says that in his district the feeling of the people finds expression in the saying that the *Sarkár* has saved them from ruin like that of a *Bharat*. A *Bharat* is that war of universal desolation which is familiarized to the Hindu mind by the great Hindu epic.

It has already been noticed that the ballads of the *Holi* festival, last March, sang, in rude verse, the story of the bountiful charity that was being then dispensed. The songs of the people disclose their thoughts.

The Lieutenant-Governor believes that the relief operations now closed have inspired a feeling of gratitude and confidence; and his hope is that this feeling will grow and endure when the vicissitudes of the struggle are over and the return of prosperity allows the people to fully realize the nature and extent of the efforts made in their behalf during the time of the trial. Of all the measures by which relief was conveyed to those who needed it, the one which most profoundly impressed the people was the system of gratuitous outdoor relief. Outdoor relief at the homes of the people did not merely preserve life and mitigate those material hardships which are inseparable from other forms of relief. It also respected those customs, feelings, and prejudices—half estimable, half pitiful—which are often dearer than life itself to those whom Government undertook to protect. The people were struck both by the benevolence of the motives which inspired this kind of relief, the generosity with which it sought no return, and the immense and elaborate organization created to administer it. They found in it a type and a proof both of the power and resources of the Government and of its humane care for even the feeblest of its subjects.

The very magnitude of the relief operations would make them impressive.

A two-fold duty alone remains for the Lieutenant-Governor to discharge. One is to express the grateful acknowledgments of this Government to the Governor-General in

Council for the constant encouragement, consideration, and support which he has accorded to it in the fulfilment of its task. The second duty is to place on record this Government's appreciation of the services which have secured the success of relief measures during this memorable year. It is difficult for the Lieutenant-Governor and Chief Commissioner to express his sense of the greatness of these services; but he has endeavoured in a separate proceeding to set forth the names and services of those officers of Government and private gentlemen to whom he is most beholden for sustained and effective work. When almost every officer of Government, each in his own grade and sphere, has rendered good service, it is not an easy task, nor one free from suspicion of invidiousness, to single out individuals for special mention. But the excessive severity of the distress in particular districts threw upon the officers posted there an enhanced degree of responsibility and an increased burden of hard work which did not fall to the share of their colleagues in other districts. The officers, thus tried by circumstances of the greatest difficulty and danger, have exhibited a zeal, self-sacrifice, and resourcefulness in meeting difficulties, which have been worthy of the best traditions of their services; and the Lieutenant-Governor tenders to them his special thanks. The most prominent are—

Of the Civil Service of India—

Mr. A. W. Cruickshank, Commissioner, Allahabad Division.

„ H. C. Ferard, Collector of Bánda.

„ D. Calnan, Collector of Jalaun.

Of the Public Works Department—

Mr. C. G. Palmer, Superintending Engineer, Allahabad Division.

Colonel R. R. Pulford, C.I.E., R.E., Superintending Engineer in Oudh.

Of the Medical Department—

Surgeon-Lieutenant-Colonel Thomson, Sanitary Commissioner.

The Lieutenant-Governor desires also to mention in this place the name of Mr. C. W. Odling, the Chief Engineer and Secretary to Government, who during the two famines powerfully contributed to the success of the operations of the Department of Public Works which, under the orders of Government, he directed.

Among the many non-official workers in the great charitable field, the Lieutenant-Governor would take the liberty of specially mentioning the name of Miss Hewlett of the London Mission, whose self-sacrificing labours among the poor at Mirzapur attracted his particular attention.

The names of the native noblemen and gentlemen who have helped the Administration by active personal assistance or in other ways have been recorded with suitable

acknowledgments in a separate minute; but here the Lieutenant-Governor desires to acknowledge the great benevolence displayed during the year by His Highness the Mahárája of Benares.

ORDER.—Ordered that a copy of this Resolution be submitted to the Government of India, Revenue and Agricultural (Famine) Department.

Ordered also that a copy be published in the *Government Gazette*, North-Western Provinces and Oudh, for general information.

T. STOKER,

Secretary to Govt., N.-W. P. and Oudh.

SALE OF GOVERNMENT PUBLICATIONS.

The under-mentioned Firms have been appointed sole Agents for the sale of Government Publications, including Parliamentary Reports and Papers, Acts of Parliament, Record Office Publications, &c., &c., and all such works can be purchased from them either directly or through retail booksellers, who, under the provisions of the sale agency contracts, are entitled to a discount of 25 per cent. from the selling prices :—

IN ENGLAND :—

For all publications *excepting* Ordnance and Geological Maps, the Hydrographical Works of the Admiralty, and Patent Office Publications :—MESSRS. EYRE AND SPOTTISWOODE, East Harding Street, E.C.

For Geological Maps :—Mr. E. STANFORD, Cockspur Street, S.W.

For Hydrographical Works of the Admiralty :—Mr. J. D. POTTER, 31, Poultry, E.C.

Patent Office Publications are sold at the Patent Office.

For all publications *excepting* the Hydrographical Works of the Admiralty and Patent Office Publications.

IN SCOTLAND :—MESSRS. JOHN MENZIES & Co., 12, Hanover Street, Edinburgh, and 90, West Nile Street, Glasgow.

IN IRELAND :—MESSRS. HODGES, FIGGIS, & Co., LIMITED, 104, Grafton Street, Dublin.

The following is a list of some of the more important Parliamentary and Official Publications recently issued :—

Parliamentary :

Statutes—

Public General, Session 1897. With Index, Tables, &c., &c. Roy. 8vo. Cloth. Price 3*s.*

Second Revised Edition. By authority. Vol. I. A.D. 1235–1713. Vol. II. A.D. 1714–1800. Vol. III. A.D. 1801–1814. Vol. IV. A.D. 1814–1830. Vol. V. A.D. 1830–1836. Vol. VI. A.D. 1837–1842. Vol. VII. A.D. 1843–1846. Vol. VIII. A.D. 1847–1852. Vol. IX. A.D. 1852–1857. Vol. X. A.D. 1858–1862. Vol. XI. A.D. 1863–1867. Vol. XII. A.D. 1868–1871. Price 7*s.* 6*d.* each.

Revised Editions. Tables showing subsequent Repeals, effected by Acts of 60 & 61 Vict. 1897. Price 6*d.*

Statutes in Force. Chronological Table of and Index to. Thirteenth Edition. To the end of 58 & 59 Vict. 2 vols. Roy. 8vo. Price 10*s.* 6*d.*

The Statutory Rules and Orders revised. Statutory Rules and Orders, other than those of a local, personal, or temporary character, issued prior to 1890, and now in force. Vols. I. to VIII. Price 10*s.* each.

Statutory Rules and Orders other than those of a Local, Personal, or Temporary Character. With a List of the more important Statutory Orders of a Local Character arranged in classes; and an Index. Roy. 8vo. Boards. Issued in the years 1890, 1891, 1892, 1893, 1894, 1895, and 1896. Price 10*s.* each.

Statutory Rules and Orders in force on 1st January 1893. Index to. Imp. 8vo. Cloth. Price 10*s.*

Statutory Rules and Orders, 1898. Registered under the Rules Publication Act, 1893. In course of issue.

Acts of Parliament, Public and Local and Private, Session 1897, are now published.

[C. 8667.] CURRENCY. Proposals made by the United States on, Correspondence respecting. Price 2½*d.*

[C. 8698.] EXPLOSIVES. Testing Coal Mines. Report of Departmental Committee on. Price 8*d.*

[C. 8732.] BRITISH SOUTH AFRICA COMPANY'S TERRITORIES. Correspondence relating to the proposed Changes in the Administration. Price 2*d.*

[C. 8733.] BRITISH INDIA. Trade of, for five years, 1892-93 to 1896-97. Price 11*d.*

[C. 8734.] LAND ACTS AND LAND PURCHASE ACTS (IRELAND). Report of the Royal Commissioners of the working of. Price 4*d.*

[C. 8761.] PUPIL TEACHER SYSTEM. Report of Departmental Committee on. Vol. I. Price 8*d.*

[C. 8762.] Ditto. Vol. II. Evidence with Index. Price 4*s.* 3*d.*

[C. 8768.] TELEPHONE EXCHANGE. Service in Glasgow. Report of an Inquiry. Price 2½*d.*

H.C., No. 129. 1898. Life Assurance Companies. Statement of Account for the year 1897. Price 2*s.* 2½*d.*

H.C., No. 376. 1897. FOREIGN IMPORT DUTIES in force January 1898. Returns of. Price 1*s.* 9*d.*

MINES. Reports of Her Majesty's Inspectors for the Year 1896, with Summaries of the Statistical portion under the provisions of the Coal Mines Regulation Act, 1887; Metalliferous Mines Regulation Acts, 1872-1875; Slate Mines (Gunpowder) Act, 1882, Districts Nos. 1 to 13 (complete). Price 6*s.* 2*d.*

MINES in the United Kingdom of Great Britain and Ireland and the Isle of Man. List of, for 1896. Price 2*s.* 11*d.*

QUARRIES. Do. do. do. Do. Price 3*s.*

MINES ABANDONED. List of the Plans of. Corrected to 31st December 1896. Price 9*d.*

The following appear periodically, and can be subscribed for :—

TRADE OF THE UNITED KINGDOM WITH BRITISH POSSESSIONS AND FOREIGN COUNTRIES, showing the Quantities and the Declared Value of the Articles.

TRADE REPORTS of the British Colonies, with information relative to population and general condition.

TRADE REPORTS by Her Majesty's Representatives in Foreign Countries, and Reports on Commercial and General Interests.

The Proceedings of Parliament in public and private business, published daily. House of Lords, Price 1*d.* per 4 pp.; House of Commons, 1*d.* per 8 pp.

State Trials, being Reports of the Chief State Trials which have taken place between 1820 and the present time, published under the supervision of a Committee appointed by the Lord Chancellor :—

Roy. 8vo. Half cloth. Vol. I. 1820–1823. Vol. II. 1823–1831. Vol III. 1831–1840. Vol. IV. 1839–1843. Vol. V. 1843–1844. Vol. VI. 1844–1848. Vol. VII. 1848–1850. Price 10*s.* each.

NARRATIVE OF THE FAMINE OF 1896–97.

1. The account given in these pages of the famine of 1896-97 has no claim to be more than an imperfect sketch put together from incomplete and scattered materials. For a complete review of the subject the reports of the Provincial Governments are required, and some time must elapse before all of these are ready. Famine operations have nearly closed in Bengal, the North-Western Provinces and the Punjab. But in the Central Provinces the relief of distress still occupies the energies of the local administration, notwithstanding that agricultural prospects there are excellent; while in Madras, Bombay, and Burma the protraction of the period of drought till the end of August makes it at present difficult to say when relief operations there will completely terminate. It is thought that a general account of the famine will be of some interest while its events are still fresh, and that a detailed discussion of the measures undertaken to combat it and of the questions of administrative policy which arose from time to time during the progress of these measures may be postponed until more complete information is available.

I.—The cause of the famine.

2. The cause of the famine of 1897 was the early cessation of the autumn rains of 1896. The south-west monsoon was late in establishing itself in June 1896 on the West Coast, and from its first appearance was ill-distributed and fitful in character. Throughout July the rainfall was more or less deficient in Bengal and Central and Northern India, and gave rise to apprehensions. In August the monsoon appeared to have recovered strength, and frequent cyclonic storms gave heavy rain to the Central Provinces, Central India, and Rajputana. Elsewhere in Upper India the rainfall was in defect. Early in September the hopes of an improving monsoon were disappointed. The rainfall was in large defect over by far the greatest part of India, and was in excess only in East and North Bengal, South India, and Lower Burma. During this month irretrievable injury was sustained by the rain crops. In the North-Western Provinces and Oudh the average rainfall in September is from 5 to 8 inches, being lowest in the west and highest in the east. In September 1896 no division of the provinces received more than 1 inch, and in most the fall was considerably less. In the Punjab the fall was under half an inch, except in the north and the hill divisions, against an average of 3 to 5 inches. In the Central Provinces less than half an inch fell in the western and central tracks where the average September rainfall exceeds eight inches. Berar received ·38 of an inch against an average of 6·23 inches. The fall in Rajputana and Central India was equally small. In the Bombay Deccan 1·20 inches fell against an average of 5·53 inches, and in Khandesh ·96 of an inch against 7 inches. In the Madras Deccan the fall varied from 1 to 2 inches against an average of 5 inches. In Bengal and Behar the defect was less, and but for the cessation of the south-west monsoon early in the following month this part of India would have escaped without serious damage. In October virtually no rain fell in the Punjab, the North-Western Provinces and Oudh, Rajputana, Central India, the Central Provinces, or Berar. In the Bombay and Madras Deccan from $\frac{1}{4}$ to 1 inch fell in place of the normal rainfall of 4 to 6 inches. This following the protracted drought of September completed the ruin of the crops over vast areas, and made sowings for the cold weather crops almost impossible without the help of irrigation. In Bengal the October rainfall is in ordinary years larger in amount and of even more importance, on account of the late rice crop, than in Upper India. In most divisions in Bengal proper the average fall in October is from 4 to 6 inches: and in Behar nearly 3 inches. In October 1896 Behar was rainless, and throughout Bengal proper the fall in most divisions was under 1 inch. Orissa received ·09 of an inch against an average of 5·85. The late or winter rice crop, representing half the total cropped area of the Province, sustained great injury. In many places three-quarters of the crop was lost. For the whole of Bengal, Orissa and Behar

15238—875—12/97 Wt 18691 D & S 6

the yield of the rice crop is returned at 9½ million tons against 20½ millions, a loss of more than half the crop.

The early withdrawal of a weak south-west monsoon was followed by a still weaker north-east monsoon, on which the eastern and central districts of Madras chiefly depend. In the central districts only ·36 of an inch fell in October against an average of 5·21 inches; and along the East Coast the deficiency was still greater.

3. Thus the month of October closed with the entire Indian continent face to face with the most wide-spread failure of the rains and the gravest impending famine of the century. From this extreme peril it was rescued by most opportune and unlooked for rain in the succeeding month.

4. In the first week of November scattered showers fell in the Punjab and Southern India, which were followed by continuous heavy rain over the central and southern divisions of Madras. In the middle of the month there was good rain in the Bombay Presidency, and this extended to the Central Provinces, Berar, Mysore, Hyderabad, the North-Western Provinces and Oudh, Central India and Rajputana, Behar and Bengal. Outside the Madras Presidency and the Bombay Deccan the amount of rain registered in most tracts was under 1 inch, but it enabled cold weather crops to be very largely sown on unirrigated lands with fair hope of the seed germinating. In the Bombay Deccan considerably over 1 inch of rain fell, in Mysore over 2½ inches. Thus the effect of the November rain was to confine serious crop-failure in the Bombay and Madras Presidencies to the relatively small and sparsely populated area of the Deccan districts, and to secure a cold weather crop in Central and Upper India—scanty in extent, it is true, and sown under unfavourable conditions, but still sufficient to very materially supplement the depleted stocks of the country. From November the scarcity, though serious, shrank within measurable dimensions.

5. The month of December was as abnormally wet as November. Fairly general rain in moderate amounts, aggregating about 1 inch or less, was recorded during the month in most provinces, enabling sowings to be carried on to the end of the year and greatly benefiting the crops already sown. In the Deccan country and in the Nizam's Dominions the falls were very slight, and in this part of India the crops sown after the November rain as a rule absolutely failed. But elsewhere the month closed with better prospects for the sown lands than were thought possible in October.

6. These prospects were maintained by light to moderate rain in many parts of Upper and Central India during January and February. In the latter part of February and the beginning of March hot winds did a good deal of damage to the crops on unirrigated lands, and anxiety was felt lest they should be completely dried up before maturity. But in the middle of March the approach of the hot weather was arrested by frequent storms. Rain fell in good quantities in North Behar, Central and Upper India, greatly benefiting the ripening cold weather crops and permitting extra crops of early millet to be sown in many places. The Bombay and Madras Deccan continued rainless.

7. In April the cold weather crops were reaped in Behar, the North-Western Provinces and Oudh, the Central Provinces and the Southern Punjab, and agricultural operations throughout the greater part of India ceased for the time, and the absence or presence of rain became of little consequence. In the North Punjab, where the cold weather harvest is later, good rain fell during the month and improved the crops.

8. With April the second period of the scarcity may be said to have closed, as the first period may be said to have closed in October. With May another agricultural year opened, and another phase of the situation commenced. The month was favourable for Bengal and Lower Burma. Southerly winds from the Bay gave good rain in these parts and sowings of early rain crops commenced. But no advance of the south-west monsoon was reported in Southern India, and the first week of June passed before it appeared on the Ceylon coast. In the middle of June more favourable conditions appeared. Rain was received throughout India, and the monsoon winds blew strongly on the west coast and

across Central India. But this strength was of short duration. In the second half of the month the rainfall everywhere fell off, hot winds began to blow, and hot weather conditions seemed to be re-established. This period of great anxiety lasted into July. In the first week of July a marked improvement occurred, and by the middle of the month ordinary monsoon conditions were established in Upper India, though the rainfall was light and the Bombay and Madras Deccan received only scattered showers. At the end of the month conditions still further improved, and during August heavy continuous rain fell in Bengal, the Central Provinces, the North Western Provinces and Oudh, the west coast districts of Bombay, Rajputana and Central India, extending in the middle of the month to the Punjab.

9. September opened with excellent agricultural prospects in every part of India excepting in the "dry zone" districts of Upper Burma, the Deccan districts of Madras and Bombay, and portions of the Nizam's dominions. During the first fortnight of the month good rain fell in these excepted areas and agricultural prospects greatly improved. Such of the early sown rain crops as had escaped the drought revived, and sowings for the later crop have been vigorously prosecuted. Over much of the Deccan, specially in the heavy "black soil" tracts a very large area is not sown even in ordinary years until the heavy rains of August and September. There is thus still time for the Deccan by means of a late harvest to retrieve its fortunes, though the return to lower prices and abundant food supplies will be postponed, and relief will have to be administered for a longer period than was anticipated. Elsewhere the September rains have been favourable, assuring not only the fast ripening autumn harvest but also successful sowings for the cold weather crops. The disappearance of famine is now a question merely of weeks.

II.—The areas and populations affected.

10. It is impossible to exhibit in a statistical form with any approach to accuracy the areas affected by the almost universal drought and failure of crops which occurred in 1896-97. If the extreme south of the Peninsula and Lower Burma and such exceptional tracts as the Meerut Division in the North-Western Provinces, the Chenab irrigation colonies in the Punjab, and Sindh be excluded, a bad or indifferent autumn harvest and short sowings for the cold weather crops were chronicled almost everywhere. Where the deficiency was not very great and where past harvests had been bounteous, the agricultural classes have passed through the ordeal with tolerable ease, and in exceptional cases have actually been gainers by the high prices which their surplus grain-stocks have commanded. But everywhere the stress of high prices has been felt by the urban population, by the landless farm-labourers in rural tracts, and generally by all persons in receipt of small fixed incomes. The figures given below which have been compiled from the monthly famine reports of Provincial Governments and Native States refer to those areas only in which distress was so general and pronounced as to require relief operations to be undertaken by the State. In many cases these areas comprise fractions of a "district," the ordinary unit of Indian administration. One-half of a district may have been able to weather the storm without relief works or poor houses and with only such assistance as is afforded to the agricultural classes by temporary suspensions of the land-revenue demand ; while the other half, through greater deficiency of rainfall or absence of irrigation or peculiarities of crops, has required the relief provisions of the Famine Code to be brought into effect. The division into distressed and non-distressed tracts is thus in a measure arbitrary, and the statistical result is to narrow the area affected by the drought. The distinction between severely and slightly distressed tracts is also an uncertain one, and the table below does not pretend to accuracy in this respect. It has more than once happened that a district has passed during the scarcity from the slightly affected to the severely distressed state, and back again to the former class on the harvesting of the cold weather crops. There is no clear criterion of this distinction, and more often than not the distinction is ignored in the provincial returns. In the observations which follow the table an endeavour is made to indicate, so far as the information permits, the areas in which acute or severe distress prevailed.

I.—British India.

GRAND TOTAL ...	504,490	96,931,000	276,500	52,698,000

Madras.

11. In the Madras Presidency two distinct areas were affected—the Deccan, and the northern districts on the East Coast known as the Circars. In the Deccan distress was severe over approximately one-half of the Kurnool, Bellary, Anantapur and Cuddapah districts which have an area of 27,106 square miles and a population of 3,700,000. The distressed portion was described in November 1896

by the Madras Famine Commissioner as "a broad band occupying the north-western part of Cuddapah, the taluks of Kurnool immediately adjoining to the north, the northern half of Anantapur and the eastern half of Bellary with some parts of Kurnool adjoining. This tract largely consists of stiff "black cotton" soils which are not usually sown till September, and which in 1896, in consequence of the failure of the September and October rains, were either left unsown or yielded but a scanty crop. The rest of these four Deccan districts also suffered from the defective rainfall of 1896, but owing partly to the predominance of lighter soils and partly to receiving larger amounts of rain, the harvests there were better. In the Circars relief measures have been undertaken over scattered areas aggregating 8,600 square miles with a population of 3,000,000. In these tracts distress was later in declaring itself and was throughout sporadic in type, and the numbers on relief have been relatively small. Employing the terminology of the Famine Commission the distress in the Deccan has been classed as severe and in the Circars as slight.

Bombay.

12. The whole of the Bombay Presidency (excluding Sind) suffered from the premature cessation of the south-west monsoon of 1896, and everywhere a bad or indifferent autumn harvest and short sowings of the cold weather crops were reported. But actual distress was confined to the belt of country lying above the western ghats and comprising the Deccan and South Mahratta districts. The area classified as severely distressed includes the whole of the Bijapur, Sholapur, Ahmednagar and Nasik districts, four-fifths of the Satara district, one-half of the Poona district, one-third of the Belgaum district, and scattered portions of the Khandesh district. The rest (9,000 square miles) of the Khandesh district is shown as slightly distressed. Of the distressed districts the most severely and generally afflicted was Bijapur. In it the autumn harvests absolutely failed over the whole district, and very little land was sown with cold weather crops. In Sholapur the crop-failure on unirrigated lands was equally complete, but in places there is a fair amount of tank and well irrigation which was utilised to the full. In Ahmednagar and Nasik the western portions suffered less than the eastern, and distress was less general and less acute than in Bijapur or Sholapur. In the portion of the Poona district classed as distressed distress was undoubtedly severe. In Satara, Belgaum and Khandesh relief has been confined within relatively small limits.

Bengal.

13. In Bengal the severely distressed area is shown as 26,000 square miles with a population of 11,200,000, but relief operations on a large scale were confined to 11,466 square miles and a population of 7,552,000 in the densely populated province of Behar. Of the remaining area 10,035 square miles with a population of 1,787,000 lay in the hilly and sparsely populated division of Chota Nagpur, the indigenous races of which were exposed to a certain amount of privation from failure of crops and high prices, but succeeded in maintaining themselves without general resort to the relief offered to them. In the Presidency Division portions of the Nuddea, Khulna, and Murshidabad districts, with an aggregate area of 1,568 square miles and a population of 849,000; in the Bhagalpur Division portions of the Bhagalpur district and of the Sonthal Parganas, with an area of 1,921 square miles and a population of 702,000; and in the Orissa Division a small tract in the Puri District, required a limited amount of relief. The effect of high prices and the great deficiency in the rice crop were felt more or less severely throughout the province, and test works were opened from time to time in several other districts. But as they failed to attract workers, the people had presumably larger resources than was imagined. No exceptional mortality, it may be remarked, occurred in Bengal. Even in Behar, in parts of which severe distress prevailed, the death-rate has been normal throughout the year.

The North-Western Provinces and Oudh.

14. In the North-Western Provinces and Oudh, the severely distressed area is shown as 35,000 square miles with a population of 14,000,000, and the slightly distressed area as 16,000 square miles with a population of 9,000,000. The only portions of the province where relief operations were not required were the Meerut Division in the west, the hill districts of the Kumaun Division, and the districts of Ghazipur and Bahraich in the East. But even in these tracts the harvests were

below the average. In two well marked areas distress was exceptionally severe. The first included the districts of Banda, Jalaun, Hamirpur, Jhansi, Allahabad (part), lying south of the Jumna, and known as the Bundelkhand districts of the Allahabad Division. This tract is geographically part of the rugged hill country of Central India. With a precarious rainfall, few facilities for irrigation, a poor and unskilful population, and indifferent methods of agriculture, these districts have often been visited by famine. They had passed through one such year when the rains of 1896 failed. Judged by the extent of crop-failure and by the complete exhaustion of the resources of the people, the recent famine equals in intensity any previous famine in this region. The second area of severe famine included central and southern Oudh, distress being exceptionally severe in the district of Hardoi. Outside these two areas there was severe distress in the Azamgarh and Gorakhpur districts in the east which border on Behar, and in the lower part of the Gangetic Doab, including part of the Agra Division. The slightly distressed area comprises Rohilkhand, parts of the Agra Division, and Northern and Eastern Oudh. Up to April there was severe distress in the whole of the Agra Division and in East Oudh, but with the harvesting of the cold weather crops the circumstances of the people there greatly improved.

Central Provinces.

15. In the Central Provinces the area returned as severely distressed represents three-fifths of the whole area of the provinces. No district of the 18 into which they are divided is absent from the return. In four districts (Nagpur, Chanda, Wardha and Sambalpur) small areas only were affected; in four others (Raipur, Chhindwara, Bhandara, Balaghat) the affected area varied from one-third to a half of the district. In the remaining 10 districts the whole area was distressed. Taking the Provinces with reference to their geographical divisions, it will be seen that no part has altogether escaped the drought and its consequences. In the Vindhyan districts of Saugor and Damoh, and in the northern or Vindhyan half of the Jubbulpur district, distress was acute among the hill aborigines who had lost their crops of millet on which they chiefly depend for food-grain. There was also considerable distress among the agriculturists in the open country, as their resources had been exhausted by previous bad seasons. In the wheat-growing valley of the Nerbudda, comprising the southern half of Jubbulpur, Hoshangabad, Narsingpur and Nimar, the failure of the autumn crop and a very small spring crop combined with previous bad seasons to create widespread distress. In this fertile tract artificial irrigation is almost unknown. Where the monsoon rains, ordinarily here so certain, fail the cultivator, the loss of crop is necessarily great. The districts of the Satpura plateau—Chhindwara, Seoni, Betul, Mandla, and part of Balaghat—chiefly depend on the early rain crops. In 1896 these failed very generally throughout the plateau and little *rabi** was sown. In this tract, with the exception of the open part of the Chhindwara district where the crops were fairly good, distress was severe, and was heightened by exhaustion of local food stocks, inertness of trade and difficult communications with the lowlands, and consequent great rise in prices. South of the Satpuras the districts of Chanda, Wardha and Nagpur were more favoured with rainfall, the early autumn millets gave a moderate out-turn, and a fair area was sown with wild weather crops. In these districts there was comparatively little distress. There remain the three districts of Sambalpur, Raipur, and Bilaspur, in the Chhattisgarh division, and the Bhandara district in the Nagpur division, in all of which rice is the chief crop. The Sambalpur district and the southern half of the Raipur district had a fair rice harvest, and the cultivators also possessed large stocks from previous years which have been exported throughout the scarcity at great profit to the holders. The northern half of the Raipur district, the whole of the Bilaspur district, and three-fourths of the Bhandara district were severely distressed.

Among the circumstances which have made the famine in the Central Provinces exceptionally severe and widespread are the large aboriginal population, the exhausting effect of two previous bad years, the preponderance of rain crop cultivation, and the absence of large perennial irrigation systems like those which are so beneficial in Upper India. The very immunity from drought which this part of India has enjoyed in the past and the abundance of the average rainfall make drought here especially disastrous.

---

* *Rabi* is the vernacular term for the cold weather crops; *kharif* for the rain crops. In Bengal the early rain crops are known by the name *bhadoi*.

16. In the Punjab the distressed area is returned at 13,000 square miles, with a population of about 3½ millions, but relief on an extensive scale has been confined to the Hissar district. In this district very little of the rain crops or of the cold weather crop came to maturity, the cattle died in large numbers from want of grass and water, while the resources of the people had previously been exhausted by a very bad season in 1895–96. The other districts (Rohtak, Karnal, Umballa, Delhi and Ferozepur) in which relief was required lie in the south and south-east of the province. In all these the autumn and the cold weather crops yielded little, except on irrigated lands. In the Rohtak district the rain crop was half an average one, and the area under cold weather crops was less than one-third of the average acreage. There was no rain here from September to January, except a few showers in September. In the Ferozepur district the unirrigated area sown with cold weather crops was only 193,000 acres against an average of 701,000 acres. By utilising to the full every means of irrigation the cultivators secured 487,000 acres of wet crop against an average of 351,000 acres. But this extension of irrigation did not make up for the loss of crop on the dry lands, though it enabled the district to tide over a drought of exceptional severity. Between April and 31st October only 3 inches of rain fell in this district, the average being 14 inches. The November showers were slight and December was rainless.

The Punjab.

17. In Burma the area affected comprised the whole of one district (Meiktila) and parts of two others (Yamethin and Myingyan), which are situated in the "dry-zone" region of Upper Burma. The rainfall of this region is light and precarious, and droughts have frequently occurred in the past. The population is fortunately sparse, averaging about 100 to the square mile, and the male portion is accustomed to migrate to Lower Burma for some months of each year for harvest work. In 1896–97 there was an almost total failure of crops of all kinds. In 1897 also the rainfall up to the end of August was in great defect and the early crops failed extensively. Matters have since improved, owing to opportune and fairly heavy rain, but distress is expected to continue for some months longer. At no time, however, have the numbers on relief exceeded 35,000, and they have now fallen to 18,000. There has been no difficulty about food supplies, as rice has been freely imported from Lower Burma.

Burma.

18. The whole area of Berar is returned as affected, as relief operations were to some extent required in all the districts. But this somewhat overstates the extent or degree of distress. The autumn crops failed generally to the extent of a half, and the less important cold weather crops are estimated to have yielded only a quarter of the average. But the cultivating population of the Berars is exceptionally prosperous and well-to-do, and is able to tide over a single bad year without great distress. The labouring population has been affected by high prices and want of employment, and in the forest region of the Melghat there was severe distress. The numbers on relief have, however, never exceeded 34,000, and as an indication of the prosperity of the province it may be mentioned that the stocks of grain with the cultivating population at the beginning of the scarcity were believed to be fully a year's supply.

Berar.

19. The affected area in the territories of native states is returned at 82,000 square miles, with a population of 7,000,000. It comprised the Bikanir, Bhurtpur and Dholpur States in Rajputana, and in Central India the northern districts of the Gwalior State, and virtually all the States (of which Rewa is the largest) forming the Baghelkhand and Bundelkhand Agencies, and lying between British Bundelkhand on the north and the Central Provinces on the south. The southern States of Rajputana, the States of Indore and Bhopal, and the southern districts of Gwalior, in Central India, were not sufficiently affected to require relief operations, although they also experienced short harvests. In the Deccan the south-western districts of the Hyderabad State, which lie in the angle between the distressed districts of Kurnool and Bellary in the Madras Presidency and the distressed districts of Dharwar and Bijapur in the Bombay Presidency, were affected in much the same degree as the adjoining British districts.

Native States.

In Bundelkhand and Baghelkhand intense distress prevailed, as in the adjoining districts of British Bundelkhand in the North-Western Provinces and Oudh. There was widespread failure of the autumn crop, and the spring harvest in most parts was miserably poor. The cultivating and labouring classes were reduced to extreme destitution and underwent great privations. There was continued emigation into British territory, which was productive of much anxiety and inconvenience owing to the wanderers crowding on to the nearest relief works and peopling the poor-houses and relief camps on the main lines of communication. The measures of relief adopted by the rulers of the States concerned will be described later on. Here it is sufficient to say that they were not always sufficient to meet the emergency. In Gwalior and Bhurtpur and in the affected parts of Rajputana distress, though severe, was at no time nearly so acute as in Bundelkhand. In Hyderabad the affected districts, owing to preceding good seasons, entered upon the year of drought with large reserves of food-grain in the hands of the cultivators. The labouring classes, however, were thrown out of employment and have severely felt the pressure of high prices.

20. A comparison of the areas and populations affected by the late famine with corresponding figures for previous famines gives the following result. The drought of 1876–78 is considered by the Famine Commissioners to have been the most serious and widespread of any that have occurred in the century.* The area affected in Southern India in those two years was about 200,000 square miles, with a population of 36,000,000. In this area famine was intense in an area of 105,000 square miles, with a population of 19,000,000; severe in an area of 66,000 square miles, with a population of 11,000,000, and slight in an area of 34,000 square miles, with a population of 6,000,000. In 1877–78 a further area of 52,000 square miles in the North-Western Provinces and the Punjab, with a population of 22,000,000, was afflicted by a failure of the rains, though it suffered to a far less degree. In August, 1877, just before the drought broke up, the total area affected in India was about 250,000 square miles, with a population of 58,000.000. In the late famine severe or intense distress extended over an area of about 270,000 square miles, with a population of over 50,000,000, and a further area of 33,000 square miles, with a population of 13,000,000 was so far distressed as to make relief operations necessary. Thus in point of actual extent the late famine affected a wider area than the famine of 1876–77. As regards the area of intense distress it is safe to place in this category about 40,000 square miles in the Central Provinces, with a population of 5,000,000; 3,000 square miles in Oudh, with a population of 2,000,000; 12,000 square miles in British Bundelkhand, with a population of 3,000,000, and 25,000 square miles in Central India, with a population of 3,000,000. This gives a total area of 80,000 square miles in which distress was intense, with a total population of 14,000,000, without including any portion of North Behar or the Deccan or the Hissar district, in the Punjab, in parts of which the Famine Commission's criterion of intense distress—the loss of 75 per cent. of the average harvest of the year—was fully satisfied. As regards therefore the extent of intense famine there is little to choose between the drought of 1876–78 and that of 1896–97. The numbers on relief, if this be any test, have been very much greater on this occasion than in 1876–78, and a very high level of prices has continuously prevailed over a larger area than in that year. Where this year's famine has fortunately differed from the famine of 1876–78 is that the drought has completely broken up, save in the Deccan and Upper Burma, at the end of the first year. Even in the Deccan and Upper Burma the rainfall of September should secure a cold weather crop and place the termination of distress within measurable distance. At no point of time has the crisis been so acute as in August 1877, when Southern India had entered upon its second year of famine and the rains to all appearance had failed in Upper India.

* Famine Commission's Report. Part I, paragraph 75.

III.—The course of prices.

21. Prices are the barometer of scarcity in India. Even when high prices in a locality are occasioned not by local failure of crops, but by failure elsewhere, they mark the beginning of pressure on the landless classes,—the day labourer in the villages and the poorer inhabitants of the towns. From the rainfall of the year 1896–97 to the course of prices in that year is therefore a natural transition. The following return gives the average prices in each month in certain markets of the food-grains most in use in each tract :—

(1) This table, which has been compiled from the *Gazette of India* returns, gives the number of seers, and decimals of seer, purchaseable for Re. 1. 1 seer = 2·057 lbs.
(2) Jowar or Cholum is a large millet, the *Sorghum vulgare*.
(3) Marua or Ragi is a small millet, the *Eleusine corocana*.

22. From this table it will be observed that, compared with the prices prevailing in the three previous years, prices ruled high in the North-Western Provinces in the early part of 1896 before there was any apprehension of the failure of the monsoon rains. The harvests of 1895-96 had been poor in the provinces generally, and in the Bundelkhand districts very bad. The Punjab in 1895-96 also had poor harvests, and prices there in June 1896 were relatively high. In Madras and Bombay harvests had been good, and food-grains in June 1896 were cheap. It will also be observed that the great difference existing in ordinary years between the price of wheat and the commoner grains vanishes in a year of scarcity, and that then all food-grains draw together at the same high level of price.

23. According to the Famine Commission, "in time of very great scarcity "prices of food-grain rise to three times their ordinary amount, so that whereas in "ordinary years the price of the food-grain of the mass of the people may be from "20 to 30 sers the rupee, in time of great scarcity it will rise to 8 or 10 sers "(16 to 20 lbs.) the rupee and even higher." The course of prices during the late famine has been in general conformity with this rule. The cheapest grain purchaseable has for months ruled throughout vast areas at 8 or 10 sers the rupee and even higher. But since the Famine Commission wrote, the price of food grains in ordinary years has risen in India, and only in exceptionally good seasons does the rate of 30 sers to the rupee maintain. In the Punjab 1894 was such a year, and very low prices for the commoner grains prevailed. In Eastern Bengal, one of the most prosperous parts of India, the price of common rice for years past has not exceeded Re. 1 for 15 sers. In 1880-85 from 20 to 30 sers was there the ordinary rate. In the Bombay Deccan the price of the great millet (jowari), which is the staple food of the people, is now more often above than below Re. 1 for 20 sers. The rise in food-grain prices since 1881 is still more remarkable in tracts to which the railway has penetrated. In 1880-84 rice sold at from 30 to 50 sers the rupee in the Chhattisgarh Division of the Central Provinces. The normal price of recent years has been below 20 sers. These facts have to be borne in mind in applying the formula of the Famine Commission to the present circumstances of India. A rate of 8 or 10 sers the rupee, though it still presses heavily on the great mass of the population, can no longer be regarded as a rise of 300 per cent. on the normal price of food-grains. Another peculiarity of the late scarcity is that though prices rose at once in the first days of the drought to famine level, as determined by the Famine Commission, it was only in the worst tracts and in the time of greatest apprehension that they reached the extreme height of former famines. In June and July of 1877 *jowari* rose in the Bijapur District in the Bombay Deccan to 4½ sers the rupee. This year, although the crop failure in Bijapur was as widespread and complete as in 1877, prices have remained steady at between 7 and 9 sers the rupee. In the Central Provinces food grains rose for a fortnight to 5½ sers the rupee in the Mandla District in July last owing to exhaustion of local stocks; but on import being resumed, prices at once fell back to a lower level. High rates were also reached in parts of the Chota Nagpur Division, where local supplies gave out early in the year, and the distances from the railway and large markets are considerable. Here rice, the stape food-grain of the country, has at times touched 4½ and 5 sers for the rupee, and might have risen higher had not the Government by a system of bounties stimulated importation. If such exceptional cases be left out of account, it may be said that a rate of from 7 to 10 sers the rupee has been maintained throughout the greater part of India with singular persistency from the failure of the monsoon in October 1896. The great equality of prices throughout the country was also remarkable. The Meerut Division of the North-Western Provinces had good autumn crops and a good cold weather harvest. But prices have ruled practically as high there as in famine-stricken Bundelkhand. In the Punjab there was only the difference of the railway freight between prices in the most fortunate of the canal districts, where the cold weather crops were nearly up to the average, and in Hissar, where not one acre in five yielded a crop. This universal prevalence of high prices was the cause of much privation amongst the poorer classes, especially the poor classes of towns, outside the areas of local failure of crops. On the other hand, tenants and owners of land in the non-distressed districts have made large profits, and in such

exceptional tracts the poor seem to have been sufficiently provided for by private liberality. In the Madras Districts lower prices have prevailed than elsewhere, as the crops in the south of the Presidency were good. But the tendency has been for the Madras prices to level up to those of the Bombay Deccan, more especially in the later period of the famine.

IV.—Food Stocks.

24. The rapid and extraordinary rise in prices described in the preceding section raises the question whether there was any serious deficiency of food supply in the country. The materials are not sufficient for a full discussion of this most important question, but it cannot be entirely excluded from consideration.

The position of India in ordinary years is that it produces sufficient food for its own requirements, with something to spare for export or for storage. The Famine Commission after a prolonged enquiry came to the conclusion that the annual food grain production of British India (excluding Burma but including Mysore which was then under British rule) was 51,530,000 tons, that its requirements were satisfied by 47,165,000 tons, and that a surplus of 5,165,000 tons was available for export or for storage. Since the Famine Commission wrote the population of the same area has risen from 181 millions to 212 millions, an increase of 17 per cent. The food requirements of this increased population would, on the data employed by the Famine Commission, be 54,308,000 tons. During the same period the area under food grains has risen from 166½ millions of acres to 185 millons, an increase of only 8 per cent. The production of the present food crop area, according to the standard of yield adopted for each province by the Famine Commission, is 56,000,000 tons. On these figures a surplus of only 1,700,000 tons results, in place of the surplus of 5,160,000 tons estimated by the Famine Commission in 1881 as existing in ordinary years. If the Famine Commission's estimate was at all correct, it is difficult to avoid the conclusion that a deficiency in the yield in any year is now more serious than in 1881, since the margin in ordinary years is smaller. Allowance must be made for the greater extension of irrigation during the last decade and for the larger average yield of the areas thus benefited. But the most liberal allowance on this account will not bring the annual surplus above 2,500,000 tons. This estimate receives some confirmation from the statistics of sea exports. The exports of food grains from British India (excluding Burma) to foreign countries have averaged 1¼ millions of tons in the last 10 years and little over 1 million of tons in the last five. If the food production of the country resulted in ordinary years in a surplus much in excess of these figures, the consequent accumulation of stocks would be indicated by a fall in prices. But prices on the whole have tended to rise. In particular years particular provinces no doubt produce food in large excess of their requirements and in excess of the estimated surpluses shown by the Famine Commission. This was the case in the Punjab in 1894-95 and in the Bombay Deccan and Madras in 1895-96, and it was marked by a very low range of prices in those tracts, by exportation from them to other parts of India where harvests had been less bountiful, and by large surplus stocks which have proved very useful in the present famine. But this is not incompatible with the theory that taking the country as a whole its surplus production of food grains in ordinary years is small, and that if the crops in any year are below the average over considerable areas, the year's outturn will fall very seriously below the requirements of the population. In the above survey the food production of Burma and of the Native States of India has been left out of account. As regards the Native States it seems probable that their exportable surplus ordinarily is small. Burma has usually an exportable surplus of from ¾ths of a million to 1½ million tons of rice, most of which finds a market in Europe and the Straits. This year however, a large portion of the Burma surplus was diverted to India and had a very salutory effect in steadying the Indian markets.

Famine Commission's Report, Part I, paragraph 156.

25. To return to the outturn of 1896-97. The crops are known to have failed very seriously over large areas, and elsewhere were below the average. There is thus a strong probability that the production of the year was much below the

requirements of the population. Yet with the exception of 600,000 tons of Burma rice there was no import of food grains from abroad, and there has been no absolute dearth of food. It has always been purchaseable though dear. Accumulated stocks must therefore have been in existence and have made good the deficiency in the year's output. The amount of the deficiency cannot be quantitatively stated. All that can here be done is to indicate approximately, by examination of the effect of the drought on the harvests of each province, the extent to which the year's outturn appears to have been below that of ordinary years.

26. In the *Punjab* the aggregate yield of the autumn and the spring harvests of 1896-97 seems to have been about 25 per cent. or 30 per cent. short of an average crop. In some districts the deficiency was very much greater and in others less than this. Considering the scanty rainfall of the year the result was highly satisfactory, and it could not have been attained were it not that the province is exceptionally well equipped with canals and wells and its agriculturists willing and able to make the fullest use of them. No less than 40 per cent. of the rain crop area and 50 per cent. of the spring crop of 1896-97 was irrigated—percentages higher than have ever been known before. The food grain production of the Punjab is in normal seasons considerably in excess of its requirements. Taking into account the economy in consumption enforced by high prices, the yield of 1896-97, though below the average, probably represented one year's food supply for the province. The food stocks in existence in the province at the beginning of the drought have been estimated to represent 7 months' further supply. Thus the Punjab as a whole has been very fortunately situated. Local deficiencies of food stocks, as in the district of Hissar, have been easily made good by importations from the less affected districts, and grain has been steadily going out of the province to the North-Western Provinces and the Central Provinces.

The *North-Western Provinces and Oudh* were less fortunately situated. These provinces owing to their dense population are not credited with producing a large surplus of food even in ordinarily good years. In 1896–97 the autumn crop as a whole was fully 50 per cent. and the spring crop 33 per cent. below the average. Taking the two crops together the province may be considered to have lost two-fifths of its ordinary harvest outturn. The loss would have been very much greater but for the splendid canal systems which traverse the western and central portions of the North-Western Provinces, under the names of the eastern Jumna Canal, the Agra Canal, and the Ganges Canal, and for the innumerable wells and ponds which stud the face of the country, especially in Eastern and Southern Oudh, and in the eastern districts of the North-Western Provinces. The canals irrigated 3,000,000 acres in the two harvests of 1896–97. The area irrigated by wells and tanks has not yet been returned, but it may be safely said that in very few districts did the spring crops yield much, except on irrigated lands. To irrigation therefore the very fair results of the spring harvest of 1897 must be ascribed. The efforts made by the cultivators to utilise to the fullest possible extent every drop of water and to raise a crop were described by observers as heroic. Still the deficiency in the food production of the year was large. Stocks seem to have been low owing to preceding bad seasons. The statistics of railway traffic show a large continuous import of food grains into the province from the Punjab and Bengal from the first days of the scarcity. Much of the Burma rice found its way to Bundelkhand and Oudh. With the completion of the cold weather harvest the pressure perceptibly eased off in the less distressed parts of the province, and grain moved in large quantities from them to the more distressed tracts.

In *Bengal* the great crop of the year is the winter rice which occupies 31 million acres in a total food crop area of 53 million acres. The food crops harvested in the spring occupy 9½ million acres, and the early rain crops of rice and millets 12¾ million acres. The yield of the late rice crop in 1896-97 is returned at under half an average crop, a deficiency of about 8 or 9 million tons. of food. The early rain crops of 1896 were 40 per cent. below the average yield. The spring harvest of 1897 was an average one. The agricultural returns of Bengal are less exact than in other parts of India, and it is possible that the crop failure was not quite as great as reported. But even in that case, the production

of the year cannot well be placed above two-thirds of the average outturn. This would be much below the requirements of the population for the twelve months. In the distressed districts of North Behar local stocks were soon exhausted and imports have been on a large scale. Large quantities of Burma rice went there. Elsewhere there must evidently have been considerable reserves of food. Not a few districts have continuously exported and have shown no signs of exhaustion.

In the *Central Provinces* the outturn in 1896–97 seems to have been fully 55 per cent. below the ordinary yield. With average harvests the province is estimated to produce about 3¼ million tons of food-grains, of which from 300,000 to 400,000 tons are in excess of its requirements. This year the outturn fell below its actual requirements by about 1,000,000 tons. The deficiency must have been chiefly met from food stocks existing in the province, as the imports from outside have not been large. Within the province grain has moved freely from the less distressed districts to the more distressed ones. Great economy of consumption has also been practised under the stress of acute distress.

In *Bombay* the Deccan districts enjoyed two good years immediately preceding 1896, and on the estimates of the local Agricultural Department had in that period accumulated reserves of food equivalent to a 9 months' supply. It was fortunate that this was so, for the food-grain outturn of the year in the affected districts was little, if anything, over one-fourth of the ordinary yield. Outside the affected area Sind had average harvests, while Guzerat was somewhat in defect. The total outturn of the Bombay Presidency in 1896–97 may be put at five-eights of the production of an ordinary year, and consequently was less than 12 months' requirements of the population.

In *Madras* the outturn of the distressed area in the Deccan may perhaps be put at one-quarter of the average ; and in Ganjam and Vizagapatam the outturn was short by probably 50 per cent. Elsewhere the deficiency was not great, and as the distressed areas were relatively small, the year's outturn of the Presidency was probably within 20 per cent. of the normal. Stocks also were large. Prices have been lower than elsewhere, and the grain exports to other Provinces have exceeded the imports. Madras therefore has not been in serious difficulty about its food-supplies.

In the *Berars* the autumn crop which there occupies a much larger area than the spring crop was said to be short by 50 per cent. ; and the spring crop by 75 per cent. This is probably an over estimate of loss. The cultivators were said to have had a year's supply of food-grains in hand, and though prices have been high, there seems at all times to have been sufficient food in the province.

Regarding the *Native States* in which distress has prevailed, it is only possible to speak in general terms about their food production and requirements. In the Nizam's Dominions the distressed districts had, like the Bombay and Madras Deccan country, enjoyed good seasons up to 1896, and entered on the scarcity with large stocks of grain. Much of this was drawn away to British districts in the first months of the drought, and then holders of grain took alarm and refused to sell. Prices reached a very high level in parts of the State, but there is evidence that considerable reserves still exist. In Bundelkhand and Baghelkhand the year's production of food must have been much below the requirements of the population, as the harvests were as bad as in British Bundelkhand. On the relief works in Rewah considerable quantities of Burma rice were sold, and despite of the prejudices which as a novelty it excited it found its way into remote village marts. The Gwalior and Dholpur States must also have been short of supplies, as they imported grain largely from the Meerut Division of the North-Western Provinces and Oudh, and from Rajputana. The Rajputana States on the other hand had for the most part fair harvests and considerable stocks, and were able to export.

27. Summarising the results of this investigation as regards British India, the table below indicates that the food-outturn of British India (excluding Burma) in 1896–97 was about one-third below that of ordinary years. This represents a deficiency of about 18 or 19 million tons. The consumption of the people under the stress of high prices has unquestionably been reduced, and a portion of the

deficiency has in this way been covered. The rest has been made good by reserve stocks, and by the import of about 600,000 tons of rice from Burma.

V.—The first period of the Famine—Alarm and Preparations.

28. The first premonitory report of the impending trouble came from the North-Western Provinces and Oudh. On the 30th September 1896 the Lieutenant-Governor informed the Government of India that since the beginning of the month increasingly unsatisfactory reports of the condition of the people and the prospects of the crops had been received from his officers. The rains, it was said, had practically ceased just when they were most wanted. Very serious damage had already been done to the autumn or *kharif* crops. If sufficient rain should fall before the middle of October, it was anticipated that the *kharif* still standing might be saved, and that the usual *rabi* area would be sown. If no rain were to fall the outlook would be very serious. The provinces had already suffered from two successive years of bad harvests. The people were crippled in resources and their stocks of grain exhausted. Prices were very high, and were still rising. Wheat was selling at 9 to 10 seers the rupee, and barley at 12 sirs, prices which represented a rise of 50 per cent. on those ruling in the early part of the year. In anticipation of relief measure on an extensive scale being necessary, the programmes of relief works were being carefully revised. A list of railway projects was given, the earthwork of which would afford useful and beneficial employment for famine labour. To this report was added a copy of the instructions which the local Government had addressed to district officers, directing them to institute special inquiries in each subdivision as to the actual condition of the *kharif* crops and the prospects of sowings for the *rabi* crops, and to report the result, together with estimates of the maximum number of persons for whose relief provision would be required, by the end of October. Authority at the same time had been given to them, in case distress appeared, to open public works under ordinary labour conditions to test the pressure on the people. They were also enjoined to complete in advance all the preparations prescribed by the Famine Code for the methodical and effective administration of relief.

North-Western Provinces and Oudh.

29. This preliminary report was followed on the 23rd November by a letter setting out very fully the situation as then developed and describing the measures which the local Government had adopted for dealing with it. This letter is remarkable for the accuracy with which it anticipated the extent and nature of the distress which would occur, and for the forethought with which the detailed plan of operations that has been followed with complete success and very little variation had been prepared. It began by reporting that no improvement in the outlook had occurred. October like September had been practically rainless. The only portion of the province which had escaped injury was the Meerut Division, where heavy rainfall in July and August had successfully carried the crops

through the subsequent dry months; and the parts of the Agra Division which are protected by canals. In the rest of the provinces the failure of the *kharif* crop varied from a loss of one-fourth in certain localities to a loss of three-fourths and over in others, the failure being greatest in those districts in which rice was most largely grown. The tract most affected lay between the Ganges and the Gogra, and included the greater part of Oudh and the district of Azamgarh. With this area Bundelkhand was also classed as, although its *kharif* in four districts out of five was returned as one-third of an average harvest, it had already suffered from famine. The worst area thus arrived at comprised 35,000 square miles, with a population of 15¾ millions. With regard to the prospects of the *rabi* crop the sowings were estimated at 58 per cent. of the normal area cropped, ranging from over 70 per cent. in the Meerut and Rohilkhand Divisions to 42 per cent. in the Allahabad Division. Much, it was said, depended on rain falling in December and January. In the worst area famine was anticipated whether there were winter rains or not. In the area of less serious crop failure, comprising about 20,000 square miles with a population of 11¼ millions, there would be much distress deepening in particular localities into famine. In the remaining area no general relief would be required. As to food supplies, confidence was expressed that there were considerable stocks of grain in the country and that food would not fail as long as there was money to buy it. Prices were, it was true, phenomenally high, and presented "many of the features, notably that of approaching equality between "the prices of the coarsest and the best food grains, which characterise famine "times." But trade was active, and the Lieutenant-Governor strongly expressed his opinion that it would be equal to any probable emergency, and that nothing should be done to interfere with its free play.

30. The relief measures which had already been started were then described. Advances had been liberally made to cultivators for the construction of wells and the purchase of seed, and over 200,000 temporary wells had been thus constructed for irrigating the winter crop. Land revenue to the extent of 80 lacs of rupees (£*x*. 800,000) had been suspended. Programmes of large public works, chiefly the construction and repair of roads, calculated to employ 3,000,000 labourers for three months, were ready, and nearly 100,000 relief labourers were already employed. These works were to be managed by the Department of Public Works. Certain railway projects were also proposed with the same object to the Government of India for early sanction. In addition to these works, lists of small village works were being drawn up, which it was proposed to utilise for the purpose of drawing the people from large works back to their homes at the approach of the hot weather and employing them in their own villages. Poor-houses had been opened for the reception of waifs and strays, and relief circles formed and circle officers appointed in each distressed district for the purpose of administering relief in their homes to women debarred by custom from appearing in public, and to men of respectable classes unaccustomed to manual labour, to whom such relief is admissible. It has been already said of this programme that in few respects only were departures from it necessary. These departures may here be conveniently noticed. For various reasons few of the railway projects recommended by the local Government could be utilised as relief works, and relief labour has been practically confined to road-making and road repairs. Small village works have proved less useful than was anticipated, and large works have been found necesssary throughout the famine. Gratuitous relief, as time went on, was largely expanded, and embraced not only the classes unaccustomed to work or to appear in public, but the aged, the young and the feeble of the labouring classes.

Bengal.

31. The Government of Bengal in October 1896 submitted to the Government of India two preliminary reports from the Commissioner of the Patna Division on the condition and prospects of the crops of his division. The Commissioner reported that the winter rice crop was withering daily from want of rain, and that prices were rising fast. These reports were followed in November by a more complete account of the situation both in Behar and in the rest of Bengal. It was remarked that "all known famines in Bengal and Orissa have been rice "famines. In Behar and Northern Bengal the *bhadoi* and *rabi* crops may be the "turning point between famine and no famine, but even there the immediate cause

"of scarcities and famines has always been the failure of the winter rice crop." For this crop rain is required in September and October. In September 1896 the only considerable fall occurred about the middle of the month, which saved, though it failed to fully restore, the crop in most districts except in east Behar. In parts of six districts in Central Bengal and Orissa, a deficiency of 50 per cent. of an average crop was anticipated. These tracts, however, were not considered to give cause for anxiety, except that prices were everywhere extraordinarily high. In Behar the Commissioner put the probable yield of the rice crop for the whole Patna Division at not more than a quarter of the average yield. An area of 4,300 square miles with a population of 3½ millions was estimated by him to be likely to require relief, and relief would be necessary for about 5 per cent. of this population, or 170,000 persons. The Government of Bengal thought this estimate of relief too low, as no doubt it was. The crop-failure in Behar was, in its opinion, as great as in 1873–74, while the circumstances of the people were little improved. "The "population is extremely dense, and the great majority of the people are much "poorer than in most other parts of these provinces. The ordinary wages of "agricultural labour are extremely low, being for able-bodied and agricultural "labourers only from 1½ to 2½ annas the day, and they have, owing partly to the "growth of population, and partly to the influence of custom, remained practically "unaltered for the past 20 years or more, while the prices of food grains have "increased largely during the same period." But what caused the Bengal Government most anxiety was the possibility of a serious deficiency in the food supply of Behar. According to its calculations, the outturn of the three harvests of the year in the Patna Division, together with stocks in hand (assumed to be equal to three months' supply), would be below the year's requirements of the division by 550,000 tons. Where the difference was to come from and whether private trade would be equal to supplying the deficit were questions which the Government of Bengal was very doubtful about, though it inclined to the opinion that by importations of rice from Burma or of wheat from America private trade would meet the food wants of the Province.

32. It may be noticed that the Commissioner, though he furnished the estimates of crop-yield on which the local Government based its calculations, took a hopeful view of the situation. Comparing it with the situation in 1873–74 he thought that the material prosperity of the division had increased, that owing to good years the people were in better condition than in 1873, and that the two crops (*bhadoi* and *kharif*) of which there was fairly certain knowledge were better than in 1873, except in Muzaffarpur and Saran. He saw no reason to fear that the third crop (*rabi*) would not be as good as in 1873–74, when it varied from a half to a three-quarters crop. In that case the Patna, Shahabad and Gya districts would have a total outturn from the three harvests approaching or exceeding half the normal yield. In Champaran, Darbhanga and Muzaffarpur the *rabi* was comparatively unimportant, and owing to the serious deficiency in the *bhadoi* and *kharif* crops he considered the outlook there to be serious. He remarked, however, that since 1873–74 an entire revolution had been wrought in all the conditions of famine relief in Behar by the immense development of communications. In 1873–74 there was only one railway in Behar, and that ran through the two southern districts of Patna and Shahabad. In 1896 there was at least one line of rail in each district, and in the division 589 miles were open. In 1873-74 the Sone canals had

Comparative outturn in annas furnished by the Commissioner.*

* A 16 annas (= Re. 1) yield is taken in Indian agricultural estimates to represent an average crop: and 8 anna crop is thus half an average crop. A 20 annas crop is a full or bumper crop.

not been opened. In 1896 they supplied water communication for many miles. In 1873–74 there were no steam ferries in the division. Now they were frequent. Lastly in 1873–74 the number of roads open were a mere fraction of what they were in 1896. In the whole division 12,500 miles of road were now open. He rightly concluded that all these charges would immensely facilitate, and render vastly less expensive, the supply of grain and the execution of all operations connected with the relief of distress.

33. In December, on the Lieutenant-Governor visiting Behar, the details of the scheme of relief were settled. The distressed tracts were blocked out into relief charges and relief circles. A charge contained an area of about 200 to 300 square miles with a population of about 250,000 persons: and a circle an area of about 30 to 40 square miles with a population of about 25,000 to 30,000 persons. To such of the charges as could not be officered by Assistant Magistrates, Police Officers and Deputy Collectors, young indigo planters specially employed for the occasion were appointed. In the three districts of Champaran, Darbhanga and Muzaffarpur, where the failure of the rice crop was greatest, 15 charges and 66 circles (to be increased eventually to 31 charges and 197 circles) were immediately formed. With regard to relief works, all large works were to be placed directly under the Department of Public Works, and all others managed by the Civil authorities. A list of large works, including several canal and drainage schemes and two railways, was drawn up, but as the event proved, it was not till a late stage of the scarcity that work could be commenced on them, and in the earlier months the relief workers were mainly employed on small scattered works, mostly village tanks, managed by the charge Superintendents and their subordinates. The Superintendents were also the officers responsible for seeking out the destitute poor in the villages within their charges, and placing respectable women and others, who were unable to labour and ashamed to beg and had no relatives to maintain them, on gratuitous relief in their homes.

To stimulate sowings for the cold weather crop a bonus of one rupee was granted to cultivators for each earthen well sunk by them for irrigation purposes. Money advances free of interest were also offered to landowners and others for undertaking in their own villages the excavation of tanks and the execution of other petty improvements, and thereby providing employment to the people. As Behar enjoys a permanent settlement, no suspension of the land revenue demand was proposed.

34. In these preliminary arrangements for relief in Bengal one or two special features may be noticed. The charge and circle organization was on a much larger and more expensive scale than in any other province and had a much larger European element. This is probably inevitable in Bengal in the absence of the subdivisional and village revenue establishments entertained in temporarily settled Provinces. The prominence given to gratuitous village relief in the duties assigned to this special staff, and the reliance placed on numerous small relief works close to the homes of the people, are also noteworthy. All these feature are found in the administration of the Behar famine of 1873–74. The anxiety felt lest the food-supply should run short and the discussion which afterwards ensued between the local and the supreme Governments as to assisting the trade to import also recall the Behar famine. It is interesting to observe this general tendency in each province to work on the administrative lines of its last great famine. Notwithstanding the levelling influences of the Famine Commission and the Famine Codes the respective relief systems of Madras and Bombay in the late famine presented distinctive features, and these can readily be traced back to the relief methods respectively adopted in each Presidency in the great famine of 1876–78.

The Punjab.

35. The first report from the local Government of the Punjab, written in the third week in November, described the situation in very sombre colours. The rain crops in the south and south-east of the Provinces had extensively failed, and unless rain fell before the end of the year the cold weather crop would also fail. The rise in prices was everywhere causing uneasiness. Actual distress so far was confined to Hissar and adjoining districts, but active preparations throughout

the province to encounter famine were necessary and were being made. As events turned out, these apprehensions proved to be exaggerated. Rain fell in good quantities in December and January, the *rabi* crops in the canal tracts were extremely good, and the *rabi* as a whole was probably within 25 per cent. of the normal outturn. In Hissar and in parts of Rohtak there was severe distress and relief works on an extensive scale were here required. Elsewhere the people maintained themselves without resort to State aid to an unexpected degree, and in the canal tracts the landowning and cultivating classes made large profits through the high prices of grain.

The Punjab Government in its relief measures was fortunate to have ready several large works of permanent utility on which it could employ relief labour. In the Hissar district the Gaggar canal and in the Gujrat district the Jhelum canal were thus utilised. Employment was also found on the earthwork of several projected railway lines. The labourers were generally of a robust type, capable of doing a full day's work, and it is believed that the greater part of the expenditure on relief works in this province during the late famine has returned good value in the form of public works of permanent utility.

The Central Provinces.

36. A premonitory report from the Chief Commissioner of the Central Provinces reached the Government of India in the last week of October. The Chief Commissioner in reporting that the rains had failed since the beginning of September in almost every district of the province was unable as yet to state definitely the extent of damage sustained by the rain-crops or the probabilities of successful cold weather sowings. The emergency however appeared to him to be one "much in excess of any which have previously been experienced in the provinces." What made the situation more serious was that "the three previous years had "been in a great part of the province not years of full crops, and in the three "districts of Saugor, Damoh, and Jubbulpur they had been years of widespread "failure of the important *rabi* harvest." Up to August the rains had been favourable, and the cultivators in the expectation of a good harvest had parted with much of their surplus produce, which had been exported to other provinces where prices were higher. Prices in the provinces had now gone up with a bound : and "after "four years of hardship and short harvests, the agriculturists find themselves in "face of a prospect of some pressure which cannot be expected to slacken until "the next monsoon, it may be hoped, brings back normal weather conditions. "The cumulative force of these adverse circumstances makes the position one "of great gravity." A provisional grant of five lacs for starting relief works was asked for and was given. In November a further grant of 10 lacs was asked for with the object of giving advances to agriculturists for irrigation tanks and other similar works of improvement in certain districts, especially in the rice country of Chhattisgarh, which would furnish employment to the people in the neighbourhood of their homes. "The money spent will be recovered with "interest, the people will be kept from wandering and starvation, villages will "be held together, and cultivation will be rendered secure instead of precarious." Before this application was acceded to some discussion took place as to the restrictions which should surround such expenditure. It was explained to the Chief Commissioner that in a time of financial pressure the Government of India could not find funds for advances for land improvements except under conditions that would ensure that the expenditure actually operated to give relief to persons in distressed tracts who required relief. Similar instructions were given to other local Governments, and throughout the famine have been strictly adhered to by the Government of India in making or refusing allotments for advances for land improvements.

37. In the middle of December the Chief Commissioner reported fully on the situation. The *kharif* was in no district better than half an average crop. The *rabi* crops had germinated better than had been expected, but the area sown was less than usual and some sowings had failed. As the position of each district greatly depended on the character of the harvests of the three preceding years they fell conveniently into the groups given in the table below :—

	A.			B.			C.				D.							
											Poor.					Bad.		
	Sambalpur.	Nimar.	Chhindwara.	Warda.	Nagpur.	Chanda.	Raipur.	Bilaspur.	Betul.	Mandla.	Seoni.	Narsingpur.	Hoshangabad.	Bhandara.	Balaghat.	Jubbulpur.	Damoh.	Saugor.
Estimated anna outturn of current *kharif.* ...	10	8	5	8	8	8	4	5	4	3	4	6	5	6	3	5	6	5
Proportion of *kharif* to *rabi* area. *Kharif*	98	87	58	60	50	66	69	61	61	67	48	37	27	63	75	48	46	38
Rabi	2	13	42	40	50	34	31	36	39	33	52	63	73	37	25	52	54	62
Present prospect of spring crop. ...		Poor.	Good.	Good.	Good.	Good.	Good.	Good.	Poor.	Good.	Good.	Fair.	Fair.	Good.	Good.	Good.	Fair.	Bad.

Groups A and B gave little cause for immediate anxiety, as past harvests had been good or fair and the present harvest was less deficient than elsewhere. In group C the crops of 1895–96 had been good, but the poor yield of the standing *kharif* made some distress certain, especially in Mandla. In group D the situation owing to three bad years, the badness of the *kharif* crop, and the prospect of a poor spring harvest in the Nerbadda districts, where *rabi* is the principal crop, was very serious. "The great majority of the classes in the provinces who will suffer most "are almost entirely dependent on the autumn crops—rice, *juar*, and the smaller "millets. Nearly all their land is cropped with these grains, and when these fail, "as they have this year almost everywhere failed, the most plentiful outturn of "wheat and grain is, apart from its effect in lowering the general price of food "stuffs, of little or no benefit to the people." "We must," the Chief Commissioner continued, "be prepared to face continued and general distress till well on in July "or August. In some parts, notably Saugor, Jubbulpur, Balaghat and parts of "Damoh, past years have been so bad, and the people are so depressed and "impoverished by the calamities of successive seasons, that it will take at least a "year of renewed agricultural prosperity to make the poorest classes independent "of Government relief."

38. The scheme of relief contemplated the opening of village works by the civil authorities in all localities where scope for such works existed, as the first stage in the organization of famine relief. The main thing to be done, it was thought, was to keep the people on their land and to provide sufficient work and food for them near their homes to prevent their throwing up their holdings before better times came round. As distress deepened and the number of persons to be relieved grew, large road works were to be opened under the management of the Public Works Department. For the provision of gratuitous relief, poor-houses had been established at centres. These were to be supplemented by more numerous relief centres brought nearer the homes of the people, with small works attached to them for enforcing a task on applicants for relief capable of doing light work. Gratuitous relief in the homes of the people might eventually have to be organized, but this was thought not to be an urgent matter.

39. This scheme is open to criticism as being adapted to a much lighter calamity than that which actually had befallen the provinces. Distress speedily outran the village works and the poor-houses on which reliance was placed. The relief centres and the poor-house population grew to unmanageable dimensions. As events showed, it would have been better had large relief works under the Department of Public Works been started, and village relief organized, at an earlier date. Unforseen delays occurred in the publication of the departmental programme and the organization of the work-establishments. Village relief could not be effectively administered by the district staffs until they were reinforced by British military officers lent for the purpose by the Military Department, and this took time. The order in which the districts were placed with reference to the degree of distress anticipated in each has proved generally correct, except that as time went on the centre of distress shifted from the Nerbadda Valley to the rice districts of Bilaspur and Raipur, and the plateau districts of Betul, Mandla and Seoni in the Satpura range.

Bombay.

40. A brief intimation of extensive crop failure in the Deccan and Southern Mahratta country was made by the Bombay Government in November. The full report was delayed till January, as a good fall of rain towards the end of November was thought to have materially altered the outlook and rendered comparatively useless the calculations previously made. The area reported to be affected was about 42,000 square miles and comprised the whole or portions of eight districts, with a population of 6¾ millions. It was stated that the *kharif* crops, where they had not absolutely failed (as in Bijapur and Sholapur), had yielded but one-quarter of an average crop; that large areas had been sown with *rabi* chiefly after the November rain: and that the intensity of the distress in each district depended entirely on the outturn of these crops. It was feared that owing to subsequent dry weather the crop sown after the November rain would, except in favoured localities, come to nothing. Prices were extraordinarily high and the pressure on the poorer classes was already severe. There were 167,000 persons already on relief works, and the numbers were rapidly increasing. It was proposed to concentrate labour as much as possible on a few large works and to restrict village works to persons who for various reasons could not leave their homes. There was a keen demand for advances for wells among the agricultural classes, and it was considered that much employment could thus be economically provided. Steps were being taken to open poor-houses, and gratuitous relief was already being given on a small scale in villages to persons unable to labour. The condition of the cattle, owing to the scarcity of fodder, was very serious. Numbers had already died or had been sold for slaughter in Bijapur and Sholapur. The people were being urged to take their cattle to the forests where there was grazing to be had. And to provide for cattle which could not thus be moved the Forest Department had arranged to cut and press grass and place it in depôts at the railway stations. A prominent feature of the distress in the Presidency was the large number of weavers in need of relief. In some towns there were thousands reported to be in search of employment. The great majority of these the local Government considered would require no special provision and could find employment on the ordinary relief works. Only to such as were deemed incapable of thus gaining a livelihood was semi-gratuitous employment in their own craft to be given.

Bijapur.	Nasik.
Sholapur.	Satara.
Belgaum.	Ahmednagar.
Poona.	Khandesh.

41. The decision in this scheme of relief to depend on large works professionally managed has been consistently adhered to with excellent results. The unnecessary expansion of relief which follows the opening of numerous small works was avoided and a very useful distance test was thereby indirectly applied. On the works hutting accommodation was provided for the workers, and as a further test residence upon the work has in some cases been made compulsory. The special fodder arrangements appear to have proved useful. A very large quantity of pressed grass was placed in the districts by the Forest Department, and was disposed of at prices which covered all outlay. Special relief to weavers sank to very small proportions. When it was found that they readily took to employment on the ordinary relief works, and physically improved through the labour, the Bombay Government ceased to make special arrangements for the weaver class, and left it to municipalities in which weavers were numerous to do so from municipal funds if they thought fit. On the recommendation of the Bombay Government the Imperial Legislative Council passed an Act (XII. of 1897) enabling municipal corporations to borrow money for this object. This Act, however, has been very sparingly resorted to by municipalities in Bombay Presidency, as it was found that the cost of the relief proposed to be given was out of all proportion to the number of persons to be relieved.

42. The fears of the local Government that such of the *rabi* crops as were sown after the November rain would, except where irrigated, fail to come to anything proved correct. In February and March the Director of the Agricultural Department after visiting the affected districts reported on their condition and the state of the crops. Of Sholapur he wrote: "Up to November large areas remained "altogether unsown. In that month rain fell heavily in the northern and central "portions of the district with the result that even more than the usual areas were

"sown with *rabi*. The crops on these, though germinating admirably, have come "to nothing but growth from 12 to 18 inches high, which will yield nothing "but a very little fodder for cattle." In Bijapur all vestiges of these November crops had disappeared. "It is difficult to conceive anything more distressing "than the appearance of the district as it presented itself to the eye of the observer "entering it from the north in the month of January. Except in the neighbour-"hood of wells and of the rivers, there was scarcely a blade of green to be "discerned. In the neighbouring parts of the Sholapur district the November "rain had encouraged the cultivators to sow large areas, and the land was covered "with the deceitful promise of a *rabi* crop. In Bijapur the country was as bare "as the palm of the hand." Bijapur and Sholapur were the worst districts. Bijapur virtually had no harvest at all, neither *kharif* or *rabi*, the total yield of the year representing less than one month's food for the population. In the seven Deccan districts inspected the total food-production of the year was returned at only one-fourth of the normal outturn.

Madras.

43. The first report of the Revenue Board which the Madras Government transmitted in November 1896 foreshadowed a widespread failure of crops in the northern districts, especially in the rice-tracts of Ganjam, and in the Deccan and parts of the Central districts. The deficiency in the September and October rainfall was very serious. The tract where the deficiency was greatest comprised a broad belt of country traversing the four Deccan districts of Bellary, Kurnool, Anantapur and Cuddapah—districts which are habitually liable to drought. The harvests of the two previous years had been good, and prices in the Deccan had in June 1896 fallen to the low level of the years preceding the great famine of 1876. Large stocks had accumulated, and but for the scarcity prevailing throughout India the province would have been exceptionally well able to withstand a bad year. But from September grain had been drained from it to Northern India, and prices had advanced by leaps and bounds under the influence of this export and from the reluctance of the cultivators to part with their stocks. Prophecies were current of a fatal three years' cycle of drought, and every well-to-do ryot locked up his remaining store of grain. The poorer classes were already hard pressed. There was little employment in the fields, and the immediate opening of relief works was necessary. The situation was said to be outside the experience of the present generation in famine administration. "Hitherto," wrote the Board, "it has been held that scarcity rates and famine "were the results of the failure of two or more seasons. In the present case the "failure of a single season has resulted in warning or scarcity rates, and for the "poorer classes, which habitually have to buy grain, the latter mean distress and "famine, unless their condition is alleviated."

44. In December the Revenue Board were able to report that heavy rain in the last week of November, followed by a copious north-east monsoon in the southern half of the Presidency, had materially reduced the scarcity area, and had brought about a substantial fall in prices. The affected area was now confined to the belt of country in the Deccan, with a population of $1\frac{1}{4}$ millions, and to parts of the Ganjam and Vizagapatam districts. Relief works in the form of road-repairs had been opened by the district authorities. On relief works and in kitchens about 20,000 persons were receiving relief, but the numbers were not increasing. The people were generally in good condition. The weaver class, a class which is very numerous in the Madras Presidency, was specially distressed owing to slackness of trade and absence of demand for textile goods, and relief at their own trade had been organized for weavers in Bellary and Cuddapah. No gratuitous relief in the homes of the people had as yet been found necessary. In Ganjam test-works had failed to attract labour. In the Deccan, fodder for the cattle was very scarce, and large numbers had been driven off to the Mysore pastures. Compared, however, with other parts of India the affected area in the Madras Presidency appeared from the report to be relatively small. Nor was it at first anticipated that relief on a large scale would be necessary. In the financial estimates for 1896–97 a sum of only 25 lacs for expenditure on famine relief in Madras was provided. But from April 1897 relief rapidly expanded, the expenditure soon outran the 25 lacs, and at the end of July when rain still held off in the south of India there were more persons on relief in Madras than in any other province.

In April the labour task was reduced and the daily wage raised by the local Government in the belief that the conditions of relief hitherto prevailing had been too stringent. Gratuitous relief in the homes of the people was also commenced on an extensive scale, and increased provision made for the special relief of weavers at their trade. To this change of policy the rapid growth of the numbers on relief must in a large measure be ascribed. It will be seen in the sequel that the Madras Government recognised that liberality had gone too far, and as the agricultural outlook improved it took steps to restrict relief within proper bounds.

Native States.

45. In Central India the probability of severe distress occurring in many of the States of Bundelkhand and Baghelkhand was recognised early in October 1896 by the Governor-General's Agent. Bad seasons had been experienced for three years, and many of the States, through no fault of their own, were at the end of their resources. The condition in Rewa, the largest State in Baghelkhand, was found to be very bad, and in Bundelkhand the population of the small States forming that Agency was much distressed. The question of funds was reported by the Governor-General's Agent to be very serious. In the Bundelkhand Agency but six out of twenty-three States had been able to make their own relief arrangements. As funds in the other States were exhausted, he obtained from the Government of India a loan of two lakhs on their behalf to keep the people alive. Shortly after this His Highness the Maharaja Sindhia of Gwalior volunteered to lend money to distressed States through British officers, and after the fullest enquiry and consideration the Governor-General's Agent was authorised to arrange such loans on the basis of interest at 4 per cent guaranteed by the British Government. These loans were to be made subject to the conditions that the resources of the applicant State were exhausted, that the Chief agreed to be guided by the Political Agent in famine matters, and agreed also that his State would be liable to be taken under direct management by the Indian Government on his failure to repay the loan. This arrangement has worked very well. The loans have been of invaluable assistance to the poorer States, while the conditions on which they have been made were well calculated to bring home to the rulers their responsibilities and to induce them to study and enforce economy. The loans were confined to States within the Central India Agency. Outside that Agency the States in which relief measures were needed were comparatively wealthy and did not require such assistance.

46. To advise the States in the administration of famine relief, to see that relief was being given wherever wanted, and that it was given on right principles, an officer, Lieutenant-Colonel A. P. Thornton, of the Political Department, was deputed to visit them in order. Bikanir was first visited, as complaints had been made by the Government of the Punjab that subjects of that State were crowding on to relief works in Punjab districts. From Bikanir he proceeded to Bhartpur and Dholpur, two other States in the Rajputana Agency, and thence to Gwalior, Bundelkhand and Baghelkhand. This tour proved very useful to the States concerned, and also fully informed the Government of India of the situation in each State. In the most affected States Assistant Political Officers were given to the Political Officer in charge, to enable him the more effectively to keep himself informed of the progress of relief and to advise the States. But care was at the same time taken not to impair in any way the responsibility of each State for providing for the relief of its subjects. Very praiseworthy efforts were in many cases made by the Chiefs, and a great deal of good work was done, though, as might be expected, in a less systematic way than the Famine Codes of British India contemplate. In the most distressed tracts relief measures occasionally lagged behind the requirements of the case, and the fact was at once proclaimed by the migration of the subjects of the State in troops to adjoining British districts. In the Nizam's Dominions serious distress was not at first apprehended, as heavy rain in November had done much good to the crops and had encouraged the cultivators to sow more land for a late crop. But as December and January went by without rain, the November sowings came to nothing, food became dear, and the agricultural labourers were without employment. The Nizam's Government promptly recognised the situation, and opened relief works, and suspended payment of the land-revenue, in the distressed tracts.

VI.—The second period. From the commencement of relief operations to the close of the spring harvest.

Growth of distress.

47. During this period the fate of the cold weather crops was decided and the distressed tracts became more distinctly defined. It has been already said that the out-turn of these crops was much below the average, partly because the areas sown were less and partly because sowings on unirrigated lands either failed to germinate or gave a very poor return. Thus the inequalities between field and field and between district and district in the matter of yield were much greater than in ordinary years. In the Bundelkhand districts and in Hissar, where there is very little artificial irrigation and where little rain fell during the winter months, the harvest was miserable and added little to local food stocks. Their exhaustion was seen in a continuous import of grain from other districts. In the Central and Northern Punjab, in the canal districts of the North-Western Provinces, and in parts of Oudh and Behar, much of the crop was good. From there grain was drawn to the distressed districts, and this demand, conjoined with the reluctance of the cultivators to sell, kept prices in these tracts up to famine level. In the Central Provinces the winter crop of 1896–97 occupied only three-fifths of its usual area and much of it was poor. Here also the spring harvest failed to replenish depleted local stocks or to bring down prices. Rice growing districts like Bilaspur and Raipur in the Chhattisgarh Division of the Central Provinces have no winter crops to speak of, and no alleviation in their condition through the spring harvest could be expected. In Ganjam and Vizagapatam in the Madras Presidency rice is likewise the staple crop, and here also the distressed tracts went from bad to worse. In the Bombay and Madras Deccan the late crops failed in most places, and their harvesting had no effect on prices or on the general condition of the people.

48. The growth of relief from the commencement of relief operations to the end of April 1897 is shown in the table below :—

Provinces.	Number of persons in receipt of relief at the end of each month.						
	October 1896.	November 1896.	December 1896.	January 1897.	February 1897.	March 1897.	April 1897.
Madras	—	28,410	26,330	42,363	65,835	104,955	231,650
Bombay	—	10,409	239,356	325,695	412,259	454,443	403,818
Bengal	—	3,384	91,410	338,810	410,002	535,333	678,972
North-Western Provinces and Oudh.	40,880	145,697	496,875	1,254,108	1,647,529	1,010,616	1,248,496

Native States.							
Hyderabad	—	—	—	—	4,509	4,414	26,843
Central India	15,969	Not reported.	30,876	69,062	137,040	100,246	149,596
Rajputana	8,019	34,807	47,254	25,041	19,469	29,808	21,690
Total ...	23,988	34,807	78,130	94,103	161,018	134,468	198,129
Grand Total ...	73,768	253,963	1,182,497	2,469,855	3,208,883	2,857,168	3,470,887

On the 30th April there were 3,272,758 persons in receipt of relief in British India and 198,129 persons in receipt of relief in Native States. The greatest number attained in any province during this period was 1,647,000 persons in the North-Western Provinces and Oudh at the end of February. In the middle of March the spring harvest in those provinces afforded employment in the fields and withdrew labourers from the relief works. In the Bundelkhand districts of the same provinces the ripening of the flower of the *mahua* tree (*Bassia latifolia*), which in a dried state is very largely used as an article of food throughout Central India, gave further employment to the people, and brought a supply of cheap food within their reach. All this tended to relieve the pressure on the relief works during March and accounts for the fall in the numbers on relief in the North-Western Provinces and Oudh at the close of the month. In April they again began to rise. The effect of the spring harvest in the Punjab is seen in the drop in the April numbers, the harvest there being later. In Bombay the fall in April was due to greater strictness in enforcing tests of distress, especially in the matter of allowances to non-working children. In other provinces the growth of relief is continuous throughout the period, and any tendency which the spring harvest had to draw labour off the relief works was more than counterbalanced by the extension of relief into new areas as the area of distress widened.

Analysis of relief at end of April.

49. As relief varies in character according to the circumstances and physical powers of persons relieved, an analysis of the aggregate volume of relief given on the last day of April is of interest. This is effected by the figures below :—

Provinces.	Employed on Relief Works.			Employed on test works.	Total employed on works.	Gratuitously Relieved.			Grand Total.
	Workers.	Dependants.	Total.			In poorhouses or kitchens.	In their homes.	Total.	
Madras	184,207	10,266	194,473	7,202	201,675	4,267	25,708	29,975	231,650
Bombay	292,752	79,477	372,229	973	373,202	434	30,182	30,616	403,818
Bengal	345,037	31,998	377,035	9,513	386,548	3,244	289,180	292,424	678,972
North-Western Provinces and Oudh.	781,843	145,588	927,431	7,455	934,886	26,819	286,791	313,610	1,248,496

Gratuitous relief in the homes of the people.

50. From these figures it will be seen that more than three-fourths of the persons relieved were employed on public works, the remainder being shown as gratuitously relieved. Labour for all who can do a reasonable amount of work, and gratuitous relief, as far as possible in their villages, for persons incapable of labour, constitute the two main divisions of famine relief. For wanderers and professional beggars poorhouses are provided, but except in the North-Western Provinces and Oudh and the Central Provinces the number of persons so relieved was very small. Gratuitous relief in villages was given most extensively in the two provinces of Bengal and the North-Western Provinces and Oudh, and in Bengal the number of

persons so relieved bore a very high proportion to the number on works. In other provinces up to the end of April this form of relief was sparingly resorted to. In the next period of the famine a very marked change in this respect will be seen in the Central Provinces. No subject during the late famine has been more continuously under observation and discussion than the proper limits of this system of "outdoor" relief in the homes of the people, and it undoubtedly constitutes one of the most difficult and delicate questions in famine administration. A few remarks on the point may therefore not be out of place. The Famine Commission show that in the earlier famines the obligation of relieving persons other than the able-bodied was not recognised by the State, and was considered to rest with the charitable public. The first step to the recognition of the responsibility of the State in this respect was by the institution of poor-houses or kitchens where relief was given in the form of cooked food, with or without the condition of residence. The next step was taken in the Behar famine of 1873-74, when village inspection and village relief were prominent features of Sir Richard Temple's organization. The country was mapped out into small circles, each superintended by a relieving officer, and it was made his duty to discover within his circle all cases of distress which could not be met by the offer of employment on works, and to arrange for the weekly or monthly distribution to such persons of doles of grain or money, availing himself, so far as was possible, of the services of the village headman. The Famine Commission clearly recognised that under this system where no test of distress can be applied the difficulty of distinguishing the worthy from the unworthy must be great. But they noted the fact that the poor-house system was regarded by the people with extreme repulsion, and that it involved the uprooting of families from their homes and the breaking up of social bonds. The Famine Commission accordingly came to the conclusion that the village system was preferable for general adoption "insomuch as, while this system may "involve the risk of a too free grant of relief, the poor-house system involves the "more serious risk of insufficient relief." To it they looked for the prevention of the wandering of the poor in famine time, "which leads to the dissolution of the "village communities, and is one of the principal causes of famine mortality." They thought that if work on the task system commensurate with the capacity of each labourer was offered to all persons capable of doing a reasonable amount of work, the incapable poor who would be supplied with food in their homes would not form a large percentage of the population; and they believed that by means of a complete chain of inspectors in each local area with a European officer at their head abuses could be prevented. The system of gratuitous relief approved by the Famine Commission has been introduced into the Famine Codes, but the present is the first occasion since they were framed on which it has been extensively applied. In the Behar districts of Bengal the percentage of persons gratuitously relieved in their homes was as high as 5 and 6 per cent. of the total population of the distressed tracts. In the North-Western Provinces and Oudh the proportion has exceeded 3 per cent. in three or four districts only, while in many districts it was less than 1 per cent. In either province special pains have been taken to make the supervision efficient and to confine relief to deserving cases, and in either province the local Government is satisfied that it has been the means of keeping together the village and family organization and in preventing wandering and mortality. The intensity of the famine in parts of the North-Western Provinces and Oudh was such that gratuitous relief in the homes of the people on a large scale was inevitable. But the Bengal figures gave cause to inquiries on the part of the Government of India. The local Government has explained them by reference to the chronic poverty of the dense population of Behar and to the rapid drying up of the springs of private charity as a consequence of this poverty on the first approach of hard times. The great preponderance given in Bengal to gratuitous relief still, however, remains singular and as yet not fully explained. It may be the case that necessitous cases were more completely tracked out in Behar by the very strong relief establishments entertained there, than was possible in other provinces where the staff was weaker and the area of distress more extensive. It is also probable that the strictness with which tasks have been enforced on the relief works in Behar indirectly resulted in a comparatively large number of persons being placed on gratuitous relief, since they were found unable to perform what was held to be a reasonable amount of work. In other provinces where less attention was paid to the amount of work obtained from the relief workers, persons were admitted to the

works whose labour was of a nominal character, while the number of women and children among the workers was much in excess of what was required or could be profitably employed. This was in accordance with the principle that it is better to accept all inefficient labourers offering themselves than to place them on gratuitous relief in their homes. Though the labour they are capable of may be of little or no value, they submit, it is held, to a distinct test of distress in the very act of appearing on a relief work. In Bengal inefficient labourers were in principle admitted to the relief works, and the local Government after inquiry came to the conclusion that the gratuitous lists contained the names of no persons who were capable of labour. But there is little doubt that inefficient labourers were in smaller proportion on relief works in Bengal than elsewhere. This appears both from the comparatively few women and children on relief works in Bengal, and from the high tasks which were obtained from the gangs. A difference of system in the management of relief works is indicated, which on the face of it had something to do with the large numbers in Behar on gratuitous relief in their homes. Such divergencies in the methods of relief administration in the different provinces do not necessarily imply that one province has been right and the other wrong. The cause may lie in the special circumstances of the case. In Behar the relief works were small and numerous and within easy reach of every village. If great attention had not been paid to exacting a high task from the labourers and thus indirectly eliminating inefficient persons, the works would have attracted unmanageable crowds, and this might have been a greater danger than some excess in the matter of gratuitous relief. It may also be mentioned in noticing the high percentage of gratuitous relief in the homes of the people in Behar that in other provinces more gratuitous relief on the relief works themselves was given than was the case in Behar. Under what conditions and to what classes this second form of gratuitous relief is given will be explained later on when the system of relief works is discussed.

51. In the Central Provinces the scattered and sparse population, the migratory habits of the aboriginal races, the defective communications, and the weakness of the establishments at the disposal of the administration, made the effective organisation of village relief peculiarly arduous. Pending its completion the expedient of "relief centres," where food was supplied to all comers in obvious need of relief, was provisionally adopted. To these relief centres was often attached a small relief work, such as the excavation of a village tank or the repairing of a road, and when this was the case able-bodied applicants for relief were required to perform a task as the condition of relief. These centres proved very useful in the wilder tracts, and as a simple and summary method of relief they were frequently resorted to in places where distress unexpectedly made its appearance before regular relief works could be opened. But they tended to become unmanageable as the applicants for relief increased, and were gradually discarded, except in the wilder tracts, as relief operations were systematised. Both in poor-houses and in relief centres in the Central Provinces the mortality was very high in the early months of the famine and attracted public attention. The death statistics of these institutions collated by the local Administration show that a large proportion of the deaths were those of wanderers from native territory or other parts of India. This was especially the case in the Nerbadda valley districts which form the natural channel of communication between Central India and the fertile south, and which in all seasons are resorted to for work and food by thousands of immigrants from the north. But many of the deaths were those of aborigines or of residents of other districts of the province, indicating the prevalence of wandering to a lamentable extent. This aimless wandering of hunger-stricken persons has often characterised great famines in the past, and however vigilant the administration, it is likely to occur in broken forest country among people who largely subsist on wild fruits and grasses and who still retain the nomad's instinct. Many of the difficulties which have arisen in the Central Provinces in the late famine can be traced to this source.

In Madras and Bombay during this period the administration of poor-houses and gratuitous relief in villages presents no features of special interest.

Gratuitous relief to "dependants"

52. Turning now to the main branch of famine relief—the relief works—the gratuitous relief given in connection with them may in the first place be noticed. The wage earned by a relief-worker is not intended to be more than a subsistence

wage. If therefore the people come in families to the relief works, there will be a certain number of children below the working age, and of infirm adults, to be provided for. The Famine Codes allow these non-workers to be gratuitously relieved as "dependants" of the relief-workers, the relief taking the form of money or cooked food. The proportion of dependants to the workers varied greatly, as will be seen from the analysis of the population on relief at the end of April, in different provinces. It was 18 per cent. in the North-Western Provinces and Oudh, and 26 per cent. in Bombay. In Bengal and Madras it was only 9 per cent. and 5 per cent. respectively. These variations were due to the relative extent to which in each province the relief-work population resided on the works; and the practice of residence again depended on the distance of the works from the homes of the people, and on the degree to which residence on them was encouraged, or was enforced as a test of distress. In the North-Western Provinces and in Bombay large works at considerable intervals were the rule, and residence on them was practically obligatory for the majority of the workers, coming as they did from long distances. Whole families settled down on the works, and the non-working members had to be gratuitously relieved. In Bengal the works were so numerous and scattered that there was very little residence on them. The workers came from and returned to their villages daily, and their wives and children, if entitled to gratuitous relief, were relieved in their homes, and not as "dependants" on the works. The same was the case in Madras.

53. To the relief worker the gratuitous relief of his "dependants" is very attractive, especially when it takes the form of cash. In Bombay the large number of non-working children brought by women to the works in the first months of the scarcity led to inquiry which resulted in the discovery that many of the children belonged to persons who did not attend the works and that they were lent for the occasion. This practice was stopped by the institution of children's kitchens in connection with the works and the discontinuance of the money dole. Elsewhere a similar change was necessitated by the neglect of parents to feed their children, though receiving money for their food. It was found that they either spent the extra allowance on themselves, or saved it against the day when the works would be closed. Famine weakens family affections, and there is no clearer sign of its severity in a given locality than the condition of the children. Wherever children's kitchens were substituted for cash allowances an immediate improvement in the health of the children ensued. The experience of the late famine is conclusive on the point that when distress becomes severe, parents cannot be trusted to provide for their offspring.

54. This fact constitutes one of the arguments in favour of the retention of the present relief wage system of the Famine Codes, demoralizing though it may seem in some of its aspects. Under this system the relief worker, whatever may be his working capacity, is restricted to a bare subsistence wage. The extra allowances receivable by him for non-working members of his family depend not on his industry but on the size of the family. The alternative system, which is not without its advocates, is to permit the worker to earn enough by exceptional industry to support himself and the persons dependent upon him. It is easy to see that this would result in the State paying many of the workers more than they actually require for their own subsistence, without any guarantee that the young, the aged and infirm would be kept alive. When distress is slight this consideration has not the same force, and if sufficient wages are offered to the people the care of their dependants may be left to the able-bodied as in ordinary times. In slightly affected areas during the late famine several varieties of the piece-work system, under which the worker is permitted, in proportion to his industry and skill, to earn a wage in excess of a bare subsistence for himself and receives no separate allowance for his dependants, were tried with success.

The organization of relief works.

55. The first period of the famine was occupied in all provinces with the organization of relief works, and in connection with this the disposition of famine labour to the best advantage received much attention. Such disposition includes (*a*) the selection of suitable works of permanent public utility; (*b*) the management of the works by a competent staff; (*c*) the proper classification and remuneration of the relief workers; (*d*) the proper tasking of the workers; (*e*) the adoption of other self-acting tests of distress.

56. The selection of suitable works for the employment of relief workers is a matter of greater difficulty than it at first sight seems. Under the ideal system there should be in every distressed area one or more projects of permament utility, specially prepared and reserved for the emergency of a famine. Such projects should be capable of giving employment to a large body of labourers for several months, and as the labour is unskilled, they should preferentially consist of earthwork or of quarrying and preparing metal for roads. Railway earthwork, canal and drainage excavation, road-making and road-repairs, and tank construction almost exhaust the category of such possible works. But there are many districts for which no new railways are proposed, in which no canal can be made, and where tanks of large size for irrigation purposes are not required. In such cases road earthwork and the collection of metal are usually the one form of labour on which the relief population can be employed, and the quantity of such work that can usefully be undertaken is necessarily limited. The Punjab was fortunate in having two canal projects (the Ghaggar canal in the Hissar district and the Jhelum canal in the Gujrat district) ready for immediate execution in the distressed tracts, besides the earthwork for several branch railways. In Upper Burma canal projects were also available. In Bombay the collection of road-metal was first resorted to, but when it was seen that a supply sufficient to last for years was being accumulated, several large tank projects for irrigation purposes and railway earthwork were commenced. In Madras there was a singular scarcity of large projects of permanent utility, and the relief gangs have been employed on road repairs and the collection of road metal. In the Central Provinces the earthwork of the Raipur-Dhamtari railway gave some employment in the Raipur district, and that of the Katni-Saugor railway in the Saugor district; but road-work here also has been the chief resource. In the North-Western Provinces and Oudh also road-work has been the chief form of employment, and in the worst districts every existing unmetalled road has been put into thorough repair and often raised and widened, and many new roads constructed. Village and road side tanks within a certain distance from each road so operated upon were also deepened and improved as part of the road project. In the North-Western Provinces and Oudh and to a lesser extent in the Central Provinces the road-works, which were almost invariably large works giving employment in each case to 2,000 workers and upwards, were supplemented by numerous small works, such as village roads and tanks, for the employment of small bodies of labourers. The difficulty of effective supervision over such scattered works was recognised, and to meet it the aid of the local landowners was called in. They would agree to construct a given village work for a certain sum, covenanting to employ distressed persons only and to pay them famine wages. In some cases the cost was shared between the landowner and the Government, in others the Government bore the whole cost. But in either case the landowner had a strong pecuniary interest in getting a full day's work out of the labourers. No return of the village works constructed through this agency has yet been received, but they are known to have been numerous, especially in the Allahabad Division of the North-Western Provinces and in the Chhattisgarh Division of the Central Provinces, where the country lends itself to the construction of small tanks for the storage of water. As subsidiary to large works under direct State management these "village works" have proved very useful, but neither in the Central Provinces nor in the North-Western Provinces has it been found safe to trust to them alone. A backbone of large works on which labourers can be employed in thousands under strict professional supervision and control was held in both provinces to be essential. In Bengal there were no large projects ready in the first months of the famine, and, owing to the character of the country, tanks were preferred in Behar to road-making. A few of the tank projects were large, but the majority were virtually "village works." And, being comparatively small, the works opened in each district were necessarily very numerous. Effective supervision would not have been possible had not the special famine establishments in Behar been exceptionally strong.

(*a.*) The works selected.

57. From what has been said above, it will be understood that there is less to show in the way of permanent public utility for the enormous quantity of famine

relief labour which has been employed by the State than could be wished. This is more or less inevitable whenever labour is employed for reasons other than because it is wanted. But more attention may usefully be directed in future by local Governments to the preparation of famine-relief projects, especially in provinces where during the late famine difficulty has been experienced in providing large works of undeniable utility.

(*b.*) The controlling staff.

Except in Bengal, where, owing to the numerical weakness of the Public Works Department it was found necessary at first to place almost all relief works under the civil officers, the immediate direction of the larger relief works was from the outset entrusted to officers of the Public Works Department. But as such works are carried on on the principle of giving effectual relief to the labouring population and not of getting the greatest quantity of work done at the cheapest rate, civil officers were associated with the officers of the Public Works Department to see that the labourers were correctly classified and properly paid and tasked according to their strength. In such a system of dual control there is obviously room for discussion as to the limits of the respective powers of the civil and professional authorities unless they are clearly defined beforehand. The Famine Codes have been found to be wanting in precision in this respect, though fortunately in most provinces this has not been productive of many difficulties. In Madras a certain amount of friction appears to have arisen, and the professional officers would seem to have been subordinated to the civil authorities to a greater extent than elsewhere. The question chiefly arises as regards the regulation of tasks and the imposition of fines for short work. Viewed in the light of results the Madras practice compared unfavourably with that of other provinces where greater powers in all that appertains to the technical management of relief works were given to the Department of Public Works.

(*c.*) The classification and wages of the workers.

58. The classification and wages of the relief workers are prescribed in much detail by rules in the Famine Codes which elaborate the principle laid down by the Famine Commission that to all who can do a reasonable amount of work shall be given "a task carefully adjusted to their powers" and "a wage on which life and health can be maintained." These rules are in the main based on the experience gained in recent scarcities. But they had not been tested on a large scale, and the test to which this year they have been subjected has shown that they are capable of improvement. In some respects their provisions are imperfect and in others greater flexibility of system is desirable to suit the very diverse conditions which the famine administrator has to meet. The first in the field in the matter was the Government of the North-Western Provinces and Oudh. Profiting by its experience in the previous year in Bundelkhand that Government supplemented its Famine Code by a large body of instructions which appear to have worked well, and which in substance were adopted in Bengal and the Central Provinces. In the classification of the relief-workers and the wage-scale some important changes were made. The Famine Codes recognise four classes of labourers—the professional digger or navvy, the able-bodied worker who is not a professional but who is accustomed to hard manual labour, the able-bodied person who is not accustomed to manual labour, and the weakly person. It is contemplated that these four classes of workers should do tasks graduated according to their respective capacities, and be paid according to a graduated wage scale. In this scale the wage for each class is a ration of so many ounces of flour and pulse, with a little salt and condiments, converted into cash according to the market price of the ration. At the bottom of the scale is the wage of the weakly person whose employment is presumably nominal, and who is presumed to require less food than the able-bodied workers. The wages of the other three classes are built up from this minimum wage. The Government of the North-Western Provinces and Oudh in its instructions simplified this classification. As the relief workers are ordinarily employed on earthwork of the simplest kind, needing only two classes of labourers—the digger and the carrier—the instructions recognised two classes of workers only, and two rates of wage. The carriers who formed the great mass of the workers and who were chiefly women and children, received a wage which was practically the minimum wage of the Code. The digger received a somewhat

higher wage. When the price of grain was Re. 1 for 10 seers, the digger's wage was $1\frac{3}{4}$ annas and the adult carrier's $1\frac{1}{4}$ annas. The child over 12 received 1 anna and the child between 7 and 12 half an anna. Under this system the average remuneration of the famine labourers was less than what it would have been under the Code. But it seems to have been found sufficient to keep the workers in good health. For Sundays they received a holiday wage, and additional allowances for the non-working members of the family. In this way the aggregate wages of a family of five persons possibly amounted to Rs. 8 or Rs. 10 a month. With food at normal prices this would be riches to an Indian villager: and even with food at famine prices it is said to have allowed a small margin for saving.

59. While the wage-scale of the Code was considered in Upper India to be if any thing too liberal, it was found fault with in Madras for being too low. Influenced by the reports of its Sanitary Commissioner on the condition of the relief work population, the Government of Madras represented to the Government of India that the lower grades of the wage scale were insufficient to maintain workers in good health. Into the details of the discussion it is unnecessary to go. The view taken by the Government of India was that the scale had been found sufficient in other provinces, especially in Bombay where the conditions of life were very similar, and that a case for raising it and thereby augmenting the already very heavy expenditure on famine relief was not made out to their satisfaction. The Government of Madras acquiesced in this conclusion and the matter dropped.

60. Thus the final word on the question of the famine wage and the classification of famine workers has yet to be spoken. When the Provincial Governments come to review the famine operations in which they have been engaged and to consider the bearing of the experience so acquired on the Famine Codes, this question among others will engage attention. The reports of the officer deputed by the Government of India to inspect the relief works in all the provinces deal fully with it and will greatly assist to its solution. It may possibly be that no absolute wage standard, which is under all circumstances sufficient for the worker's support and not more than sufficient, can be laid down. A wage that is sufficient in a slightly distressed tract or at the commencement of a scarcity, when the workers have still some resources of their own, and when there is a risk of withdrawing them unnecessarily from their ordinary employments, may be insufficient during acute distress, or in the late stage of famine. It is a primary principle that at no time should the wage be such as to attract labour which otherwise could support itself. And when this happens, the wage has to be reduced below even the theoretical bare subsistence allowance, or else the other conditions of the relief, such as the amount of the task or the Sunday dole or the allowances for "dependants" have to be modified.

61. The proper tasking of the workers is, to quote the Famine Commissioners, required "to prevent the relief work "from being so light or unduly attractive as "to induce any to remain who are not really in want." To this matter much attention has been directed, especially in the first period of the famine. The system at first adopted in the North-Western Provinces and Oudh was to group the relief-workers into gangs of 60 or 80, of whom about one-fourth were able-bodied diggers and the rest carriers, and to fix a daily task (of so many cubic feet of earth dug and carried) for the gang. As the carriers were usually in excess of the number actually required, any deficiency in work was the fault of the diggers. This led to the rule that if the work of the gang was short, the diggers and the diggers only were fined. As experience was gained in the management of large bodies of relief-workers and the supervising establishments became more expert, it was found possible in place of dealing with the gang as a unit to mark out the day's task for each digger, and to enforce its performance on each individual. In Bengal a smaller unit than the gang of 80 was adopted, but in other respects the system of tasking resembled that in force in the North-Western Provinces and Oudh. In all provinces the enforcement of a reasonable labour task was found to be hampered by two circumstances peculiar to the employment of famine relief-workers. The first is that the number of women and children and other inefficient workers seeking employment is usually much in excess of the efficient

(*d.*) The tasking of the workers.
